The notion of “just transitions” embodies the idea that the transition to a low-carbon economy must be equitable, fair, and just in not disproportionately pushing burdens on to particular groups, communities, etc. This alludes to a systems perspective in recognizing the interconnectedness across systems that results from impacts and responses. Climate change mitigation involves actions that pose dilemmas or require balancing between differing and conflicting interests (Hulme 2009; Hoffmann 2011). To take a common example, climate change mitigation has spurred projects in many countries to shift to low-carbon energy sources, such as wind, solar, and hydro energy. In occupying land or affecting water sources, such activities are known to impact the rights to land, property, or livestock grazing of those who own, live on or otherwise depend on the area for their livelihoods. A similar case can be made for mines for minerals required for wind or solar energy technologies and storage. Protests and court cases in multiple countries testify to discontent. Moreover, vulnerable groups such as indigenous peoples are often particularly at risk of such harmful impacts resulting from the

transition. In parts of Europe and the United States, the transition poses challenges to employment of those previously working in fossil-fuel production.

In the Global South as well as in the Arctic High North, several incidents related to wind farm siting demonstrate that companies seen to be involved in harmful impacts on local communities can suffer loss of social license to operate and loss of business opportunities (e.g., Buhmann et al. [forthcoming](#)). In such contexts, companies with a corporate sustainability commitment can benefit from appreciating the systemic interconnectedness as an explanation for the effects. As a foundation for commitments to addressing the dilemmas, they may also be guided by the moral ideas informing CSR. However, even the systems view of corporate sustainability or the moral guidance of CSR may not provide sufficiently detailed indications for a company on how to balance economic involvement in the urgent transition and undesired and unintended harmful impacts on affected local communities. In this regard, companies may seek more detailed guidance from the concept of risk-based due diligence. Risk-based due diligence is a process for companies to identifying and managing harmful impacts (OECD 2011). In the corporate responsibility context, its management implications are spelled out in the UN Guiding Principles on Business and Human Rights (UN 2011) → *The UN Guiding Principles and Transnational business governance*, which are explicitly referenced by the implementation provisions of Agenda 2030. Meaningful engagement with affected stakeholders (including rights-holders, that is, whose human rights are at risk due to the economic activity) forms an integrated part of risk-based due diligence. The aim is to identify risks from the perspective of those affected and to involve them in planning and checking the effectiveness of preventative and mitigation measures. Focused on risks caused by the company (directly or through its business relations) to society rather than risks to the company itself, risk-based due diligence represents a pragmatic but principled approach to business in society, strongly integrated in the reality of business interaction with

the social system as well as environmental impacts. In a just transition context, due diligence can help a company identify and manage harmful impacts on affected stakeholders and work with those stakeholders to reach solutions that are acceptable to all.

## Conclusion

Climate change is a pressing challenge to sustainable development. Corporate sustainability assumes that companies take a systems perspective to their impacts on society, inspired by natural science views on the interconnectedness the ecosystem and its environmental, social, and economic elements. CSR differs by taking its cue from moral views on the role of the firm. The urgency of reducing greenhouse gases has led to governmental commitments under the Paris Agreement and Agenda 2030, and company commitments. Companies are required or expected to shift to low-carbon energy and to become involved in activities to ensure climate change mitigation, adaptation and resilience, and consideration of vulnerable groups most at risk. The idea of a just transition assumes that such actions are undertaken in a manner that balances the urgent need for climate change action with the needs and rights of those who are or can be at risk of harmful impacts from such responses. To operationalize the systems oriented ideals of corporate sustainability and the moral ideals of CSR in this context, the approach of risk-based due diligence and its emphasis on meaningful engagement with affected stakeholders can prove useful.

## Corporations and Duties to the Global Poor

### Introduction

In a world characterized by intense global poverty, do active corporate efforts to help the global poor constitute discretionary acts of charity, to be praised but not to be thought of as mandatory? Or, conversely, are such efforts a matter of binding moral duty? The traditional position among business ethicists – and still, perhaps, the dominant one – is that there is no such duty, except perhaps in exceptional circumstances such as rescue cases (see Dunfee 2006). In recent years, however, several authors have made the case that corporations have quite wide-ranging positive duties to the global poor. This entry outlines the contours of the various arguments given in favor of the latter position, before highlighting two theoretical challenges which arise if we are to embrace this position – first, the issue of determining what sorts of actions count as adequately fulfilling positive duties to the global poor, and second, the question of what limits there are, if any, to the demandingness of corporations’ positive duties.

Before this, it is worth clarifying a few terms as they are used in this entry: duties, positive duties, and the global poor. We can treat “duties” (or,

synonymously for present purposes, “obligations,” or “responsibilities”) as follows: Duties to X are very strong reasons to X, of a sort which typically override all other reasons not to X (The exception being where there is a conflicting and more stringent duty to Y). Where agents fail to fulfill their duties, they are answerable for this – they must justify not doing so, and they are on the hook for blame if they fail. On this rendering of a duty, what Thomas Donaldson calls “maximal duties” – whose fulfillment would be “praiseworthy” but “mandatory” (1989, 62) – would not count for present purposes.

Positive duties can be contrasted with negative duties, where the former involve taking active steps to protect or help certain actors or morally important goals. Negative duties, by contrast, require agents to refrain from certain actions, such as harming others. In practice, the distinction between the two can be blurry, but for present purposes it is a helpful binary to bring out the issue at stake – whether corporations are morally required to go out of their way to help the global poor. (Nobody denies that corporations have at least some negative duties to the global poor – they have duties not to pollute nearby rivers, dump toxic waste unsafely, undermine political accountability by paying bribes to officials, and so on.)

Finally, by “the global poor” here, I refer to those agents who are so badly off that some of their basic needs – those needs that all humans typically need fulfilled in order to live a decent, relatively healthy life – go chronically and systematically unmet as a result of a lack of income and wealth. Various proxies are available to help specify who constitutes a member of the global poor – there are various internationally recognized poverty lines, there are multidimensional studies of poverty, and there is the human development index – but there is probably no great value in trying to be too wedded to any one metric to determine who, fundamentally, suffers from an intensive needs shortfall of the relevant sort. One important basic observation, borne out by all these various indicators, is that global poverty is concentrated overwhelmingly in certain areas – most notably in Sub-Saharan Africa, but to lesser

extents in places like South Asia and small island nation-states. Over and above definitional questions, to talk of duties owed to “the global poor” here is to set up a contrast. What this entry is not interested in is what duties are owed to specific stakeholders, poor or otherwise, who are already directly tied in with a corporation’s operations. Instead, we are interested here in whether a corporation has duties to the global poor simply on the basis of the latter’s poverty. Why, though, would corporations with no direct ties to the global poor nonetheless owe the global poor a suite of positive duties? Three arguments have been given which are worth outlining, which we can label the “authority,” “capability,” and “dependence” accounts, respectively.

### The Authority View

Florian Wettstein’s work represents perhaps the most extensive defense of corporation’s positive duties in the literature (including but not limited to those owed to the global poor). Wettstein has given several distinct arguments for the existence of various positive corporate duties. At root of all these, however, is a diagnosis of a change in global political economy over recent decades, and a concomitant recognition of the now central determining role that corporations, particularly multinational corporations, play in the global order and the global allocation of goods (see Wettstein 2009, 2012). The primary focus here is on corporations as rule-makers and shapers. While no individual corporation plays the role of global rule-shaper, corporations can and do coordinate and collaborate with one another on various issues. That this is a live possibility for corporations, combined with the fact that they collectively play such a central organizing role in the global economy, entails that corporations can be taken to be quasi-governmental institutions. Those who occupy governmental positions (or, in this case, quasi-governmental ones) are fairly saddled with ethical demands on what they exercise their governmental powers for. Corporations, then, inherit positive duties within the global economy on the

basis of the authoritative role they play within the global economy. To the extent that the global poor are deeply enmeshed in, and deeply affected by, the vagaries of the global economy, this gives them claims upon how corporations fulfill their quasi-governmental functions within this system.

### Capability

Recently, Brian Berkey (2021) has put forward a more streamlined argument for corporate positive duties to the global poor, one that does not rely on any deep or contentious interpretation of the role that corporations play in the global economy. In fact, Berkey gives several arguments for the existence of positive corporate responsibilities to the global poor. He notes, for instance, that corporations are beneficiaries of structural injustice that the global poor suffer from, and beneficiaries of such injustice typically have responsibilities to benefit those who are disadvantaged by the relevant injustice. He also argues that some corporate decisions, such as where to relocate a new production site, are distributive decisions, and so should be judged accordingly – and many distributive theories speak in favor of prioritizing the worst-off. While ordinary common sense might tell us that corporations have no duty to move to a poor country when locating closer to home is viable, Berkey compares favoring unemployed workers in the developed world over those among the global poor to giving a certain life-saving medicine to someone suffering from moderate back pain, rather than to someone who will die without it. But the argument most central to Berkey’s case is what we might call the capability argument: Some corporations are extraordinarily well resourced, and hence capable of rectifying some of the global deprivation the global poor suffer from. Insofar as we often attribute duties to those most capable of bearing them, Berkey argues this combination of facts alone constitutes a powerful and intuitively compelling argument for why corporations owe duties to the global poor.

## Dependence

More recently still, Tadhg Ó Laoghaire has developed a dependence-based account of why corporations have duties to the global poor. On Ó Laoghaire's account, one agent depends upon another to the extent that the latter "plays a role in how the former will or has the best chance to meet their own needs" (2022). That dependence generates duties where the needs at stake are core needs, he argues, is a central and basic part of our moral thinking – it accounts for why we have duties of rescue, why we attribute demanding duties to parents toward their children, and much more besides. And, because integration into corporate value chains constitutes perhaps the most promising route to poor countries' development, the global poor can be said to depend in this way upon corporations; hence they have claims against corporations. The dependence-based account can be seen to inherit elements from each of the previous two accounts. Like the authority account, it highlights the role that corporations play in the global economy and attributes positive duties to them on the basis of their role. Whereas Wettstein highlights the role of corporations as rule-makers in the global economy, Ó Laoghaire instead highlights their role as gatekeepers of economic opportunities, particularly export opportunities of the sort needed by developing and least-developed countries to further their own development. It is not their role as governance institutions that matters, on this account, but their integrality to the future prospects of the global poor. Similarly, the dependence account emphasizes the capabilities that corporations have to improve the condition of the global poor as part of the reason why duties are owed but notes that these capabilities only ground onerous duties because corporations' activities are central determinants of whether or not the global poor can improve their condition. In a world where domestic corporations were wealthy and powerful, but the international economy was not integrated and global value chains did not cross the globe, the moral claims of the global poor upon corporations in other jurisdictions would be considerably weaker than they are in a world like our own.

## How to Fulfill Duties to the Global Poor

These three accounts of what grounds corporate duties need not be seen as mutually exclusive – they could each ground corporate duties to the global poor, in which case we might say that such duties are overdetermined. But the three accounts may lend themselves – though not, perhaps, in any deterministic way – to different accounts of what, precisely, corporations owe to the global poor. In his own work, for instance, Wettstein often focuses on what he, following Young (2011), calls the political duties of corporations (whether to the global poor or otherwise) – communicative responsibilities intended to contribute to collective action targeted at rectifying injustices. By contrast, the capability approach lends itself most obviously to calls for corporations to distribute some of their resources to the global poor, while the dependence approach lends itself most readily to calls for corporations to play a more enabling role in poor countries' development – whether through political action or more directly through, e.g., relocating their operations.

It is important to distinguish this issue – what form of action corporations owe the global poor – from the thornier issue of how to determine which instances of corporate action count as fulfilling a duty to the global poor. The challenge with answering the second question relates to the difficulties of identifying who constitutes the global poor in the first place. To see the issue, it is worth turning to Berkey's work. In the paper where he argues that there are positive duties owed to the global poor, he gets the reader to imagine the following scenario:

*New Production Site: Company M, a successful US-based MNC that manufactures clothing, is deciding where to locate a new production site that will employ one thousand people. Although there are thousands of locations around the world that would work well, the company has narrowed the options to: (1) town X, in the US; (2) town Y, in China; and (3) town Z, in Bangladesh. In all three of these locations, there would be more than enough people who would be eager to take the jobs, and all of them would genuinely benefit from being hired and paid locally prevailing wages to work in locally prevailing conditions (e.g. hours, safety). These would be sweatshop conditions in Z, as well as in Y, although the conditions in Y, including wages, would be somewhat better.*

Berkey gives a numerical value to represent the level of well-being to prospective workers in each area, with X having a considerably higher level than Y, and Y having a marginally higher level than Z. He also argues that, in light of these levels of welfare, M would have a duty to locate to town Y or to town Z, given the existence of positive duties to the global poor. But note that this is not the only conclusion, or even necessarily the most plausible conclusion, that we might draw; we might also think that M has a duty to locate in town Z specifically, insofar as this is the worst-off among the regions in which the site appears to be viable. From this, we can see that there are (at least) two approaches to thinking about duties owed to the global poor. On the one hand, “the global poor” constitute a set of agents whose standard of living is below a certain threshold, and improving the lot of any one of them constitutes at least a *pro tanto* contribution to fulfilling one’s duties to the global poor. On this rendering, M locating in either Y or Z might equally constitute means of fulfilling duties to the global poor. On the other hand, “duties to the global poor” is better thought of as a designator to identify duties owed on the basis of some agents’ severe deprivation. Proper responsiveness to the source of such duties speaks in favor of prioritizing the very worst-off agents – in which case M would have to move to Z specifically, rather than X or Y. In general, little extensive work has been done on how corporations ought to determine the precise contours of their duties to the global poor, and when we ought to judge that they have done enough and acted with a defensible set of priorities. Hashing out the philosophical strengths and weaknesses of each of these positions – and identifying further potential positions – will be one of the key tasks of future research.

### Duties, Limits, and the Role of the Corporation

An implication of granting that there are duties owed to the global poor is that corporations may be on the hook for considerably more claims than we are accustomed to acknowledging. Indeed, we might wish to deny that duties to the global poor

exist precisely because of this implication – if corporations owe duties to the global poor on the basis of the latter’s deprivation, after all, this presents the possibility that moral duties would eat into a corporation’s moral permission to seek any sort of profit at all. This thought seems to motivate – sometimes implicitly – several cases where authors have denied the existence of extensive corporate duties to the global poor. In some cases, it is treated as more or less self-evident that corporations cannot possibly be on the hook for such a demanding and expansive set of duties (e.g., Dunfee 2006; Wood 2012). In other cases, the implication is rejected because, among other things, it is seen to conflict with corporations’ primary responsibilities, which are to render economic activity more efficient and contribute to the welfare of the societies in which they are already located (e.g., Donaldson 1989).

The demandingness of positive duties raises tricky issues for all sides of the debate. For those who argue that there are corporate duties owed to the global poor, they need to be able to specify when it is that corporations can withhold their resources from further fulfillment of this duty – corporations presumably cannot be expected to run themselves into the ground, after all. Ó Laoghaire gives one response to this worry, where he argues that corporations are entitled to prioritize meeting the core needs of their current stakeholders before being bound to further the needs of the global poor – hence what places a limit on the dependence-based duties to the global poor is the dependence-based duties of the corporation’s already-existing relationships. In the case of those who reject the existence of positive duties owed to the global poor, the challenge is how to reconcile this with other intuitively compelling moral judgments. One such judgment is that, in rescue cases, there are indeed positive duties owed to those in grave need – if a child is drowning in a nearby lake, we have a duty to save them, irrespective of any prior connection between us. But it is not clear why intensive needs short-falls in many parts of the world do not generate the same demanding duties simply because the short-falls are systemic and have become normalized. While intensive poverty might be common in parts of Sub-Saharan Africa, after all, each individual case of someone who dies of poverty-

related causes remains a tragic instance of a preventable death. The other issue for those who wish to deny the existence of positive duties to the global poor is to establish a compelling enough reason against furthering the needs of the global poor when we have a choice over what to do with our resources. While many appeal to the specialized role of the corporation as an economic efficiency-enhancing entity within societies, why corporate managers should attach more moral weight to fulfilling this function in, say, a well-functioning developed state than to furthering the basic needs of the global poor is far from obvious. Giving a coherent theory of the role responsibilities that agents have, after all, is not sufficient to show that they should always play that role even when the opportunity cost of doing so is high as it is in an unequal world like our own.

## Corporations and the Division of the Advantages of Social Cooperation

Nuno Ornelas Martins

## Introduction

The modern corporation stands in a peculiar situation, which springs from the fact that it transgresses the usual dichotomies through which the modern economic world is typically interpreted, such as that between public and private (Ciepley 2013). The capital of a corporation can be spread through private shareholders, which seems to place it in the private sphere. But the corporation also influences public life significantly and in particular what John Rawls saw as the division of the advantages of social cooperation. In this sense, corporations fulfill the criterion for becoming what Rawls saw as the major institutions that shape the basic structure of society. In fact, given the intricate relationship between rights and obligations that characterize the scheme of human relations under modern corporations, which is the central economic unit of global capitalism, the corporation can be more adequately conceived of as a commons (Deakin 2012) where the existing scheme of rights and obligations leads to a given division of the advantages of social cooperation (Lawson 2012). This stands in contrast to a contractarian approach where the scheme of human relations is conceived of in terms of a contract between individuals, akin to what takes place in market exchange.

## Markets and Commons

Market exchange has been regarded as a fundamental activity for subjective preferences to be revealed in prices, drawing upon Paul Samuelson's (1947) revealed preference theory. For this reason, the market is regarded as the key organizing mechanism in economics, and influential analyses have explained the emergence of firms through a study of their contribution to the reduction of the costs of using the price mechanism, that is, via transaction costs in markets (Coase 1937). Given the centrality of revealed preferences when studying human well-being, economic analysis of the environment (whenever we do not have market exchange of private goods so that human preferences can be expressed) engages in valuation exercises that try to overcome the absence of markets, through other means of finding revealed preference aimed at replicating market prices (Pearce 2002).

While the market has typically been seen as the key coordinating mechanism of economic activity within global capitalism, it would be difficult to understand the various organizations operating in global capitalism drawing solely on the idea of market exchange. Market exchange presupposes absolute rights of use, fruition, and disposal of various resources. The market logic stands in contrast to the logic behind a commons (Ostrom 1990, 2005). In the commons, individuals in a community have certain rights of access, withdrawal, management, exclusion, and possibly alienation (Ostrom 1990, 2005). That is, individuals can access the commons, take resources from it, exclude others, and possibly alienate those rights by transferring them to another individual. But none of these rights is absolute, and these rights exist within a form of organization that relies on certain design principles that enable a sustainable use of the commons.

The notion of the commons has been used essentially when considering the sustainable management of natural resources. It may seem somewhat utopian to argue for a replacement of the market logic with the commons' logic within global capitalism. However, the logic of the commons is already present within global capitalism.

This is so because the rights and obligations connected to the use, fruition, and disposal of various resources in global capitalism are in reality more akin to the case of a commons, rather than to a case where absolute rights of use, fruition, and disposal exist, as in a market logic.

This springs from various central aspects of global capitalism, such as the status of the corporation as a legal person (which means that neither the shareholders nor any stakeholder possesses absolute rights over the assets of the corporation), the collective nature of many capabilities within an industry (which depends on collective knowledge spread across various private companies, universities, and public entities), and the fact that the world's ecosystems provide various services that can scarcely fit within a market logic, despite many attempts to subject them to a subjective valuation that mimics the market mechanism.

Thus, the need to focus on the logic of a commons rather than on the market logic is not radically at odds with the nature of the capitalist process. It is not so much a matter of switching to an entirely different logic, but rather of achieving a more balanced configuration of rights and obligations concerning the use and fruition of common resources. One thing the financial crisis has shown, with the enormous amounts of money used to bail out corporations, is that global capitalism does not function through a market logic, but rather through a logic where common resources are used according to political and institutional power and influence (Lawson 2012; Martins 2018a, b). So seeing global capitalism through a purely market logic is essentially an illusory procedure, which is inappropriate for analyzing corporations and industries within global capitalism.

## Corporations and Commons

The idea of a commons is typically associated with the organizational setting of the Middle Ages. In medieval feudalism, rights over the land were divided into the lord's dominium directum and the serf's dominium utile. The power of the lord over the land was not an

absolute power, but only the power to demand various forms of rent and services from the serf. The serf, however, had the right to cultivate the land, and the lord did not have a discretionary power for evicting the serf from the land. In addition to the lord's lands, the serf typically had the right to work on common lands and use it for various purposes. But neither the serf nor the lord had an absolute and discretionary right over any lands, common, or other.

This stands in contrast to Roman law from the classical period when there was an absolute right over property (*plena in re potestas*), expressed in the right of use, fruition, and disposal (*ius utendi, ius fruendi, ius abutendi*). The medieval scheme was abolished after the 1789 French Revolution, which led again to the institution of absolute property rights, so that those who work the land are no longer subject to various obligations toward the feudal lord. For this to be so, those who work the land must have absolute property rights, rather than being subject to various obligations to feudal lords.

The French Revolution led to the emergence of a liberal political philosophy based on the idea of a social contract between individuals, who presumably would all be property owners. This contractarian ideal is still influential in contributions such as the political philosophy of John Rawls (1971). And it blends in well with neoclassical economics, with its emphasis on market exchange between individuals who contract with each other across several transactions and in a context where even corporations can be seen as the result of contracts, as in principal-agent contractual theory.

But, in global capitalism, social relations can scarcely be conceived of in the contractarian terms presupposed in a market logic. As Alfred Chandler (1977) explained, a central characteristic of modern capitalism is the emergence of a managerial hierarchy which is trained to engage in administrative coordination, enabling the continuing activity of multiunit firms, and which lives beyond the individuals who occupy specific positions in the firm's hierarchy. Relations of status inevitably emerge between individuals in a corporation hierarchy (Searle 2010; Lawson 2012,

2015; Martins 2018a), in contrast with what is presupposed in the contractarian approach inspired in the French Revolution, which was aimed at replacing status with free contract.

In fact, status and power are pervasive in human societies. As the social ontologies developed by John Searle (2010) and Tony Lawson (2012) highlight, the regularities of many collective practices lead to expectations as to their continuity, so that human coordination can take place. Once it is expected that certain collective practices *should* be continued, rights and obligations emerge, attached to the status (Searle 2010) or social position (Lawson 2012) of the individuals engaged in those collective practices.

In this context, Lawson (2012) developed a social ontology in which human communities are best conceived of as *organizations in process*, in which individuals slot into social positions attached to rights and obligations. This leads, in turn, to a given distribution of power in an organization depending on the specific rights and obligations attached to social positions (Lawson 2012) and status (Searle 2010). Even market exchange presupposes rights and obligations associated with the social position or status of buyer and seller. But in the corporate hierarchies of global capitalism, the role of status and power becomes clearer. Human organizations can, at best, try to achieve a more equitable distribution of status and power, rather than simply abolishing status and power altogether, as the French revolutionaries attempted to, quickly leading to a reign of terror through which status and power was reestablished with a different configuration vis-à-vis the one that prevailed in the ancien régime.

The rise to prominence of modern corporations raises important questions concerning the nature of rights and obligations and the possibility of explaining social relations in terms of a social contract. As Simon Deakin (2012) noted, modern corporations cannot be seen as a nexus of contracts between individuals for several reasons. A very important one is that corporations have a legal personality, which is a legal mechanism that provides stability and continuity to the activities of the corporation (Deakin 2012: 353–354). For

this reason, the assets of the corporation are owned by the corporation (as a legal person), rather than by the shareholders. Moreover, company law views directors as agents of the company (as a legal person) rather than of the shareholders, as in principal-agent contractual theory (Deakin 2012: 360). The fact that the corporation is regulated by multiple legislations, such as insolvency law, employment law, tort law, competition law, tax law, and the law of the corporation as a legal person, among others, means also that there is no single legal vision of the rights and obligations of the corporation or of its various stakeholders (Deakin 2012: 365).

This leads to a complex situation in which no shareholder or stakeholder has absolute property rights of use, fruition, and disposal over the assets of the corporation. Rather, employees will have certain rights of use over the assets of the corporation, according to employment law and the internal regulations of the corporations, while shareholders will have certain rights to receive dividends or sell their shares. The situation is more similar to the medieval case because there are no absolute property rights over the assets of the corporation, neither for the employees who use them and have a right to do so according to employment law (analogously to the medieval peasant who had the right to work on the land) nor for the shareholders who simply receive dividends but who (like the medieval lord) cannot arbitrarily dispose of the assets of the corporation nor fire the worker without due regard to employment law.

Deakin (2012) argues that the corporation can be best seen as a commons, where various individuals have property rights of access, withdrawal, management, exclusion, and alienation. The last of these rights, which is simply the right to alienate all the other rights, for example, by transferring them to someone else, is not regarded as essential to a commons and can raise problems if interpreted as a right of free disposal by any single individual. But it certainly applies to the case of corporations, where shares can be sold. Deakin (2012) draws upon Elinor Ostrom's (1990, 2005) design principles for managing the commons when developing an analogous set of

principles for managing corporations. And the analogy does not stop when considering a given corporation in isolation. Rather, the coexistence of several corporations within a given industry, together with the context set by government and academia, also leads to the need of understanding industry as a whole as a commons (Pisano and Shih 2009), as we shall now argue.

## Industrial Commons

The legal mechanism through which legal personality is granted provides stability and continuity to corporations. This stability and continuity enable the routinization of transactions between units within a multiunit firm, leading to a form of economic organization where activities are internalized within the firm (Chandler 1977). It is for this reason that Chandler (1977) argued that the visible hand of management has been much more important than the invisible hand of the market in shaping modern capitalism. The administration of flows from one unit to another within a multiunit firm enables a more effective scheduling of activities and use of existing capacity, competences, and capabilities (Chandler 1977, 1990, 1992). As Chandler (1977, 1990, 1992) noted, the advantages that emerge with economies of scale and economies of scope can be obtained only if the flow of materials and services can be kept stable so as to ensure that the capabilities of the various units of multiunit firms are being as fully used as possible. Of course, doing so requires success in integrating various units and systems.

The advantages of integrating various capabilities exist not only at the level of the corporation but also at the level of the industry as a whole. The idea that it is difficult to replicate existing capabilities has led many to insist on the need to focus on core competencies (Prahalad and Hamel 1990) while outsourcing noncore activities with low value added (Pisano and Shih 2009). But this has made it difficult to achieve integration at an industry level. Pisano and Shih (2009) argued that it is not only the firm's own capabilities but also the capabilities of other companies that serve its industry that constitute what they call the

*industrial commons*. Suppliers of advanced materials, tools, production equipment, and components all contribute to the formation of the collective capabilities of the industrial commons.

These collective capabilities are seen as a commons because they are part of a collective foundation for innovation that is managed by various public and private organizations, such as the government, business, and academia (Pisano and Shih 2009). The outsourcing of activities within an industry leads to the fragmentation and disintegration of those collective capabilities, which cannot be easily recovered through a subsequent reintegration of the supply chain through market exchange and the price mechanism. In fact, supply chains integrated through market exchange and the price mechanism are often controlled by key players with greater market power, who focus on extracting value across the supply chain (forcing lower prices on suppliers and/or higher prices on customers), rather than on building collectively an industrial commons in articulation with government and academia.

Distance also plays a role, as knowledge is often tacit and disseminated informally through face-to-face interactions (and transferred to other companies only when individuals who possess such knowledge switch to other companies), which means that innovation is generated in territorial contexts where an industrial commons is strong and where the government plays a role in articulating political intervention aimed at fostering the collective capabilities of the local industrial commons. Furthermore, innovation often springs from unexpected outcomes achieved through those collective capabilities, and it may well happen that key innovations come from a capability that was already outsourced and can no longer be replicated.

The analysis of Pisano and Shih (2009), when advancing the idea of an industrial commons, is centered on the American case and is concerned essentially with restoring American competitiveness, as the title of their article shows. But the idea of an industrial commons can be applied at a global level too, within a global industrial policy.

In any case, the idea of an industrial commons certainly highlights again the interconnected nature of technological development at the industry level. It is not just the corporation that can be best seen as a commons but also the industry in which corporations operate, which includes also public entities and academia. This means again that the logic underlying the management of a commons appears at different levels when studying capitalism, such as the level of the corporation and the level of the industry including the role of business, academia, and government.

## Concluding Remarks

Once we recognize that global capitalism is actually more akin to a global commons in which various other commons are embedded (e.g., at an industry level or at the corporation level) rather than to a global market in which various markets are embedded, it becomes easier to understand how organizations can meet the contemporary economic, social, and environmental challenges, through a reconfiguration of rights and obligations concerning the use of the commons. Since the communal nature of the problems facing global capitalism appears so clearly when addressing environmental problems, those who insist on a market logic have a tendency to react overwhelmingly negatively to any discussion aimed at a reconfiguration of rights and obligations connected to environmental problems. In fact, public and private entities connected to the scientific analysis and practical monitoring of environmental problems are sometimes perceived by key agents of global capitalism as intruders into the purely contractual market logic according to which the economic, social, and political world should function.

The truth, however, is that global capitalism does not function according to a market logic where isolated individuals engage in contracts, but rather according to the logic closer to that usually connected to a commons. As John Searle (2010) notes, the very use of language already

presupposes a deontology of rights and obligations, so the idea of isolated and self-sufficient individuals who must decide on a social contract before rights and obligations arise is a merely fictional device. The division of the advantages of social cooperation can benefit from a perspective where the starting point is a community concerned with establishing a sustainable balance of rights and obligations for organizing the commons, rather than a set of isolated and self-sufficient individuals who must reach a social contract on how to divide the advantages of any possible social cooperation.

## Definition

The corporation as a moral entity refers to the idea that corporations in themselves are moral agents and can be ascribed moral blame or praise, at a distinct level from their constitutive members. The discussion in business ethics is part of the larger individualist-collectivist debate over the moral status of collectives, bearing multidisciplinary implications, from an ontological debate within

theoretical philosophy to liability discourse in the legal field, as well as an economic and political debate. It refers not only to whether corporations are moral agents in a given situation, but rather to a more fundamental issue, concerning whether corporations are capable of being and acting as moral agents. With no decisive argument for or against corporate capacity to display moral agency, the issue is still under debate today, as scholars invoke various criteria which could determine what possessing moral agency requires. Depending on the answer to this question, moral responsibility may be ascribed to corporations *per se* or not.

## Description

Several lines of arguments may be delineated on each side assessing whether moral agency should only be ascribed to the individual members of corporations or corporations *per se* could be an adequate recipient of moral blame. As arguments for or against corporate moral agency in general mirror one another, we present them in the form of argument-counterargument.

## Ontological Status of Corporations

One line of argumentation starts by analyzing the status of corporations and ends up holding that this status is either fitted or not for moral agency ascriptions. On the one hand, proponents of ontological individualism argue that we lack the metaphysical support for considering corporations as agents who are able to act. The actions of the corporation are nothing more than the actions of individual members, rendering the concept of corporate morality null and void: while individuals are real, the corporation as such does not exist, it is nothing more than the sum of individuals composing it (Velasquez 2003), and it is merely an abstract collective noun or even a fiction or metaphor, simply a way of speaking. In reply, ontological collectivism advances a form of realism toward corporations (French 1984), arguing that corporations display discontinuous mentalities from their members, with their own will, which determines that a new entity emerges, one that has

a real-life force or conscience (List and Pettit 2011).

## Methodological Reducibility of Corporate Action

In order to bring arguments for or against corporate moral agency, business ethics scholars discuss the possibility of reducing corporate agency to individual agency. Proponents of methodological individualism hold that the corporate agent does not have any “additional share of moral responsibility that is distinct from the responsibility that can accrue to each of its members” (Velasquez 2003: 531) and corporations are nothing more than the sum of their constituting members (McMahon 1995). In turn, methodological collectivists argue that corporate responsibility may not always be reduced to individual responsibility. According to the “unredistributability thesis,” corporate action “cannot be re-described in terms of the actions of constituents” (Werhane 1985: 56), because the whole is more than the sum of the parts and there is a kind of corporate morality that cannot merely be traced back to individual morality (Kaptein and Wempe 2002).

## Satisfying Conditions for Moral Agency

Another strategy to address the issue of corporate moral agency is to start from those conditions that an individual human agent must meet in order to be ascribed moral agency in the Aristotelian tradition and then inquire if corporations are also able to meet them. Such conditions refer to an agent’s ability to cause an action based on his own will or intentions, while knowing the contextual circumstances of his actions and being able to deliberate on the means to achieve it.

For individualists, corporations do not meet such conditions for moral agency: individuals are the only ones capable of having a causal contribution, as it is them and not the corporation who possess the ability to act (Velasquez 2003). In the same vein, it is only individuals who are capable of (moral) intentional action, as they are the only ones capable of translating mental states into physical bodily movements – it is the individual members who act intentionally on behalf of organizations. Moreover, corporations are the creation

of individual members who designed them with a specific purpose, which corporations cannot control or change.

Instead, collectivists argue that we can find enough similarities with natural persons in order to consider corporations as moral agents: they are capable of causal contribution and are able to act and display intentionality with moral connotation due to CORPORATE INTERNAL DECISION structures (French 1984), as corporate intentionality can differ from individual intentionality or interest, for example, when individuals are fired because of poor performance. Likewise, corporations display cognitive and moral attributes by analogy to persons (Goodpaster and Matthews 1982), such as rationality, perceptions, and coordination. What is more, corporations have enough mechanisms in place in order to both gather enough information to evaluate available options and possess the necessary knowledge over the consequences of specific corporate actions. Corporations possess the necessary control to be ascribed moral agency, as they are able to control both corporate acts and the structure of policies and rules generating these acts (Donaldson 1982).

### Secondary Moral Agency

As one of the essential points of the individualist-collectivist debate concerns whether corporations are able to act in view of them being moral agents, the status of corporations as secondary moral agents is another line of arguments put forward by business ethics scholars. On the one hand, individualist arguments hold that while individuals are primary (moral) agents, corporations are only secondary (moral) agents, which diminishes or even erases their autonomy and hence their moral agency. On the contrary, scholars of a collectivist stance argue that although corporations display a second order autonomy, they can nonetheless bear moral responsibility based on their status of secondary moral agents: a corporation can act secondarily, and this action can be judged in moral terms. As Werhane (1985) puts it, such a view combines *ontological individualism* (corporations are not real persons; they exist only in virtue of their individual members) with *methodological collectivism* (corporations are

more than the mere sum of individual members, and their actions are not completely reducible to actions of constituting members) to hold that corporations may be ascribed moral agency.

### Corporate Practices as Defining Moral Agency

But is it indeed necessary to make corporate morality dependent on the concept of action, be it secondary? In order to conceive a corporation as a moral subject, the framework within which action occurs plays an even more important role. Corporations are characterized by a specific structure, and this is given by what Kaptein and Wempe (2002: 146–149) call *corporate practices* and which “include the tasks, responsibilities and procedures, relationships, norms and values, etc. that are *actually* expressed in the actions of organizational members.” Corporate practices are formed by two types of organizational structuring mechanisms: the corporate structure or formal dimension and the corporate culture or informal dimension. Both of them generate the *context* in which individual action takes place and thus influence individual morality. These corporate practices can be subjected to moral evaluation independent from individuals, for otherwise they will continue despite punishing individual members (Werhane 1985). As such, the corporate practices form the basis on which corporations can be regarded as moral entities.

### Consequences of Ascribing Moral Agency to Corporations

Accepting or denying that corporations may be moral entities has direct practical consequences in terms of attributions of blame and punishment. Here, too, arguments fall along the individualist-collectivist debate. On the one hand, accepting corporations into the moral sphere is taken by individualists to mean that the innocent may be punished together with, or instead of, the guilty, as they interpret corporate blame to be (blindly) redistributed among corporate members. In turn, collectivists argue that corporate moral responsibility is yet a different level of responsibility, meaning that it cannot be traced back to individuals, for there are situations when corporate wrongdoing does not also involve personal fault

and only corporations are fitted candidates for moral responsibility ascriptions. If we deny moral agency to corporations, we end up with voids of moral responsibility, unable to place moral responsibility either at individual or corporate level in practical situations.

On the other hand, individualist arguments hold that, if we consider the corporation to be morally responsible for a specific outcome, we might lose sight of individuals who took part in bringing about that outcome, as corporate responsibility is taken to dilute or completely eliminate individual responsibility, letting individuals to get away with wrongdoing. In reply, collectivists argue that corporate responsibility does not exclude individual responsibility and may be ascribed along with it (Isaacs 2011).

## Summary

The debate around corporations as moral entities is still ongoing, with point-counterpoint arguments advanced by each side, and there is skepticism concerning whether it may be decisively settled. In this context, scholars highlight that the effort of accepting or denying corporations as moral entities has been based on moral criteria of an individualistic nature, but such criteria are at least partly inadequate when transferred at corporate level. Therefore, one suggestion for the future of the debate is to develop argumentative strategies that take into account the specific corporate status and evaluate what a judgment concerning a corporate agent means for the corporation itself, instead of what it means for individual members, and then translate the conclusions at collective level. Beyond its theoretical relevance, the dispute concerning the corporation as an independent social entity has direct practical implications in business ethics for the way we conceive of and ascribe both retrospective and prospective moral responsibility to corporations, namely, both in terms of blameworthiness and punishment for the effects of past actions and in terms of duties and obligations for future actions, a point where it becomes connected to the concept of social responsibility.

## Correcting the Published Literature

## Definition

Disciplinary knowledge is disseminated through a published body of research. Most often, that research has been peer-reviewed prior to

publication by expert peers and prepared for dissemination by professional editorial staff and publishers. It is assumed by readers that the information in a scholarly article is accurate and has been vetted by other researchers in the discipline. When errors, either intentional or unintentional, occur, the work must be corrected to maintain credibility. The primary mechanism for correcting published scientific work is a published statement in the journal, permanently linked to the erroneous article, that sets the record straight.

## What Are the Issues?

Scientific inquiry is based on the idea that new discoveries resulting from ethical, robust research will update past findings, thus self-correcting what is known in each discipline. There are myriad examples of the development and refinement of theories, practices, and materials as well as a corpus of theoretical papers to support this claim about the sociology of knowledge (Merton 1945). A competing view by Ioannidis (2012) argues that self-correction is not guaranteed but dependent on historical, disciplinary, and societal forces that impact replication of findings. In the current environment of scholarly research, replication studies may not be funded, advance one's career, or find a suitable publisher. Incorrect or fabricated original research findings might stand unchallenged and perpetuate dangerous traditions, for example, the fabricated data published by Andrew Wakefield linking the measles vaccine to increased incidence of autism in children (Immunization Action Coalition: <https://www.immunize.org/bmj-deer-mmr-wakefield/>). Publishers, researchers, and librarians have agreed on formal procedures to correct published literature using mechanisms of published errata, corrigenda, expressions of concern, and retractions. Informal mechanisms to draw reader attention to potentially problematic research include postpublication peer review (<https://blog.fl1000.com/2014/07/08/what-is-post-publication-peer-review/>) by publisher invitation, letters to the editor published in some journals, and anonymous or attributed commentary on blogs or other third-party sites such as Publons ([www.publons.com](http://www.publons.com)).

COPE (Committee on Publication Ethics), a registered UK Charity, has developed procedures for the formal aspects of correcting the literature, which have been widely adopted by the scholarly community. Crossref ([www.crossref.org](http://www.crossref.org)), also a not-for-profit membership organization, provides the infrastructure for linking digital research outputs so that corrections are permanently linked to the original article. The following sections provide more detail on the types of corrections commonly used and their significance.

*Errata and Corrigenda:* Technical and unintentional errors that have no impact on the conclusion of a study only require an erratum or a corrigendum. Examples of technical errors requiring an erratum include misspellings of important words (particularly drug names) in the text or byline, incorrect affiliations of authors or institutions, misalignment of tables or distortions of figures in the layout of the article, missing or incorrect references or citations, or anything that could be considered a minor error or omission. A corrigendum usually implies a more significant correction such as errors in calculations in the results or on tables, failure to disclose potentially important competing interests on the part of authors or reviewers that might influence a reader's understanding of the findings, or cases of disputed authorship following publication. The corrigendum could also be as significant as a partial retraction of a paragraph or a table that does not change the results of the study. Although publishers may distinguish between errors due to author mistakes (corrigendum) and publisher errors (erratum), the National Library of Medicine (NLM) does not make that distinction: "Corrections, corrigenda, addenda, and partial retractions (such as for a single graph, statement, table, or image) for previously published articles are all uniformly considered by NLM to be errata" (<https://www.nlm.nih.gov/bsd/policy/errata.html>).

A well-written correction should include the full citation to the article being corrected, a statement about what is being corrected, the page or electronic location where the error can be found, the full correction, and be published on a numbered page (or clearly identified in the table of contents of online-only publications) of the journal that published the original article. It is not

possible for a journal to issue a correction to an article it had not originally published. The correction is permanently, electronically linked to the original article and should be cited as a part of the complete reference in subsequent use by other researchers. It is subsequent researchers' responsibility to check for corrections to articles they use as supporting background for their new work before submitting their own publications.

*Retractions:* A retraction is reserved for "seriously flawed or erroneous content or data" and can be issued in cases of data falsification, fabrication, plagiarism, research misconduct, copyright infringement, unethical research, or significant, albeit unintentional, error (COPE Council 2019). Recent findings of peer review manipulation have also created rationale for retracting papers even if the authors did not participate in the peer review manipulation; investigations have reported third-party agencies (<https://publicationethics.org/news/cope-statement-inappropriate-manipulation-peer-review-processes>), editors, peer reviewers, as well as authors ([https://publicationethics.org/files/COPE%20PR\\_Manipulation\\_Process.pdf](https://publicationethics.org/files/COPE%20PR_Manipulation_Process.pdf)) have been implicated in various schemes of unethical conduct of peer review. Retractions can be authored by editors, publishers, or the authors themselves; although it is preferable that everyone agree the retraction, it is not a legal requirement.

The purpose of retractions is to correct the literature and alert readers to unreliable evidence and thus maintain the integrity of the scholarly record. The reasons for the retraction must be clearly articulated in the retraction notice so readers understand why the article cannot be trusted. Retraction of an article should not be seen as punishment of an author. In cases of redundant or duplicate publication where the findings are not in dispute, the original article can be marked with a notice of redundant or duplicate publication (<https://www.nlm.nih.gov/bsd/policy/errata.html>) and should not be retracted; however, any duplicate article published after (by date) the original should be retracted by the publisher. This avoids the tendency to punish authors for duplicate submissions when the science is sound, but the authors engage in unethical behavior in dissemination practices. Duplication of a published

article by anyone other than the original authors is treated as plagiarism or copyright infringement and must be retracted. Occasionally, a translated article might be published in a second journal, but acknowledgment of the original article and permission to publish the translation from the original copyright holder adequately covers this duplication. Other requirements for a comprehensive notice of retraction include: clear identification of the article being retracted, clear identification as a retraction rather than another type of correction, reasons for the retraction, identification of who is retracting (i.e., author, editor, publisher), and written in objective, factual, non-inflammatory language (COPE Council 2019). Publication should be prompt and clearly linked to the original article, and the notice should be freely available to all (i.e., not behind a paywall). The NLM also requires the notice to be published on a numbered page and listed in the table of contents as a retraction notice (<https://www.nlm.nih.gov/bsd/policy/errata.html>).

The decision to retract an article is not made lightly. Editors and publishers have a responsibility to their readers, but also to their authors, to make an informed decision based on evidence. This is sometimes a difficult process. Research takes place outside the publishing world in institutions of higher learning and specialized research institutes. The responsibility for the ethical conduct of that research rests within those institutions, which means the investigation of any misconduct lies with the administration of those academic and research centers. Editors do not have jurisdiction over the researchers, their work, or their laboratories; thus, they must rely on the institutions to investigate allegations of misconduct. Institutions may be slow to respond for many reasons: lack of research integrity officers or anyone designated to oversee research ethics at the institution, conflict of interest between supporting their own researchers and responding to editors' requests for investigation, lack of experience or knowledge about research oversight, and budget restrictions. Therefore, although problems with a paper are recognized by readers, editors, and publishers, it may be some time before any formal investigation is conducted and concluded. Editors may be unwilling to act without clear evidence and

dubious papers could remain in the literature without any notice while an investigation languishes. The outcome of this malaise is that many flawed articles continue to drive research and practice both before and after investigations and retraction (<http://retractionwatch.com/the-retraction-watch-leaderboard/top-10-most-highly-cited-retracted-papers/>). To avoid this dilemma, editors can issue an Expression of Concern clearly stating that the validity of the findings are under investigation and readers should not rely solely on this work. Expressions of Concern are a specific NLM article category (<https://www.nlm.nih.gov/bsd/policy/errata.html>) and are linked to the article in the same ways as actual corrections and retractions.

*Informal Corrections:* Although not a specific named entity in the NLM, comments, letters to the editor, and author responses to comments are all mechanisms for challenging, refuting, supporting, or clarifying a published article and can be permanently linked to the original article. These enhancements are linked as Comment and Author Reply (<https://www.nlm.nih.gov/bsd/policy/errata.html>) and can be retrieved with the original article with most search engines. Other informal commenting mechanisms such as Publons are not linked to the retrieved article but easily accessible by entering searchable terms such as the article DOI, PMID, author name, etc., on the Publons website (<https://publons.com/search/>).

## Author and Researcher Responsibilities

Authors and researchers must understand the significance of any correction to an article they cite to support their work. Those who are also educators must assume the responsibility of teaching students to critically read the literature, including deliberate discussion of the self-correcting nature of their discipline. The International Committee of Medical Journal Editors (ICMJE) has clear expectations for authors submitting to the journals of their members. Authors are expected to avoid citing unreliable literature, such as articles in predatory (pseudo) journals, and superfluous citations that enhance their own or colleagues' work and reputation. Original citations are preferred over reviews, unless the review is a systematic one. Finally, "[a]uthors are

responsible for checking that none of the references cite retracted articles except in the context of referring to the retraction" (<http://www.icmje.org/recommendations/browse/manuscript-preparation/preparing-for-submission.html#g>). These are all reasonable steps to preserve the integrity of the scientific literature and an ethical way to proceed for any student, author, researcher, or reviewer.

## Introduction

Corruption and gender have tended to inhabit separate universes in research and policy-making, but there is an increasing focus in the international

community and among researchers on the link between these two concepts. Many have argued that it is not possible to effectively address corruption without addressing gender inequality, and similarly, the goal of gender equality is impeded by corruption.

In 2011, United Nations agencies called for a gendering of discussions on corruption leading up to the Conference for the *United Nations Convention against Corruption* (UNCAC). Although the UNCAC does not directly refer to gender, it is seen to be an important lens for understanding and combatting corruption. The UNDP suggests that it is important to examine gender and corruption in order to determine if anti-corruption interventions help or hinder women's empowerment and whether actions on women's empowerment help advance the anti-corruption agenda. Using gender as an analytical lens provides insights into corruption, its mechanisms, and its impact, thus allowing for an increased understanding of the ways in which corruption affects society as a whole and the strategies required to combat it. In addition to state governments and organizations such as the OECD which link gender and corruption, some nongovernmental organizations (NGOs) have also done so, including Transparency International (TI) and the International Association of Women Judges.

Although corruption has traditionally been seen as a problem of the public sector and governments, there is increasing recognition of the role of business as victims or perpetrators of corruption in a variety of UNCAC articles, such as the *Bribery of national and foreign public officials* (Articles 15 and 16), *Bribery in the private sector* (Article 21), and *Laundering of proceeds of crime* (Article 23). In response, organizations such as the UN Global Compact, the UN Women's Empowerment Principles, and the Pan African Chambers of Commerce and Industry have begun to explore the links between the two concepts.

### Similarities Between the two Concepts

There are many similarities between the concepts of gender and corruption, both of which are

socially constructed. While their definitions vary and are much debated, there is broad consensus that both gender inequality and corruption involve the exercise and/or the absence of power, involve the control and/or lack of control over resources, have been significantly affected by globalization, and are seen to undermine human development. Gender inequality and corruption have been targeted by numerous laws and international conventions over the past number of decades, and efforts to address these have recently been integrated into corporate social responsibility initiatives, due to increased attention by non-state actors such as businesses and civil society organizations. The promotion of gender equality and the reduction of corruption are both viewed as means to an end (the end being sustainable development) and as ends in themselves; both are the focus of stand-alone Sustainable Development Goals (SDGs 5 and 16). Increased interest in both gender and corruption has spawned an industry of consultants and advisors to businesses and governments, at the same time stimulating academic research on both concepts alone and as they relate to each other.

### Are Women or Men More Corrupt?

Much of the academic literature on gender and corruption focusses on whether gender is an important predictor of corrupt behavior. For example, researchers examine the differences in corruption activities among business owners, politicians, the judiciary, students, managers, employees, and private citizens and consumers. Differences based on gender have been observed in a variety of contexts. While some research has found that women are less corrupt than men (in specific contexts and in laboratory experiments), other research has found that there are few differences between men and women in terms of their corruption-related behaviors.

Rather than there being innate gender differences concerning corruption, any observed differences by gender are seen to be rooted in the cultural, organizational, and political contexts (Essary and Charillo 2013). Factors such as socialization and access to or exclusion from

networks are used to explain gender-based differences in corruption attitudes and behaviors. For example, research has found that the way girls and women are socialized makes them less likely to engage in risky behaviors such as offering bribes. In addition, given women are expected to focus on the family and caring functions, they may have less inclination to participate in corruption which could result in harm to others, including their families.

In addition to observed gender-based differences in corruption (attitudes and behaviors), women are often perceived as being less likely to be corrupt than men, which can have the effect of reducing concerns about corruption when women are in power. It has been suggested that this perception is rooted in stereotypes that women are more reticent to take risks and are more honest than men (Barnes et al. 2018).

Women throughout the world have less opportunity to engage in corruption. For example, women tend to have less access to networks where corruption takes place. In most countries they are underrepresented in positions of power and leadership in government, business, and public sector institutions such as in the health and education sectors.

### Using Women as Tools to Combat Corruption

The research suggesting women are less likely than men to engage in corruption has led some to conclude that women are inherently less corrupt than men, prompting policy-makers to ask if increasing the proportion of women in leadership roles in government would help to reduce the amount of corruption. Thus, some anti-corruption strategies have developed initiatives to get more women elected in governments and into positions of leadership in the public and private sectors, using women as tools to combat corruption. This strategy is predicated on the idea that women are inherently less corrupt and less susceptible to corruption.

The notion of mainstreaming gender to combat corruption has been criticized for being limited

and simplistic and for failing to recognize the underlying gender dynamics at play in society (Rothstein 2016). Having more women in government and leadership positions may in fact reduce corruption. However, this would not be due to women inherently being less corrupt than men but because, in the context of increasing gender equality, there would more active participants and voices, more open governance, the disruption of existing networks, and the creation of new, more inclusive networks. Concern has also been expressed that if women are being used as tools to combat corruption, focus may be diverted from the broader goal of gender equality, where women would have better access to networks and political power and where family care responsibilities would be better shared with men. Some warn that this approach could backfire and undermine the goal of gender equality if efforts to promote women to combat corruption fail to do so (Bérenghère et al. 2017). Attempts to more deeply understand and address both gender inequality and corruption draw attention to the gendered impacts of corruption.

### Gendered Impact of Corruption

Corruption often has a greater impact on women and reinforces gender inequality. Since corruption affects poor people disproportionately, women as a group tend to suffer more than men, as women and girls make up a majority of the world's poor. Many argue that gender inequality puts women at greater risk of being victimized by corruption directly and indirectly; they tend to have less power to resist corruption. Women often experience and perceive corruption differently than men.

Corruption is seen to distort power, which results in an uneven allocation of wealth and resources, thus exacerbating inequality. Women and girls often have less access to resources in many countries and are therefore less able to pay bribes to get basic services or access to schools, health care, and other public services. Women in many economies, especially in the Global South, tend to have less access to the financial

credit and resources required for developing and maintaining a business, even micro-sized business such as a stall in the market or a single sewing machine for a home-based business. Women in many societies do not have access to these resources and information networks. Men often have more networks, knowledge, and resources which allow them to do what it takes, often in the form of paying a bribe, to free up credit and financial resources. For women, the lack of resources has a significant effect as it presents barriers to women's economic empowerment.

As the primary caregivers of children and older generations in most societies, women have more interactions with the services vulnerable to corruption (e.g., education, health care, and legal and social services). Funds destined for development initiatives that directly and indirectly promote gender equality often do not reach their destination. Not only does this expose women to an increased risk of corruption as they try to access these services, there is a compounding effect as resources which are destined to alleviate poverty and to support health care, education, and other public services are diverted into private hands through corruption. This diversion can result in further cutbacks to public services which women rely on and can have a compounding effect on gender inequality. In the case of education, for example, barriers to the education of girls can prevent future generations from escaping poverty. Women are particularly affected by these indirect impacts of corruption which makes life more difficult for people living in poverty.

Many researchers and policy-makers ask if women are more likely to be directly victimized directly by corruption. The gender which has more interaction or responsibility in the areas in which the corruption is occurring would have a higher risk of being a victim and a greater exposure to corruption. For example, in societies in which men do most of the driving, men as a group have been found to have a higher risk of being victimized by corrupt traffic officials.

However, women can be disproportionately at risk for being victimized. For example, women as

a group are disproportionately affected in land corruption, which draws attention to the gendered nature of this practice. Women in sub-Saharan Africa often lose their access to their land upon the death of their male spouse, and corrupt officials demand money and/or sexual services as payment for the transfer of the land title (Transparency International 2014).

## **Sextortion and Women as Currency**

The direct impact of corruption can harm women, over and above the harm that corruption causes to society in general, when extortion, bribes, and sexual favors are imposed on them because of their lack of power in a given social context. Women and girls are also at increased risk of being used as the currency of corruption.

A focus on sexual violence, sex for favors, sexual exploitation, and extortion provides more insights into the gendered impact of corruption. Women are more exposed than men to the risk of sexual violence, and corruption can increase this exposure. The International Association of Women Judges has coined the phrase "sextortion" – referring to the "abuse of power in exchange for sex" or "the abuse of power to obtain a sexual benefit or advantage." Money is not the only thing that changes hands in corruption exchanges – sex can be a "currency of the bribe" (Thomson Reuters Foundation et al. 2015). Sextortion, which is a form of bribery, draws attention to corruption as an abuse of power.

When someone is forced into providing or offers a sexual favor in order to obtain something they require, it is the exchange nature of the incident which constitutes corruption – the abuse of power for private gain. Definitions of sextortion also include abuse through the collection and sharing of images online in order to extort something. In most cases, women and girls are the primary victims of this type of corruption. Gender-based power imbalances enable perpetrators to use coercion to obtain sexual favors. A demand for sex is made in exchange for some

benefit that the demander is in a position to confer. This occurs in a variety of contexts such as education, health care, border crossings, and prisons.

According to one report, over ten percent of girls in one southern African country reported that they agreed to sex to avoid punishments or sanctions, and two thirds reported having been sexually harassed by their teacher. In some countries patients are detained in hospital until they are able to pay their medical bills. There is evidence that women have been coerced into engaging in sex with medical personnel in order to pay off the bills and be allowed to return to their families. Corruption also has a significant impact on human migration. In this context, women and girls, traveling alone or with a family, are at higher risk to become victims of sextortion and other forms of corruption. The potential for sextortion and sexual abuse in addition to other forms of corruption exists for all types of migrants, but there is evidence that women refugees and those with irregular status are more affected. In 2017, the hashtag #metoo became a social media phenomenon about sextortion and sexual harassment in the context of the film and entertainment industries in the United States and has spread beyond to encompass many regions and industries.

In many countries, sextortion is distinct from other forms of corruption as there are usually no specific laws which address it. Related laws can be used to prosecute cases of sextortion, but many are never brought forward due to barriers arising from gender inequality, such as the stigma of the act itself and the punishment, shame, and exclusion from the community that some women and girls may face if the sexually coerced acts become public. Some jurisdictions, for example, California, are moving toward making sextortion illegal.

Concerns have been raised about whether or not those who are victims of sextortion may be charged with being party to a bribe where they received a benefit (e.g., access to a service to which they were entitled or a promise not to inflict harm). Some argue that the only way someone who has been extorted for sex should be held

accountable as a party to a bribe is where an offer of sexual services was made and refused.

Sometimes women are the actual commodity or reward being exchanged. It is estimated that over 80% of trafficking victims are girls and women. Although they are usually not involved as a party in the corrupt exchange, they become the victims, where corrupt officials offer them as prostitutes, slaves, or in the trade of organs and body parts. They become the currency of the corrupt exchange; a bribe paid with sex can be more difficult to trace than one paid with money.

There have been a number of cases reported in the media where representatives of companies and public sector organizations have provided prostitutes and sexual services as part of the currency of the bribe. In 2015, a senior US Navy officer plead guilty to having received such a bribe in exchange for providing classified information, and in China, officials have tried to address problems associated with the “*chi he piao du*” (“eating, drinking, whoring, and gambling”) business culture, which has been linked to corruption. Despite being victims of corruption, these women and girls are sometimes viewed as being responsible for the corruption and the harm to reputations if the corruption becomes public.

## Initiatives on Gender Inequality and Corruption

A number of nongovernmental organizations address gender inequality and corruption together. For example, the International Women’s Judges Association, to address gender inequality, works to reduce corruption within the judiciary and has called for legal reform, protection for whistleblowers, and the penalizing of sextortion as a form of corruption.

Transparency International (TI) has called for anti-corruption work and international conventions on corruption to take gender into consideration and has proposed the collection of gender-specific data, the inclusion of women in decision-making at all levels, and a focus on gender responsive budgets. TI has stressed the importance of increasing the percentage of

women working in public service areas such as education and health care, implementing gender-aware codes of conduct, and involving women in anti-corruption work, while recognizing barriers to women becoming involved in this work. The double burden of working inside and outside the home can leave little time for activism. In addition, women's lower educational levels can be a barrier to legal and civic awareness, economic marginalization can mean that many forms of corruption become a way of life, and social mores impede women's confidence in speaking out on matters such as these (Transparency International 2014).

Increasingly, attention is paid to the private sector's role in perpetuating corruption and gender inequality and in taking concrete steps to address it. International supply chains in industries such as textiles are affected by corruption. The collapse of the Rana Plaza factory in Bangladesh in 2013 which killed over 1000 people, mostly women and girls, is seen to have occurred in part due to corruption.

The UN Global Compact addresses both gender inequality and anti-corruption, and while there is not much linking the two topics explicitly within the initiative, its signatories commit to addressing both issues. Gender-specific CSR initiatives such as the UN Women's Empowerment Principles focus on the economic empowerment of women, so that women and girls have the power needed to resist certain forms of corruption and overcome in part corruption's disproportionate impact.

Governments are beginning to address gender and corruption; studies have been conducted by Sweden, Denmark, Finland, the Netherlands, and Uganda, among other countries. The OECD, World Bank, and numerous development agencies are also conducting research on the links between these two concepts. Many of these organizations integrate their work on gender and corruption as part of their broader national and international development agendas, and are integrating more of a human rights-based approach to combatting corruption, as recommended by Berenger et al. (2017) and others.

## Corruption and the American Foreign Corrupt Practices Act

### Definition of the Foreign Corrupt Practices Act

The Foreign Corrupt Practices Act (FCPA) is a U.S. federal law enacted in 1977 that prohibits certain types of payments to foreign government officials advanced by specific individuals or organizations in order to obtain or secure business contracts.

The FCPA, or Foreign Corrupt Practices Act (15 U.S.C. & 78dd-1), which came into effect in December 1977 is a landmark of US federal legislation which for many years singled out the United States as the only nation in the world to pass a law prohibiting the bribery of foreign public officials. The law was designed to prohibit payments advanced by US businesses or their agents for the purposes of securing or retaining business in foreign jurisdictions. Until 1977, all antibribery legislation in the world applied only to officials in the home nation in which the particular business enterprise was domiciled. The FCPA thus represents an extraterritorial extension of principles of a nation's foreign policy applicable to the conduct of overseas business, and thus it is highly significant both with respect to the law and to the history of globalized business. It has been regarded as a major effort to regulate the conduct of foreign business by making such business practices conform to standards of morality, standards which in the case of the United States would align its foreign policy (as set forth at the time by the

Carter administration) with the practices of US multinational corporations. Indeed, the law has been credited with redefining fundamental relationships between business and government (Greanias and Windsor 1982).

The law was very much a product of its times and its passage marked a transition in global commerce away from the restrictions of the Bretton Woods system to a more flexible, deregulated, and globalized business environment. For most of the postwar period until 1971, the need for antibribery legislation was deemed not to be pressing because of the power the Bretton Woods system granted to developing nations in terms of control over their economic, financial, and business affairs. With the disengagement from Bretton Woods which began in 1971, it became clear that the toleration of illicit payments could no longer be permitted because of their debilitating effects on democratic institutions and market functioning (i.e., misallocation of resources) in developing nations, nations that were now much more vulnerable to the power and blandishments of multinational corporations in a more globalized world.

The Watergate and other related investigations into business and political practices of US corporations in the 1970s made it clear how extensive these problems were. The Congressional hearings related to these matters led to additional inquiries conducted by the International Chamber of Commerce, the United Nations, and the OECD. While the United States was the only nation to initially set forth a law prohibiting such illicit payments, other nations followed with "soft law" provisions (e.g., codes of conduct) that remained in place until a greater coordination of legal restrictions was achieved in the late 1990s.

There has been a tendency to evaluate the effectiveness of the FCPA from both ethical and business related perspectives rather than a strictly legal perspective. From the business side, there were numerous complaints related to matters of basic business conduct. As US Senator John H. Chafee (R – Rhode Island) put it at the time: "It was not our intention to create massive confusion, consternation and uncertainty among the

business community and the accounting and legal professions. We have done both.”<sup>1</sup> Some analysts have understood the prohibition of illicit payments in terms of the social license to operate.<sup>2</sup> Moreover, the law is only infrequently subjected to judicial review. Most cases have been subject to civil settlements and/or the lodgement of a guilty plea.

An important feature of the FCPA is the joint administration of its enforcement by two US federal agencies, the Department of Justice (DOJ) and the Securities and Exchange Commission (SEC). The DOJ maintains responsibility for criminal prosecutions while the SEC investigates the law’s accounting provisions and effects civil enforcement with respect to issuers of securities in US markets. Until 2010, few cases had been prosecuted by the DOJ, with the majority of investigations conducted by the SEC through civil proceedings and the lion’s share resulting in agreed upon settlements.

Another important trend can be found in the increasing level of voluntary cooperation of corporations with federal officials, with the result that increasingly companies themselves are providing notification of potential FCPA violations with the objective of reducing the penalties they would otherwise face. An investigation into WalMart which started in 2011 illustrates this trend. It began with the company’s self-reporting of problems in Mexico, but the investigation then spread to India and China. (At the time of writing, Walmart is facing potential FCPA penalties totalling \$600 million.) A September 2015 memo written by the Deputy Attorney General Sally Yates gave strong impetus to self-reporting, which in April 2016 resulted in an FCPA pilot program that assessed companies for the timeliness of initial reporting, the strength of internal control mechanisms resulting in self-detection, and the subsequent levels of cooperation provided to investigators.

These trends point to the FCPA’s increasing effectiveness, reflecting considerable

improvement over results achieved in the early years of the law’s existence.

## A Brief History of the FCPA

Investigations by Watergate’s special prosecutor revealed a multiplicity of illegal corporate campaign contributions to President Nixon’s re-election committee, most of which involved payments not properly disclosed. This in turn prompted the SEC to investigate all politically oriented payments by corporations, including those made to foreign officials and/or involving secret accounts or false records. In 1974, the SEC launched a voluntary disclosure program, which eventually elicited reports from over 400 US corporations. Among the high profile disclosures were ITT corporation with respect to its operations in Chile, Exxon with regard to its Italian subsidiary, and Gulf Oil’s Bahamian slush fund, which routed illegal campaign contributions to US politicians. Most significant of all was Lockheed, which had received loan and credit accommodations from the US federal government and was embroiled in bribery scandals in Japan, West Germany, Italy, and Holland. Other SEC and Congressional committee investigations followed, resulting in a general determination that the practice of illicit payments was widespread.

A number of these cases were investigated and prosecuted by the SEC. There was, however, clear dissatisfaction with the state of the law and the capacity of regulators to investigate and prosecute US corporations engaged in the bribery of foreign public officials. As a result, the Congress began a search on ethical and prudential grounds for a legislative remedy. The United States already had numerous prohibitions against bribery and corruption embedded in existing federal laws, but there was nothing explicitly prohibiting payments to foreign officials.

Several proposed versions of legislation were drafted, many of which stipulated disclosure of irregular payments rather than an outright ban. Assistance was forthcoming from other quarters. The United Nations General Assembly passed a resolution titled “Measures Against Corrupt

<sup>1</sup>“Letters to the Editor,” *Wall Street Journal* (May 13, 1981)

<sup>2</sup>Greanias and Windsor, *op cit.*, 36

Practices of Transnational and Other Corporations” (United Nations General Assembly 1975). The OECD adopted voluntary guidelines for its member states.<sup>3</sup> Within the US Congress there was a growing demand for an outright ban, rather than simply disclosure of corrupt payments to foreign public officials. This demand was solidified with the election of Jimmy Carter as President, and with his inauguration came the impetus for improving the ethical standards of US corporations operating internationally, along with new foreign policy initiatives designed to encourage the political allies of the United States to live up to higher standards of human rights and political integrity. The Foreign Corrupt Practices Act was signed into law in December 1977.<sup>4</sup>

The law came into effect at a time of great difficulty and instability for the United States with respect to its foreign policy and worldwide business dealings. The US dollar was being subjected to considerable downward pressure in a post-Bretton Woods world which was becoming accommodated to floating exchange rates. Oil prices had quadrupled earlier in the decade and were about to rise sharply again, creating enormous pressure on the economies of non-oil exporting developing nations. The United States itself was incurring significant trade deficits, and the composition of American exports was changing markedly. All these factors created major uncertainties for US companies doing business overseas as they faced imperatives for complying

with antibribery legislation that did not apply to corporations domiciled in other nations. There were concerns that US companies would lose business to foreign competitors in a world that was commencing a process of rapid globalization. Concerns about the law itself centered on issues of extraterritoriality and the capacity for enforcement, as well as the lack of distinction between “bribery by” as opposed to “extortion of” American companies (i.e., the distinction between the supply side and demand side). There were also concerns that the companies were now being harnessed to US foreign policy objectives in such a way that what was good for the United States was also deemed to be good for its corporations.

An enormous sea change took place under the Reagan administration, which came to power in early 1981. The strength of the US dollar was restored globally as a result of policies put into place by Paul Volcker as chairman of the US Federal Reserve during the Carter administration. These anti-inflation policies of high interest rates began to bear fruit under Reagan, and the United States increased its power and prominence even as numerous developing nations were decimated by the global banking crisis of 1981. The foreign policy priorities of the US government shifted away from human rights and high business standards toward prescriptions that would come to be known as the “Washington Consensus” by the end of the 1980s. Foreign governments allied with the United States, especially those hard hit by the 1981 crisis, were now required to open their economies to foreign trade, cut business subsidies to domestic industries, and reduce social programs. US corporations, on the other hand, gained the benefits of increasing deregulation as well as a freer hand in their foreign business dealings. This was reflected in the nature of FCPA prosecutions during the Reagan era, prosecutions that were both reduced in number and which elicited signs of bilateral policy objectives with respect to the countries affected that tended to cast doubt on whether the FCPA was being impartially enforced (Cragg and Woof 2001).

These changes were reflected in the amendments to the FCPA that were implemented in 1988 as part of the Omnibus Trade Act. It now

<sup>3</sup> OECD Guidelines for Multinational Enterprises, June 21, 1976. Of particular interest are guidelines 7–9 (page 14) which state in part that corporations should “not render – and they should not be solicited or expected to render – any bribe or any other improper benefit, direct or indirect, to any public servant or holder of public office.” <https://www.oecd.org/corporate/mne/50024800.pdf>

<sup>4</sup> The FCPA underwent two major revisions, the first in 1988, the second in 1998. The 1988 amendments were part of the Omnibus Trade and Competitiveness Act passed in the same year. The changes clarified the standards of knowledge and intent with regard to the commission of offenses under the FCPA, e.g., through third party agents. The 1998 amendments were part of the OECD Anti-Bribery Convention and expanded the FCPA’s coverage of foreign citizens and corporations

had to be proved that those offering bribes had direct knowledge of the nature of the payments, as opposed to the old “reason to know” standard. Greater emphasis was given to the legality of the payments in the country in which they had been given. The result was an increase in the number of cases investigated, although the SEC, which still pursued more cases than the DOJ, placed increasing emphasis on self-regulation as the frontline of anticorruption activities. As a result of changes to burden of proof that diminished the “reason to know” standard, corporate executives were more insulated against personal involvement and legal responsibility with greater chances that officers farther down the corporate ladder would take the blame and risk of jail time. The more politically connected industries/corporations (e.g., oil) were less vulnerable to prosecution.

Political considerations would increase in importance throughout the 1990s after the collapse of communism and the rapidly increasing prominence of global trade which followed. Treaties and trade agreements proliferated, outsourcing accelerated, NAFTA and the WTO were established. China erupted into prominence as a major center of manufacturing and trade, while financial corporations and other high profile firms like WalMart gained enormous market dominance. The resulting complex network of interests had to be carefully nurtured and promoted by the US government, but critics of globalization were quick to point out that these political considerations often promoted the very corrupt behavior in foreign business relations that the FCPA was meant to prohibit. Nobel economist Joseph Stiglitz notes that as competition among developed nation states and their corporations increased on the global stage, foreign investment in developing countries would often be encouraged through tacit approval of bribery by countries like the United States and France, and this was often evident when agreements worked to the disadvantage of developing nations (Stiglitz 2003). Not surprisingly, some countries came up with imaginative schemes to corruptly exploit developed nation programs to their own advantage. Iraq’s oil-for-food program (OFFP), for example, was designed to allow humanitarian aid to enter the country

after the first Iraq War. However, numerous Western corporations, including Chevron, Ingersoll-Rand, and AGCO, sold goods to Iraqi government ministries with the tacit understanding that such sales would not be disapproved of by the US government. Thus, when extorted by Iraqi government ministries into paying kickbacks, many of these companies complied, believing (with considerable legal justification) that payments made directly to Iraq’s government, rather than government ministers, would not be charged under the FCPA. However, many of these cases were in fact subsequently prosecuted under the FCPA.<sup>5</sup>

The intensified competition between developed nations resulted in increased US pressure for their competitors to adopt their own antibribery legislation. The result was the OECD Convention on Combating Bribery of Foreign Government Officials, which came into effect in 1997. This was followed by country specific legislation, such as Canada’s Corruption of Foreign Public Officials Act of 1999. The Convention encouraged cooperation between law enforcement agencies of signatory countries. However, collaborations were limited by legislative provisions safeguarding the national security interests of the countries concerned. In practice, this meant that corporations cooperating with the government departments or agencies were

<sup>5</sup> The Oil for Food program (OFFP) was established by the Clinton administration in the mid-1990’s to answer criticisms concerning the suffering of the Iraqi people in the wake of the first Iraq war and the economic restrictions imposed subsequently on Saddam Hussein’s regime. The United Nations was given administrative authority over the program, which led to later criticisms by U.S. Republicans and neo-conservatives against the UN once the scandal broke and the extent of the corruption became clear. After the U.S. invasion of Iraq in 2003, the OFFP was replaced by the U.S. administered Iraq reconstruction fund, which in turn was criticized for massive misallocation of spending. The U.S. was also accused of ignoring illegal oil sales by Iraq during the late 1990’s. Legal experts have noted that FCPA enforcement actions made against companies charged with illegal kickbacks were not made under the FCPA’s anti-bribery provisions for the very reason that the payments were made directly to Iraqi government ministries rather than to individual government officers. <https://www.wilmerhale.com/pages/publicationsandnewsdetail.aspx?NewsPubId=95741>

exempted from any bribery related investigations. In fact, such provisions were explicitly articulated in the FCPA itself.<sup>6</sup>

No commodity had greater value for national security interests than oil,<sup>7</sup> and this is reflected in the almost total absence of major American oil companies from prosecution under the FCPA. But this also showed up in the relationships of multinational oil corporations to oil rich developing nations that were plagued by government corruption. African nations such as Angola, Chad, and Equatorial Guinea were examples of this trend which became particularly acute in the early years of the twenty-first century. US Congressional investigations into the Riggs Bank found substantial irregular transactions involving the embassy of Equatorial Guinea in Washington that had not been reported to federal authorities. Investigators suspected irregularities in repayment of the country's foreign debts as well as funds not properly routed through its central bank and possibly used for arms purchases. ExxonMobil, which does business in all three of these countries, was subject to an inquiry by the US Justice Department (DOJ) as to whether the company had been in violation of the FCPA. Of particular concern to the DOJ was the fact that Equatorial Guinea's ruling (Obiang) family had extensive family ties and business dealings with ExxonMobil that had been exposed by the Riggs Bank investigation. The company defended itself by claiming that its investments and real estate holdings in Equatorial Guinea were not only legal under the FCPA, but also promoted high standards of corporate responsibility. It based its claim on the fact that the Obiang family's control of the country's economy is so complete that there is no market for services outside of it. Indeed, the DOJ did accept ExxonMobil's explanation and

concurred that the complete absence of arm's-length transactions or any laws respecting conflict of interest in a given nation state did not, under the provisions of the FCPA, prohibit a US corporation from doing business there. In such cases, then, political imperatives pertaining to national security trump principles where the FCPA is concerned (Coll 2012). This is particularly true in the case of Africa, since this continent became the focus of China's long-term energy investments in the early years of the twenty-first century, the result of China's rapid industrialization and its massive increases in demand for imported oil. US foreign policy experts have explicitly identified increasing competition between China and the United States over access to foreign oil reserves as a crucial national security concern for both nations.<sup>8</sup>

## Conclusions

Conclusions as to the current effectiveness of the FCPA might best be realized through a brief review of the dominant enforcement trends over the past decade. First would be the larger size of corporate penalties, along with the greater cooperation of the SEC and DOJ (often in concert with foreign governments pursuing same case

<sup>8</sup>In discussing the importance of access to oil with respect to the military capabilities of the United States and other nations, Charles L. Glaser, Director of the Institute for Security and Conflict Studies at the Elliott School for International Affairs, George Washington University notes: “A distinctive feature of this framework is that some of these mechanisms identify threats to U.S. security that flow from another country's consumption of oil, not from U.S. consumption. Of particular importance is the potential danger that China's oil imports create for U.S. security – China's efforts to protect its sea lines of communication are fueling military competition that could strain U.S. – China relations and increase the probability of conflict between them.” “How Oil Influences U.S. National Security” [http://www.mitpressjournals.org/doi/abs/10.1162/ISEC\\_a\\_00137?journalCode=isec#.WH4jOvkrLIU](http://www.mitpressjournals.org/doi/abs/10.1162/ISEC_a_00137?journalCode=isec#.WH4jOvkrLIU). *International Security* MIT Press Journals vol. 38, no. 2 (Fall 2013) 112–146. investigations) in effecting the joint investigations that very often lead to these large settlements.<sup>9</sup> Voluntary cooperation, self-reporting, and initiation of investigations by the companies themselves have also been factors for many years, well before the Yates Memo noted earlier. As a result, the DOJ has been willing to enter deferred prosecution agreements and nonprosecution agreements with companies, depending on the complexity of the case and the nature and the extent of the cooperation. One notable trend that became evident under the Obama administration has been the increase in the number of individuals prosecuted and sentenced, and there have been cases of extradition requests filed for foreign nationals. There has also been an increase in industry investigations initiated by DOJ and/or SEC, as well as company initiated disclosures that have resulted from the due diligence activities related to mergers and acquisitions, of which there have been a sizable number. Finally, there has been an increase in the number of independent monitors used, typically to provide oversight over remedial activities undertaken by companies subjected to DOJ investigations, settlements, and prosecutions. Monitors are usually appointed for a 3-year term and review remedial activity in conjunction with the company's foreign operations.

With respect to the FCPA and similar legislation, it might be reasonably concluded that the success of antibribery legislation depends upon concomitant commitments to curtailing corruption, and this can be highly problematic given the political imperatives for maintaining

dominance in global affairs or else ensuring that national security objectives are met. Governments have a responsibility for the success of their corporations both at home and abroad, but they also have more fundamental responsibilities to citizens to ensure that corruption does not undermine the fundamentals of the social contract itself.

## Definition

Social research in which scholars do not reveal their identity or the purpose of their presence in the field to the individuals whom they are observing, or with whom they are interacting, can be termed “covert.” For research to be defined covert, it is sufficient that at least one of the potential participants is unaware of the researcher’s intentions and of the real reason for his/her presence in the field. The concealment of the researcher’s identity can in fact be graduated: it ranges from total coverage, in which none of the participants are aware of the research, to partial coverage in which some are informed and some are not. This raises an issue of great importance for the ethical evaluation of covert research – the issue of intentionality. In intentional covert research, the researcher deliberately conceals his or her identity to all or some of the participants, while in “unintentional” covert research, the researcher is unable to make his/her identity known. This is the case, for example, in research involving people suffering from dementia or mental confusion or fieldwork in which “concealment” of the researcher’s identity is a condition imposed by the gatekeepers that have granted the researcher access to the field. In these situations, the only alternative to covertness for the researcher is abandonment of the field and termination of the research. The problem of intentionality is linked to deceit. Those who conceal, entirely or partly, the reasons for their presence in the field have decided to lie to all or some of the participants. Those who cannot reveal their identity for the reasons mentioned above instead do so unwillingly and in this case deception is not involved. Just as it is not involved in all those cases in which it is simply impossible for the researcher to declare his/her identity. Consider, for example, research on a football fan club that requires participation in sports events with large audiences or participant observation of a street demonstration involving thousands of people. In both cases, it is impossible to inform everyone present. Just as it is impossible for the researcher to make known to people who are no longer alive

or with whom she/he no longer has a relationship that she/he has decided to use them as sources of data on past events involving or concerning them.

## Rise and Fall of Covert Method

For many years, covert method was widely used in the social sciences, and, on some occasions, it produced extraordinary results in terms of originality and depth of analysis: Goffman (1968) relied on his covert work at Saint Elizabeth’s Hospital in Washington DC as a ward worker, assistant to the gymnastics instructor, and porter to develop the concepts of “total institution” or “secondary adjustment”; Leon Festinger (2008) generated the concept of “cognitive dissonance” after asking some of his students to infiltrate a group of millennialists awaiting the imminent end of the world.

The social climate in universities and companies, above all in North America, which had previously been reasonably tolerant of this kind of study, underwent a dramatic change in the 1970s. A heated debate followed the publication of *Tea-room Trade*, Laud Humphrey’s study of encounters between homosexuals in the public lavatories of an American city. Humphreys’ (1975) research was considered a good example of what a researcher must never do: betray the trust of people who are substantially innocent, interfere in their lives, discuss them for the simple pleasure of receiving academic recognition, and violate their privacy for an essentially futile reason like writing a book. As a result of the spread of ethics committees and the doctrine of informed consent, covert research was soon banned for all scholars, including students. In many professional and associational codes, such as that of the British Sociological Association, covert research was subject to more or less explicit disapproval. A similar attitude was expressed in the 2015 *Framework for Research Ethics* (FRE) published by the Economic and Social Research Council (ESRC), the UK’s largest provider of social research funding: what is called “justified deception” is only permitted as a “last resort where no

other approach is possible” (Calvey 2017, 49). The Australian National Statement and the Canadian Tri-Council Policy Statement adopt the same principle. Since the 1980s, little has escaped the scrutiny of the censors, and only sometimes was it possible to read some timid study preceded by lengthy ethical and methodological justifications.

### **The Limit of the “Classical Paradigm”**

The prevalence of an intransigent ethical view focused on informed consent has been greatly favored by a concept of social life and the role of the researcher that has deep roots in both anthropology and qualitative sociology in the United States, based on the conviction that society normally operates in a consensual manner and that conflict is no more than a painful exception. Social scientists must play their part in this regard. First, they must favor the study of marginal and deviant groups, so that it can be shown that even they, if they are acknowledged and accepted, may be able to integrate into society and contribute to its effective functioning. Within the “do-good paradigm,” in order to describe and interpret the social life of a marginalized group, researchers must first win the trust of its members. Once the friendship and trust of the subjects has been gained, everything will go smoothly, and researchers will be gradually able to understand every aspect of the group’s culture by asking direct, sincere questions of individuals who are anxious to tell their stories and talk about themselves. Cooperation is simultaneously a value to be affirmed, an intrinsic feature of the social system, and a quality to be positioned at the core of research methodology if one wishes to obtain good results. In this scenario, the researcher’s self-concealment is pointless, dangerous, and counterproductive. It is an ethical error because it betrays the trust of the parties; it is also a methodological error because it compromises the results guaranteed by an overt method.

Intimacy and complicity between researchers and the communities that they study is reinforced by the fact that research of this kind is generally

carried out within just one group or organization, with which the researcher enters into a cultural and affective alliance. The ideal profile of the researcher thus becomes someone who has immersed himself/herself so deeply in the culture selected for study that she/he has almost become an insider. Knowledge is assumed to spring from empathy.

The reality is different; social systems, daily life, and organizational contexts are replete with uncooperative and disloyal behavior, hostile action, fraud, and deceit. People and groups prefer to keep some of their behaviors or ideas hidden, in the belief that they would not be socially accepted or acknowledged as legitimate and therefore might cause them harm. If a large part of social life is lived in the shadows, overt research is not always the best method for discovering the truth.

### **Present and Future of a Controversial Method**

Among other things, covert research can help groups and organizations discover more about themselves. If it were still possible to carry out covert research like Melville Dalton’s study on corporations (which showed in admirable fashion that companies are not just rational organizations, but also concentrations of racism and of power struggles among factions and informal networks), all of us – including companies themselves – would have information about that world far richer and more reliable than that available to us because it would have been acquired in great secrecy and would therefore furnish a far more authentic, and less hypocritical, portrait, like those photographs sometimes taken without the “victim’s” knowledge.

Ultimately, however, the admissibility of covert research depends largely on the “ethical position” of both the researcher and those who judge his/her research. In a non-consequential or deontological approach, where what counts is not the consequences of the actions but compliance with values considered absolute, covert research – especially when it involves intentional concealment of his/her

purposes by the researcher – is never permissible. Conversely, if a consequentialist and utilitarian approach is taken, it can be argued that a covert method may be justified by the results, scientific but also ethical, that it produces.

Important discoveries can be made on this terrain – ones that highlight counterintuitive and paradoxical elements. David Calvey (2017) worked for 6 months as a doorman in Manchester in order to create an account that might counter the widespread stigmatization of the bouncer profession. In Calvey's research, bouncers are described as people particularly interested in preventing violence, people with a code of honor, solid moral principles, and capable of, and interested in, cooperative work as a community.

Covert research can also uncover harmful activities. Critical approaches explicitly challenge consolidated power relations. In this case, the secrets revealed by means of investigative research and a covert method are more significant from every standpoint, the more they pertain to powerful social groups, for which secrecy is an important resource for maintaining or strengthening their power. By shedding light on shadowy areas, inaccessible places, and secret spheres, researchers contribute to the affirmation of important moral values such as the freedom to study and the transparency of information.

For almost 3 months, Brannan (2016) worked for a large international financial corporation. The official activity of the corporation was to protect consumers from the risks of the growing digitization of economic transactions and especially from identity theft. In fact, the financial company engaged – in agreement with banks that invited their clients to contact Praetorian's call center to activate their credit cards – in selling useless products. Brannan shows how fraudulent and dishonest activities were (not only) the result of wrongdoing by individual agents, but rather of how the organization's new recruits were trained, the values transmitted to them, and the practices that they were required to learn. All the information that should have been provided to clients so that they could perform informed actions was regularly – on implicit invitation by the managers – avoided or minimized. In some cases, the

lies were systematic: operators lied to clients that they would have to wait a few minutes for the credit card to be activated and then used that time to promote the corporation's products. In the field, Brannan disclosed that he was a researcher only to people with whom he had the closest contacts and never to the executives of the organization in order to avoid his dismissal. Brennan concealed his actions, but this helped gain better understanding of how some financial corporations operate.

Anthropologist Nancy Scheper-Hughes (2004) created a global ethnography of human organ trafficking. Working across four continents, with the assistance of graduate students, journalists, filmmakers, human rights activists, and private investigators, Scheper-Hughes accumulated an impressive corpus of information on the sale of organs and constructed a detailed map of this criminal traffic between the Global North and South. But to do so, she breached rules established by the community of anthropologists. On some occasions, her testimony helped the police authorities to halt the traffic. In other cases, she used covert methods: "I posed as a patient (or the relative of a patient) looking to purchase or otherwise broker a kidney. I sometimes visited transplant units and hospital wards unannounced, posing (if anyone bothered to ask) as a confused friend or family member looking for another part of the hospital. At times I introduced myself, honestly enough, to transplant staff and nurses as 'Dr Scheper-Hughes conducting an international study of transplant', while leaving it vague just what kind of 'doctor' I was" (2004, p. 44).

Scheper-Hughes asked her university to be exempted from its ordinary ethical surveillance procedures on the work of anthropologists and to use the more flexible ones of the school of journalism. From both a consequentialist and critical point of view, Scheper-Hughes's research appears to be largely justified, for it yielded extraordinarily useful research results. If Scheper-Hughes lied, she did so to obtain data that could not otherwise have been gathered. And those deceived were always the organ traffickers, never the victims. The research by Scheper-Hughes has suggested what we social scientists should increasingly do in a dreadfully unfair

world: use covert methods to study powerful groups.

The most powerful groups are generally also those most aware of the damage to their reputations that may be caused by investigative social research. They protect themselves carefully, resorting to rules of informed consent. Weaker subjects, by contrast, are often less well informed about the dangers and therefore more willing to be observed. For this reason, there is a great deal of research on marginalized, poor, and excluded outsiders, while studies on powerful individuals, which require the use of a covert method or a blend of covert and overt research, are rarer, even though they would probably be the most useful means to shed light on structures of power and domination. This paradox should be resolved by resurrecting the covert method, which has proved so fruitful in the past.

## Introduction

Over 3 months in the fall of 2011, more than 400,000 Americans moved billions of dollars from a bank to one of the country's more than 7,500 democratically controlled, not-for-profit credit unions as part of the first ever November 5th “bank transfer day” (Passman 2011). According to media reports, the mass movement of money resulted from a decision by some large banks to increase debit card fees set against the backdrop of the Occupy movement and generalized anger about the banking sector's role in the great financial crisis of 2007–2009. The premise seems to have been that since credit unions are co-operatives, they are ethical, cost-effective and pragmatic alternatives to banks, a view buttressed by editorials, blogs and surveys lauding credit unions as a form of “ethical banking” (Weinstein 2019).

But why might one expect credit unions<sup>1</sup> to be more ethical and maybe even more cost-effective than investor-owned banks? To some extent, the question has a trivial answer: credit unions, like other co-operatives, share a commitment to ethical norms of honesty, openness, social responsibility and caring for others as set out by the International Co-operative Alliance (ICA), an organization representing co-operatives

<sup>1</sup>Unless otherwise indicated, the term “credit union” as used here includes “co-operative banks,” which are the progenitors of the credit union movement and, as a result, very similar in terms of their commitment to co-operative ethics, values and principles.

internationally. These norms tie back to the ICA's statement on co-operative values, which consist of self-help, self-responsibility, democracy, equality, equity and solidarity. In turn, the ICA norms and values are framed by seven co-operative principles, the most important being, for the purposes of this discussion, the principle of democratic control and the idea that members should benefit from their ownership of the co-operative.<sup>2</sup> In short, credit unions exist to serve, not to exploit. Banks, by contrast, are presumed to be subject to the tyranny of short-term stock market expectations and potentially perverse incentives because of their profit maximization orientation.

But is this presumption about ethical credit union behaviour true? Survey evidence suggests that many people, even in countries with strong co-operative sectors like Canada, have only a dim understanding of co-operatives even as they share many of its values (Coletto 2020). They certainly cannot recite a list of co-operative ethical norms, values and principles. Further, many credit unions do little to promote the fact that they are co-operatives. Some refrain from using the words "credit union" in their trade names. More fundamentally, credit unions engage in the same activities as traditional banks, namely, taking and stewarding deposits and making loans. They share the same power to create money through the act of extending loans and, as a result, are exposed to some of the same incentives for bad behaviour. Failable humans govern both types of organizations against a backdrop of fierce competition, sometimes strained relationships with regulators and no small degree of pressure for credit unions to mimic bank tactics.

This more cynical view has its adherents. Following news of a high-profile scandal at the U.-based Co-operative Bank, finance journalist Frances Coppola (2015), for example, wrote that "we cannot assume that a bank or a financial

institution is 'ethical' simply because it is co-operatively owned, small, local or serves a particular market segment. Not-for-profit and publicly owned banks can be rotten to the core. . ."

And to be sure, the credit union trade press is not entirely bereft of news about bad credit union behaviour, with insiders recounting instances of fraud, corruption and unethical behaviour by management and democratically elected credit union boards of directors. More recently, a mid-sized Canadian credit union garnered attention after being placed "under administration" by its regulator twice in 2 years, the first time related to allegations of fraud and self-dealing by the then-chief executive officer and his son and the second time because of allegations related to selling unsuitable and high-risk investment products to members (Bradshaw 2020). In all these cases and others, however, credit unions – like co-operatives more generally – still seem to enjoy the benefit of the doubt. The question is why.

### Bad Banking Behaviour: Contrasting with Credit Unions

Notwithstanding some sceptical voices and occasional examples of bad credit union behaviour, academics have expressed little interest in the question of credit union ethics or even credit unions more generally.<sup>3</sup> There are two likely explanations.

First, the co-operative structure of credit unions means they don't have shares that trade on an exchange. As a result, they are not as visible on a day-to-day basis as publicly traded banks despite the fact that in some jurisdictions, they account for a quarter or more of all banking sector assets. Stock market prices provide easy-to-interpret signals; most credit unions emit only

<sup>2</sup>Member economic participation can happen through lower prices, dividends or patronage rebates that reward members proportionate to their use of the co-operative. The other co-operative principles are open and voluntary membership, autonomy and independence, member education, cooperation among co-operatives and care for community.

<sup>3</sup>A selection of journals devoted to business ethics were reviewed using the following keywords: "credit union," "banking" and "co-operatives." Similarly, the full range of journals (academic and trade press) devoted to credit unions and co-operatives, searching using the keyword "ethic" and variations thereof (e.g. ethics, ethical, ethically) were consulted.

once-yearly annual reports. With some notable exceptions, if a credit union behaves poorly, it will *ceteris paribus* generate less attention than a comparable bank. Second and relatedly, the absence of credit union ethics literature may simply reflect the growing academic literature about *unethical* bank behaviour. In a sense, credit unions live in the shadow of this literature, benefiting from a presumption that since they are not banks, they are ethical. It is worth, therefore, briefly exploring this literature on unethical bank behaviour.

Writing about for-profit banks, Lamb (1999, p. 13) is exemplary of much of this discourse. He writes that “naked pursuit of money, financial service has been called ‘a pollution intense environment’ rife with negative externalities or harmful side effects” where “top executives” are little more than “zoo keepers,” trying to steer employees away from unethical behaviour. He goes on to cite the seemingly irresistible pull in financial services to exploit the ignorance of customers that arises due to the complexity of the business (“information asymmetries”), the commodification of many financial products (resulting in thin profit margins) and the breakdown of the kind of employee-firm loyalty capable of nurturing a culture that can contain unethical impulses. Former bank regulator-turned-academic, William Black (2005) is arguably more pessimistic about the ethical prospects of investor-owned banks, titling his book *The Best Way to Rob a Bank is to Own One*. In it, he lays out the case for why banking tends to encourage deeply unethical behaviour by means of what he calls “control frauds,” situations where senior executive(s), rather than acting as zookeepers, actively exploit their privileged position for their own ends at the expense of society more generally.

Not all the literature on bank behaviour by banks is so grim. While Cowton (2002) acknowledges the widespread assumption that banking is an “ethical free zone,” he argues that this is a simplistic view that overlooks important underlying banking values that show up in everyday expressions like “bank on it.” He points to the three core ethical banking values, namely, (1) integrity and trust that protects depositor

money; (2) fair lending practices that are unbiased, patient when it comes to foreclosing and not so generous as to put the bank at risk; and (3) affinity relationships that aligns the bank’s values with a given segment of society.

To illustrate his framework, Cowton curiously cites case studies of the Co-operative Bank from the 1990s. At the time, the bank was owned by the British Co-operative Wholesale Society (CWS), which in turn was owned by retail co-operatives which, finally, were owned by their member/customers.<sup>4</sup> In 1988, the Co-operative Bank adopted a code of ethical banking behaviour to guide its activities and appeal to a segment (“affinity group”) of British society that worried about, for example, human rights, animal experimentation, factory farming and arms sales. In so doing, the Co-operative Bank set out to distinguish itself from banks that had been engaged in misbehaviour. In his analysis, Kitson (1996, p. 10) suggests that the Co-operative Bank’s commitment to these ethical guideposts was simply a “market-oriented re-statement of traditional co-operative values,” underlying again the bedrock belief even among academics that as co-operatives, credit unions and co-operative banks have a strong ethical impulse. But as Coppola reminds us, this re-statement may have been more public relations than anything else. Writing two decades after Kitson analysed the Co-operative Bank’s ethical code, Coppola (2015) notes that the scandal embroiling the Co-operative Bank’s then-chairman showed that “its commitment to ‘ethical banking’ was hollow.”

## Ethical Inertia

To recap, the view that credit unions are ethical seems to be premised on the fact that they (a) pay at least nominal allegiance to co-operative ethics, values and principles, (b) keep a relatively low profile and (c) are not banks. But this is not the

<sup>4</sup>The CWS has since become The Co-operative Group and is now owned directly by its customers.

whole story. Credit unions also benefit from a compelling origin story. There is a general agreement that credit unions grew out of the rural and urban co-operative banking movement that took root in mid-nineteenth-century Germany (Birchall 2011). In rural Germany, Friedrich Raiffeisen built a co-operative banking network focused on making small-dollar loans to poor farmers based on their moral character and reputation. In urban parts of the country, Herman Schulze set up co-operative banks to fund Germany's middle-class artisanal and guild-based producers that were otherwise struggling because of inadequate access to funds. Both co-operative bank networks were governed on the basis of a one-member, one-vote democratic principles, and their success hinged on a strong trust-based relationship between the bank and its members that minimized the kind of information asymmetries bemoaned by Lamb (1999). Both prospered and remain pillars of Germany's financial system to this day. Unlike bank competitors, German co-operative banks have never lost any of their members' deposits or had recourse to government support despite several major wars, bouts of hyperinflation, severe economic depressions and political instability.

On the basis of this success, the model spread to places as far afield as Egypt, Poland and Japan, but it was in North America where it emerged in the form of Raiffeisen-inspired "caisses populaires" in the Canadian province of Québec and credit unions elsewhere. Driven by the leadership of people like Alphonse Desjardins, Edward Filene and Roy Bergengren, the movement had, by the 1960s, mushroomed into tens of thousands of caisses and credit unions in the United States and Canada. In both countries, credit unions emerged as alternatives to for-profit investor-owned banks, serving underserved rural and lower-income communities; offering products that consumers could not obtain elsewhere easily; providing advantageous terms to niche market segments like the employees of a factory, business or union; or simply not exploiting members.

By the 1960s, the formation of new credit unions had begun to taper off. Since then, the

credit union systems in Canada and the United States have undergone a process of consolidation. In Canada, the 10 largest credit unions now account for almost half of all credit union assets, while the overall number of credit unions has fallen from more than 2000 to fewer than 240 today. While there is a persistent worry that the increasing size and complexity of a shrinking number of credit unions might rupture the trust relationship with members and local communities, there is evidence that credit unions are still living up to their co-operative promise. In the United States, the National Credit Union Administration (NCUA) data show that on average, credit union deposit rates are higher and lending rates lower than bank competitors, although some of these differences are likely due to the fact that US credit unions are tax exempt and their competitors are not. There is no ready evidence of this same price advantage in Canada, where credit unions are, with minor exceptions, subject to full corporate taxation. That said, Canadian credit unions routinely emerge at the top of customer satisfaction surveys among both retail (Ipsos 2020) and small business clients, with outsized market shares particularly in the area of small business lending (Canadian Federation of Independent Business 2016).

In both countries, the credit union business model has proven resilient, with studies showing that credit unions have often been better capitalized than their bank competitors (Higgins 2016), slower to foreclose on borrowers (Smith 2012), more supportive of lending to disadvantaged communities and generally good stewards of their members' money. From the vantage point of Cowton's (2002) standards for banking ethics then, it seems that credit unions pass the basic test – they generally behave with integrity and trust, use fair lending practices and have a long history of affinity-based relationships.

## Beyond Co-operative Ethics, Values and Principles

There is also reason to suspect that credit unions may benefit from a presumption of ethical

behaviour because of the halo effect arising from a handful of larger credit unions that hold themselves to ethical values that stretch beyond allegiance to ICA precepts. Miner and Novkovic (2020) call these “Type II Co-operatives” because they use their co-operative business model to help reshape the economic order by correcting what they perceive to be social, cultural and environmental injustices. Miner and Novkovic contrast these with “Type I Co-operatives,” which focus more narrowly on serving members fairly and with integrity. Type I co-operatives are usually centred around a particular community (affinity group), much as described in the historical credit union narrative and in alignment with Cowton’s view of what constitutes ethical banking.

Interestingly, some of the most prominent Type II credit unions have joined organizations that map out different or complementary sets of values and principles to those of the ICA but whose members consist largely of investor-owned banks. British Columbia-based Vancity, for example, is a longstanding member of the Global Alliance for Banking on Values (GABV). Created in the midst of the financial crisis in 2009, GABV’s mission is to help shape a more ethical banking sector that focuses on serving the real not financial economy in an environmentally, economically and socially responsible way. As part of that mission, GABV members pledge to uphold five core principles, namely, a focus on people, planet and prosperity, serving the real economic needs of communities, sustaining long-term client relationships, building a resilient business model and being transparent and inclusive in governance practices. While GABV’s 5 principles bear some resemblance to the ICA’s 7 co-operative principles, the vast majority of GABV’s 61 full members (as of September 2020) consist of conventional banks, not credit unions or co-operative banks.

Vancity and a handful of other Type II credit unions have also sought to deepen their commitment to ethical banking through something called “B-Corp certification.” Businesses that earn this designation are expected to conduct business that is sensitive to the needs of people and their communities. The pursuit of profit, in short, must not

come at the expense of community, the environment and stakeholders. To obtain B-Corp certification, a firm must conduct a self-assessment that yields a minimum score of 80 out of 200. From there, applicants are screened through a lengthy interview where B-Corp officials review key organizational policy documents. Further, B-Corp principles must be embedded in the articles of the corporate entity, thus binding directors to take them into account in their decisions. The certification body then periodically reviews the certified entity to ensure compliance. As with GABV, the B-Corp certification is available to all types of businesses, not just co-operatives and credit unions.

The fact that prominent “Type II” credit unions have pursued membership in, and certification from, organizations that also work with non-co-operatives suggests that for some at least, co-operative ethical norms, values and principles on their own may come up short. It also suggests that while the co-operative business model may lend itself to ethical behaviour, credit unions do not have a monopoly on good ethical behaviour particularly in the modern era where in many jurisdictions like Canada, regulators proactively guard against bad bank behaviour and where new business forms (like B-Corp incorporation in the United States) are taking root.

## Conclusion

It is reasonably clear that credit unions benefit from a broad-based presumption of ethical behaviour as evidenced by the “move-your-money” campaign, general media coverage and a paucity of academic research into credit union misbehaviour. This presumption appears to flow from the sector’s commitment to co-operative ethical norms, values and principles but, as importantly, from the simple fact that credit unions are not banks. As entities with one-member, one-vote organizational structures, the rules of the game in a co-operative are different than in a bank whose owners are incentivized to profit at the expense of their customers. In a credit union, the owners are the customers.

There is also reason to expect that credit unions have also benefited from the historical glow of an origin story rich with struggle for the betterment of the community. There is similarly reason to believe that the sector's reputation benefits from a kind of halo effect from some high-profile Type II credit unions that have stretched beyond traditional co-operative norms, values and principles. Yet as the efforts of these credit unions suggest, and as Coppola might concur, the co-operative nature of credit unions cannot guarantee ethical behaviour even if it does seem to predispose them towards right relations.

## Criteria for Ethical Authorship and Contributorship

Charon A. Pierson

Committee on Publication Ethics, Gilbert, AZ, USA

## Synonyms

Contributor; Creator; Ghost author; Gift author; Group authors; Guest author; Originator; Writer

## Definition

The word author derives from the old French word *autor*, meaning a person who invents or causes something. In the world of scientific discourse, an author is the creator of an idea, a product of dissemination related to an idea, or the originator

of a creative work (COPE Council 2014). Foucault (1969) wrote that throughout history, a “proven discourse” had to carry the name of its author to be considered authentic. Authorship today, as described by publishers, scientific societies, and regulatory bodies, includes an element of that authentication described by Foucault as an inherent obligation of authorship. Accountability for authorship is well recognized in the authorship guidelines promulgated by COPE, the International Council of Medical Journal Editors (ICMJE 2018), the Council of Science Editors (CSE 2012), with varying emphasis on an accountability statement promoted by other disciplines. It is possible that accountability is apparent in single-authored papers in some disciplines, whereas in papers written by multiple authors and research consortia, accountability is less obvious. Especially in research papers, there is a need for at least one individual to be accountable for the entire project regardless of how many authors or contributors are listed.

## What Are the Issues?

Ethical dilemmas surrounding authorship and contributorship are among the most common problems brought to the COPE Forum for discussion (<https://publicationethics.org/cases>). Guidelines for best practices to preserve and promote integrity in scientific publishing related to authorship and contributorship for journal editors are included in the COPE Core Practices (<https://publicationethics.org/core-practices>). Authorship can include work beyond writing of a manuscript in some disciplines; this is commonly called contributorship. In other disciplines, contributions to the development of ideas, theories, or supervision of work is recognized by acknowledgement only. Disputes among authors regarding listing of the authors (i.e., first author, last author, corresponding author) are a common issue. In other disciplines, listing of authors is always alphabetical and the list may include hundreds of names. Individuals sometimes dispute authorship on papers with claims they should or should not be listed, which can require a formal change of author lists by including, excluding, or

rearranging author names. Individual authors do not always have unique names or have multiple names by which they are known, leading to misidentification of authors. New proposals for contributorship models are still evolving. Clarifying what constitutes authorship is an important area for discussion with various stakeholders.

*Issues in publishing.* Publishers and journal editors have developed several approaches to solving authorship dilemmas. Editors are encouraged to post authorship guidelines and requirements on their journals’ websites. The guidelines should include statements requiring authors to attest to their role in the development of the manuscript and in some cases, a requirement for a declaration of percent of effort for each author in the development of the paper. For multiauthored papers, there may also be a required declaration from one author who takes responsibility for the integrity of the paper (COPE Council 2014). There should also be transparent processes in place for handling authorship disputes, including a requirement that any changes to authorship inclusion, exclusion, or order be agreed in writing by all involved authors. Editors generally will not publish papers until all disputes have been resolved and they retain the right to refer serious cases of authorship misconduct to the institutions where the authors did the work. Disputes arising post-publication are investigated when journals are notified and, once a decision is made that a correction must be posted to the article, editors can make the correction with or without the agreement of the authors. Authorship disputes can rise to the level of misconduct and result in sanctions by grant funding agencies, academic or research institutions, regional research ethics boards, and national government oversight bodies such as the Office of Research Integrity of the United States Government. Investigations referred to these institutions often take months or years to resolve; in the interim, an expression of concern can be attached to the article by the journal editor.

*Issues for authors and students.* The primary ethical tenet for all authors, whether students or academics, is one should not take authorship credit for work not done. Once the individual has assumed the authorship role, there is an obligation to be accountable for the work. For

individual authors submitting a manuscript to a journal, it is essential to read the author guidelines and adhere to all criteria for authorship to avoid delays in processing a submission. Authors should know and adhere to the norms of authorship in their disciplines. Order of authorship may also vary within disciplines, departments, or countries, but publishing is an international endeavor. Publishers may have additional rules for who can be considered an author and who can be considered the corresponding author (i.e., many editors prefer a senior author as corresponding author rather than a student). Although some authors believe that being the corresponding author is prestigious, most editors consider the corresponding author to be an administrative function and rely on that individual to be the contact with all the other authors on the paper; this may disadvantage students given the temporary nature of their location and contact information. Negotiations related to large projects that will end in publication should occur at the beginning of the project and all involved should understand their roles on the team. Authorship disputes will result in delayed publication or possibly a correction to the published paper.

Students can be in a vulnerable position when submitting work developed in their educational programs. If the university has a student handbook, there should be information included related to ownership of work projects, data management and sharing, intellectual property rights, and grievance procedures for students who believe they are being treated unfairly in their department. Students may not be comfortable asserting their opinions about the credit they think they deserve, and they may believe speaking out about their concerns will negatively affect their academic progress. Some students are promised authorship on papers from a department where they have little to do with developing the paper; this guest authorship is also unethical and sets up false expectations for students. An ancillary problem, sometimes called gift authorship, is faculty demands to be included as an author on any paper developed by a student during or for some period following the students' educational career. Learning to negotiate authorship roles and

placement on the author list is an essential developmental skill for graduates who plan to pursue research or teaching careers.

*New developments worth noting.* Confusion of author names has long been a problem for editors and readers. With similar names, the use of initials rather than full names, name changes due to court actions, marriage, or divorce, it can be difficult to know the correct name of the author of a paper. The Open Researcher and Contributor identification (ORCID) provides a unique identifier, free of charge, to any author. ORCID is a not-for-profit organization committed to the task of enabling "transparent and trustworthy connections between researchers, their contributions, and affiliations" (<https://orcid.org/about/what-is-orcid/mission>). Publishers have partnered with ORCID to integrate these author identification numbers into manuscript management systems and display them on the final published article. The unique identifier for each author allows permanent linking of all scholarly output to the correct individual.

Another initiative to standardize author and contributor roles is CRediT (<https://casrai.org/credit/>), the Contributor and Researcher Taxonomy, which describes the most common roles of contributors to research and publication projects. These 14 roles and their descriptions can facilitate discussion among authors about a division of labor for the project and have also been integrated into some manuscript management systems for publication with the eventual accepted article. Some of the roles are more closely aligned with traditional ideas of authorship (conceptualization, formal analysis, methodology, visualization, writing original draft, and writing the final version to include review comments and editing). Other roles seem to be supportive of the authorship role (data curation, funding acquisition, investigation, project administration, resources, software, supervision, validation) and might be more appropriately named as contributor roles. According to the implementation guidelines for CRediT, "The roles are not intended to define what constitutes authorship, but instead to capture all the work that allows scholarly publication to be produced" (<https://casrai.org/credit/>). The realization that

authorship is but one part of the research endeavor is important. Usually, credit for promotion and tenure or academic advancement is heavily weighted towards first author status, a benchmark that may be unrealistic today. Unrealistic and outdated requirements for the rewards of authorship fosters fierce competition for placement in the author list.

## Cross-Cultural Aspects of Leadership

David Coldwell  
School of Economic and Business Sciences,  
University of the Witwatersrand,  
Johannesburg, South Africa

## Synonyms

Cross-culture; Ethical leadership; Perceptions; Postgraduate

## Introduction

Cross-cultural differences in ethical leadership are evident worldwide despite the effect of globalization in converging values, business systems, organizations, and management processes (Cozma 2011).

Adam Smith (1976) was an early identifier of the importance of “custom” (culture) on perceptions of moral approbation (approval) and disapprobation (disapproval), in history and through cross-cultural differences. Smith (1976) noted in his seminal work “The theory of moral sentiments,” a distinction between: “moral consensus of absolutes” (natural or widely-held/common cross-cultural notions of right and wrong) and moral “custom” (bespoke, cross-cultural differences) perceptions of moral approbation and disapprobation.

Much more recently, an empirical qualitative study (Coldwell 2017) comparing perceptions of German and South African postgraduate students, regarding what constitutes ethical leadership, found nuanced differences in cross-cultural ethical perceptions, despite an underlying dimension of commonality that corroborated Adam Smith’s original distinction of “moral sentiment” into absolute and customary effects. The findings of Coldwell’s (2017) study suggest that cross-cultural differences are important in effective ethical leadership and need to be taken into account in promoting ethical management styles suited to specific cross-cultural contexts.

This chapter takes the following structure. First, a brief definition of ethical leadership is given which is followed by a description of the conceptual distinction between “*micro* and *macromorality*,” which is of core importance in understanding basic cross-cultural commonalities and underlying nuanced ethical leadership perceptual differences. Next, the findings of Coldwell’s (2017) study are briefly examined and discussed which is followed by the conclusion.

## Definition of Ethical Leadership

Swaner (2005) suggests that there are four main ingredients to ethical leadership. First *moral*

*sensitivity*: the ability to perceive ethical dilemmas through personal empathy. Second *moral judgment*: the facility to reason morally and decide on what ought to be done in specific ethical dilemmas. Third *moral motivation*: a personal commitment to moral action, and fourth *moral character*: courageous persistence to be ethical in a given situation.

Ciulla (2014) points out that the Greek idea of virtue in leadership discussed by Aristotle (1984) combines both *technical ability* and *goodness*. For example, a knife's function is to cut material, and in Aristotle's view (Aristotle 1984), a good knife cuts both effectively, well and without causing injury to the knife-holder. Thus, to be a virtuous (i.e., "morally excellent"; Merriam-Webster 2017) leader, it is necessary to be both technically competent *and* ethical/good. Also, for Aristotle, leadership and ethics cannot be considered separately: to be a good leader one must be effective and to be an effective leader one must be good.

### Macro- and Micromorality

Rest et al. (1999) distinguish between "micromorality" and "macromorality." Macromorality refers to the formal structure of morality in society in terms of its institutions, role structures, and laws. Micromorality focuses on specific, face-to-face interpersonal encounters and their perceptions of ethical and unethical behavior. Macromorality affects persons through rule systems and the law, whereas micromorality relates to persons through personal relationships and includes their perceptions of what constitutes ethical and unethical behavior, i.e., is this person trustworthy? Is this an ethical relationship? Micromorality is more influenced by cultural ethical *perceptions* which form the essential core of nuanced differences in cross-cultural perceptions of ethical leadership. Both macro- and micromorality are focused on the ethical quality of interpersonal relationships and social cooperation.

### Cross-Cultural Difference in Perceptions of Ethical Leadership: Findings of a Qualitative Empirical Study

Coldwell (2017) used a cross-cultural sample consisting of purposively selected postgraduate students that comprised a group of probable future business leaders. The sample consisted of 21 graduate Management and Human Resources Management students (10, 47% German and 11, 53% South African); the majority (95%) aged between 21 and 26 years old, who were participating in an annual International Summer School.

The measuring instrument consisted of student evaluations of the ethicality of two contrasting scenarios:

- *Scenario A*: A subordinate mentions feelings of tingling and numbness in the hand. The leader is aware that such symptoms can indicate a serious underlying medical condition that requires early intervention. The leader tells the subordinate of the potential seriousness of the symptoms and advises him/her to consult a doctor without delay. The subordinate asks for time off work to consult a doctor and the leader grants this, despite an important meeting at which the subordinate is expected to be present.
- *Scenario B*: The leader is confronted with the same medical problem and despite being aware of the gravity of the possible consequences of leaving it unattended, does not suggest the subordinate consults a doctor immediately. When the subordinate asks for time off to seek medical help, the leader reminds the subordinate of the important meeting where the subordinate is expected to be present.

A semistructured questionnaire was used which required respondents to indicate on a 9-point semantic differential scale ranging from "highly ethical" to "highly unethical," their ethicality evaluations of Scenario A and Scenario B. Also, qualitative data were obtained by eliciting comments explaining the reasons for Scenario A–B choices and justifying these choices by

their comparisons of the ethicality of the leader's behavior in the two scenarios.

Very briefly, Coldwell in summarizing the study states (Coldwell 2017: 211): "the findings of the study suggest the influence of cultural values on German and South African graduate Management students' evaluations of the ethicality of specific leadership behavior. The findings show that while both German and South African groups of graduate students regarded Scenario A's description of specific leadership behavior as more ethical than Scenario B, there were distinct nuanced differences between the two groups of students regarding their emphasis and evaluation of the ethicality of the leadership behavior described in the two scenarios.... These differences suggest the influence of cultural values. South African students appear to regard Scenario B leadership behavior as more unethical than German students do, and to emphasize the *absence of community awareness and the belongingness* of the subordinate in the leader's behavior. South African students regard the leader's apparent lack of concern for his *hierarchically vested responsibility* towards subordinate needs, as especially reprehensible. On other hand, German students seem to lay a greater stress on the *individual autonomy and responsibility* of the individual employee to attend to his/her own health needs."

The findings appear to suggest that while there was a general, *macromoral* commonality in cross-cultural perceptions of ethical leadership among postgraduates, there were significant *micromoral* differences in the underlying emphasis of leadership ethicality that could be attributed to culturally specific factors of "custom."

## Conclusion

Smith's (1976) contention that there is a central core of "absolutes" in what constitutes ethical behavior cross-culturally and of the influence of custom on underlying differences was broadly speaking corroborated by Coldwell's (2017) empirical study. Findings of the study revealed a

central core cross-cultural consensus of what constitutes ethical leadership behavior but one that showed nuanced but important differences stemming from custom.

Despite the pervasive and on-going effects of globalization, business leaders with different cultural backgrounds need to embrace ethical styles appropriate and relevant to the cultural context in which they operate. Global ethical "gate-keepers" need an awareness and sensitivity towards this fact.

## Cybersecurity: Critical Consideration for Boards of Growth Firms

Ruchi Goyal, Andrew Kakabadse and Nada Kakabadse

Henley Business School, University of Reading,  
Henley-on-Thames, UK

### Introduction

In contemporary times, cybersecurity is a momentous issue. Rapid and expansive digitalization in the era of the 4.0 Economy is characterized by interconnected devices autonomously making “intelligent” decisions without requiring human intervention. While it has potentially improved decision-making processes, it has simultaneously introduced risk to businesses in the form of cybersecurity threat. These cyber breaches have a monumental impact on not just the top and bottom line of a company, but also its reputation in the market (affecting its share value), litigation management, as well as customer loss, among other major drawbacks. Thus, many boards are getting involved, even creating executive committees to address this challenge successfully. How do organizations manage such cyber vulnerabilities? Does the answer perhaps lie in cybersecurity governance?

This entry attempts to answer such questions through developing a clearer understanding of the various aspects involved. It begins with examining the characteristics of growth firms and highlighting their reliance on stewardship of the governing boards. Next, the increasing prevalence of digitalization through the 4.0 economy is further understood to explore the subsequent concerns surrounding cybersecurity. Having thus set the background for cyber issues, the next subsection discusses the prominent issues concerning cybersecurity and an organization’s vulnerabilities it exposes. The solution is then investigated through incorporating cybersecurity as a critical element of an organization’s corporate strategy in the next subsection, before concluding the entry with closing remarks.

### Growth Firms and Their Boards

Growth firms have been identified as those with either employment-based or productivity-based fast growth, most prominent with small firms in the first 5 years of their lives (Du and Bonner 2017). Such firms abound in all sectors of the economy, including manufacturing, business services, and other service sectors. The interesting point underscored by studies is that having high/fast growth firms in a particular sector or industry contributes to subsequent growth for that industry overall (Bos and Stam 2011). Thus, growth firms are not only beneficial for themselves turning into potential mega-firms of the future, providing employment, boosting the industry sector, they also lead to the development and growth of the economy.

This further highlights the behavior of growth firms, vis-à-vis their strategic plans for growth, their identification of their competitive advantage, propensity for risky R&D, and innovation challenges. It has been seen that such firms often respond to economic crisis and competition through investments in product innovation and development into international markets. They have been seen to be more amenable to investments in the field of R&D and responding actively to innovation challenges. With time, as the firms grow older their strategic choices may align more with predictability and lower associated risks. Their strategic choices bear, in turn, largely on their governing boards and the way they envision the firms’ future.

Aiming to metamorphose into large conglomerates of the future, growth firms especially rely on their corporate boards to thrive. In such firms, the focus is to bring on board directors with ample expertise and access to other resources, which will reduce their environmental dependency and thereby, future uncertainty. Often, high-technology firms or other firms with large R&D focus tend to be often resource poor. To resolve this resource impoverishment, the firms specifically rely on the outside board member capital – which encompasses human, social, and financial capital (Clarysse et al. 2007) that would allow the young growth firm with the necessary

access to the resources and a potential source of competitive advantage.

In addition to providing access to resources, the stewardship role of governing directors is another prominent feature in governance of growth firms. Besides monitoring the management, providing support, and crafting and drafting the organizational strategy, the board's multi-pronged role as mentors/stewards is vital for growth firms, as opposed to their larger counterparts. Since such firms rely on technology as a corporate asset – including customer information, employee data, intellectual property, and other elements of their cyber identity – the company's development through technological survival becomes an indivisible element of a director's stewardship role.

Another characteristic feature of growth firms is their reliance on their founder for strategic direction that the firm adopts, as well as the possibility of CEO duality. Studies prove the frequent incidences of the firm founder being on the governing board as well a member of the top management team. This has further implications on the board dynamics at play when it comes to strategy making for the firm, including for agenda items such as technology resources and cybersecurity processes. Boards under a strong influence from the firm founder and working in a unified fashion would be far more likely to act fast and with more flexibility for situations arising out of the dynamic nature of issues, as is the case with cybersecurity concerns.

Thus, for identifying its competitive advantage, firms often look either inside the firm or outside the firm in the market. Technological uniqueness may provide the firm, the technology to act as a potential source of competitive advantage to the young entrepreneurial firm. Thus, for a growth firm, the dynamics of the board, and the firm's reliance on technology as a value-creating asset, weigh heavily on its decision to identify its competitive advantage with respect to its future vision for growth. However, the contemporary dynamic of an increasingly digitalized world adds another layer of complication for the growth firms, which is discussed in the following section.

## 4.0 Economy of Today

Historically, the above two factors of an organization's board dynamics and its dependence on technology may have been sufficient to influence its vision and strategy for technology. However, in today's scenario, the world of technology itself is far advanced than it has ever been, and it may be expected to evolve consistently. The impact of interconnected devices, autonomously making decisions, not held back by the need for human intervention, are the standards of technology in today's era.

This 4.0 economy has been characterized by jargons of the digitalized world of today – Artificial Intelligence (AI), Cloud Computing (CC), Machine Learning (ML), Internet of Things (IoT). Even for an ordinary firm outside the scope of automated manufacturing or high-technology industry, the above technologies signify a digitalized world characterized by automation, connectivity, and intelligence (Piccarozzi et al. 2018). In such a context, whether an organization functions in the technology industry or not, their reliance on technology is higher than ever before. Thus, safeguarding an organization's complicated cyber-realm is critical in today's 4.0 economy.

Unlike firms of yesteryears, which ordinarily relied on hiring an individual/team to fulfill the technology requirements of the entire firm, today's firms are characterized by more top-centric strategic focus on technology. Increasingly, technology as an element of strategy dynamic is in the purview of the governing boards, instead of centered in their technology department or on the technology member of their executive team. Preempting technological concerns and preparing for them with adequate investment, expertise, experience, and insurance is a priority for organizations and their apex bodies. The focus, thus, on these apex bodies/governing boards is to incorporate technology as a focal point of their strategy.

This is not to exempt the need for the organization to recognize cyber concerns as an enterprise-wide risk. However, the perspective has evolved to appreciate involvement of the top

of the strategic pyramid – the governing boards – while ensuring the rest of the firm’s participation in cyber-vigilance. Since many cyber campaigns target an organization through its most vulnerable touchpoints (which are often its employees), the onus is on the entire firm to be vigilant against cyber vulnerabilities. But what are some of these cyber vulnerabilities and how are they significant issues for growth firms? This is explored in the next section.

## Contemporary Issues with Cybersecurity

### Cybersecurity As Vulnerability

Cybersecurity as a construct has been relevant since the past few decades, when early mentions of “*cyberwar*” (Arquilla and Ronfeldt 1997) were enough to provoke a global fear among the academic and intellectual community. However, in the current millennium it has moved from a fictional to a credible threat status. Organizations are exposed to cyber vulnerabilities, from malicious campaigns by both state and private actors. Hackers, hacktivists, organized criminals, and states are responsible for cyberattacks, which have had and continue to have calamitous impact on their victims.

Reputational, financial, and legal costs worth billions, and sometimes enough to demolish a firm, have made the cyber realm a potentially dangerous and vulnerable world. Furthermore, being virtually impossible to protect through usual borders/boundaries, the challenge to protect and safeguard assets is further complicated and magnified. While large organizations with potential of large losses most often cannot avoid unfavorable attention when such events occur, this does not mean that smaller sized firms escape such attacks. Traditionally, security threats were less vicious, which could have been natural disasters, theft of hardware/software, unauthorized access, or human error (Loch et al. 1992). However, in modern times these have become more hostile and targeted, as hacking and cyber terrorism continue to rise.

One way to approach cyberspace attacks could be to first identify the potential point of entry of

the threats themselves. Access points to the organization are often the vulnerabilities targeted by cyber criminals. These could be through proximity (through a victim’s network), through an insider (unwitting players fooled into sharing access), supply chain (through software/hardware doors), remote (hacking), or even denial or access (flooding the victim’s server incapacitating it). Thus, the burden of maintaining cyber integrity lies not only on the shoulders of the governing board, but the entire machinery of employees and other stakeholders.

### Concerns Arising Out of Cybersecurity Vulnerability

Increasing practitioner reports, academic studies, and policymakers’ surveys outline the status of cybersecurity as a focal point in contemporary times. The National Cyber Security Centre, as a unit of the Government Communication Headquarters, is the UK government’s initiative toward ensuring a safe and strong cyber realm for individuals and organizations alike. Keeping a close eye on the developments in the field, it has recently reported an alarming increase in the incidences of cyberattacks on organizations (46%). Of these, the majority were from phishing campaigns (86%) in recent times. Subsequently, an increasing number of governing boards (80%) of organizations are realizing the need to turn the strategic board spotlight on cybersecurity.

Within the UK alone, an average FTSE 100 firm is expected to have a permanent decline in its share value of about 1.8%, which in financial terms may be translated to about 20 million GBP (CGI-Oxford study 2017). Figures such as these highlight the severe impact of cybersecurity lapses and incidents on organizations today. Whether the firm operates in the field of technology or not, its reliance on technology for its operational functionality or as a repository of useful company information, renders it susceptible to menacing cyberattacks aftermath. Given that such attacks may very well originate at the hands of an over-eager individual, or an organization, or even an enemy state, magnifies the risks that organizations must come to terms with.

Hackers (individuals with potential for cyber-attack) are frequently in the news for having gained illegal access to and with potential toward wreaking havoc. An American teenager recently hacking the social media accounts of Joe Biden and Bill Gates is a case in point. Similarly, there are increasing incidences of states (intelligence agencies sponsored by the government) accused of sinister attacks on organizations. The recent attack on SolarWinds software in the USA in December 2020, likely perpetrated by over 1000 engineers in Russia, may be considered the largest and most sophisticated attack ever seen. Besides these, there are also the potential dangers from hacktivists (collective groups trying to influence decision-making) and organized criminals (extortionists on the internet), who pose extreme and unparalleled risks for organizations to shield themselves from.

The state governments and policy makers are aware more than ever, of the growing need for cybersecurity awareness, and the need to have policies and bodies in place, which ensure prevention and addressal of cybersecurity concerns. In the USA, Security and Exchange Commission (SEC) and the IT Governance Institute have been placed to supervise transactions in the cyberspace. European Union's General Data Protection Regulation (GDPR) (implemented from 25 May 2018) mandates that companies conduct privacy risk-impact assessments to analyze the risk of data breaches. Closer home, in the UK, the Ministry of Defence has several bodies assigned to this task, like the National Cyber Security Centre mentioned earlier.

The attacks/breaches can last anywhere between nanoseconds and years, but losses are considered in four primary categories – confidentiality, integrity, availability, and indirect loss (Finnemore and Hollis 2016). Subjectively viewing the corresponding costs of these losses, the firms need to build capabilities to develop sustainable defenses, rather than merely purchase or employ them. When the defenses are of a self-sustaining nature, there is hope for them being adequate when the need arises. Thus, governing boards of growth firms must equip themselves through cyber preparedness to achieve any

tangible safeguards toward cyber vulnerabilities. Delving further into the strategic aspect of cybersecurity is the next section, where incorporating it as a critical element of strategy offers security to a growth firm.

## **Cybersecurity As a Critical Element of Strategy**

Corporate oversight allows boards to preempt the risk associated with cybersecurity and strategize accordingly. For growth firms, this oversight function needs to be more nuanced through a board's stewardship role, outlining a customized evolved process which evaluates and addresses cybersecurity risks and offers solutions effectively. In the absence of absolute certainty (which may never be a feasible reality in this field) and perfect solutions, the above may be the most practically reliable solution available to corporations. This could even be replicated by other policy makers even at a state level.

The governing board along with its executive team has to determine if the competitive advantages are being created from these opportunities, while simultaneously dealing with the risks (Grove and Clouse 2017). Since business technologies are integral to how businesses operate, boards need to acknowledge the need to prepare for IT as a resource at the board-level, instead of delegating it. As discussed above, firms need to invest in their information or business technologies based on their perception of risks and the value that the technology adds to the firm's business.

Furthermore, in the digitalized world of today, there is an increasing need for organizations to work together with policy makers, in strengthening their cyber realm. While government and state authorities create policy and take action, organizations ought to incorporate cybersecurity as part of their strategic component (Cunningham and Head 2019). Just as workplace safety and security measures are part of the business culture, so do efficient cybersecurity practices need to be ingrained in the normal course of business. For organizations, a successful response to cyber

vulnerabilities could certainly be an investment worth making for all the reputational, legal, and financial costs it would save.

## Conclusion

Governance of cybersecurity does not merely apply to the administration of threats, rather it extends to ensuring a framework in place under which all future potential threats could be readily addressed, with a top-down approach. The board's role as a steward thus encompasses this critical aspect of incorporating cybersecurity governance as part of their strategic mindset. For any ordinary firm, these choices will most likely shape the probability of their surviving in the future, while for a growth firm these determine their ability to establish their market dominance thus securing their future.

The first step, then, is for the board to turn the spotlight on cybersecurity as a strategic agenda item. Evaluating and improving organizational resilience to cyber campaigns is going to be the task of governing boards, as they craft corporate strategy. Having strategically prepared for cyber-related eventualities, organizations then need to ensure that measures are adopted by the entire organization and all the stakeholders involved. For growth firms to be able to continue growing and become the potential *unicorns* of tomorrow, cybersecurity as a critical element of strategy is vital.

## Data Ownership and Data Sharing Practices

Charon A. Pierson  
Committee on Publication Ethics, Gilbert,

### Synonyms

Data policies; Data stewardship; Integrated science; Intellectual property; Nanopublications; Open data; Open science

### Definition

Research-generated data are generally regarded as intellectual property and entitled to legal protection or copyright; however, ownership of those rights may be governed by institutional policies. Implicit in the idea of ownership of data is the concept of stewardship of data, including access, creation, modification, sale, storage, and the ability to assign or license any of these privileges to others. Open data and open science promote sharing research data gathered by scientists to verify scientific findings, reduce the financial burden of conducting research, and improve the reproducibility of scientific studies (Editorial 2018). It is also widely held that open data decrease the cost of research by fostering multiple projects from one data source, although there are costs

associated with transforming and maintaining data in a repository where others can have access. In contrast, funding agencies that review, approve, and fund competing research grants can claim ownership of the data generated by a researcher; this is especially common in pharmaceutical or device companies that fund a researcher in an institution. The USA and other governments and philanthropic organizations that fund researchers for scientific projects usually award the grants to an institution and not an individual, thus making the institution the owner of the data and further complicating the issues. Data ownership policies and guarantees of data integrity are necessary for proper allocation of rights and privileges and for data sharing to be of any benefit. The FAIR Data Principles (Wilkinson et al. 2016) are a guide to maximizing the value of shared data by making it *F*indable, *A*ccessible, *I*nteroperable, and *R*eusable.

### What Are the Issues?

The mission of the Center for Open Science is to “increase openness, integrity, and reproducibility of research” (<https://cos.io/about/mission/>), a part of which includes data sharing. Data ownership and data sharing policies vary widely among scientific disciplines. Transparency in research and its dissemination supports accuracy and reproducibility in science with the TOP Guidelines, which have been implemented by more than 1000

journals and other organizations (<https://cos.io/our-services/top-guidelines/>). The Transparency and Openness Promotion (TOP) Guidelines promote best practices in managing the essential elements of transparency in research outputs to enhance reproducibility of scientific research (Nosek et al. 2015). Essential to this openness is sharing of databases among interested readers and researchers. A topical list of publicly available databases is maintained by GitHub (<https://github.com/awesomedata/awesome-public-data-sets>), and, although not all the databases on GitHub are free, information on access, rights, terms of use, and costs are included. GitHub also hosts directories of metadata, i.e., the underlying description, context, and standards for research data in various disciplines; metadata make deposited research data more identifiable and useful. There are many other open data repositories such as Figshare (<https://figshare.com/about>) and Dryad (<http://www.datadryad.org/>) well known to researchers and academics; others are easily discovered by searching on the term data repositories. Some journals have data deposition and sharing policies, including policies of peer review of the data in conjunction with manuscript review. Some researchers share their own data directly with other researchers. Large research institutions and some specialty societies maintain data repositories for their faculty and members, respectively. Confidentiality is an issue with some sensitive data such as health information and other qualitative data where de-identification of participants is not possible. Concerns over theft of intellectual property also arise when data are shared; therefore, academic and other institutions may have policies prohibiting data sharing for patentable discoveries. Financial or business conflicts of interest, where real or perceived, can also result in policies prohibiting data sharing.

*Issues in publication ethics.* Questions about published research come from peer reviewers, editors, readers, granting agencies, other authors, journalists, and regulators. An accurate response to some of those questions might require a review of the materials, code, and data underlying the publication. Data sharing is fundamental to allowing external review of a

research project as well as replication of the results. Recent attempts to replicate findings from social science research indicate that only half of previously published, classic studies can be replicated based on the described materials and methods. Some scientists have called this a “crisis,” while others see more positive effects such as increasing requirements for preregistration of protocols and data sharing (Open Science Framework: <https://osf.io/8cd4r/>). The TOP Guidelines address standards for data citation; data, materials, and code transparency; design and analysis; preregistration of studies; and replication. At the most stringent level, journals would require verification of all standards by data reviewers prior to acceptance and publication of an article. At a minimum level, journals state their requirements, and authors are expected to comply by disclosing the appropriate information. Journals claiming peer review of data should clarify the level of peer review the data receive. When data are published as a part of supplementary material to a peer reviewed article, that does not always mean that the data have been reviewed, verified, or validated. Peer review of data might mean simply that the data are appropriately formatted for reuse by others.

*Challenging issues.* Data integrity is essential for meaningful sharing of data. Ownership of the data implies an ethical duty to safeguard the data from corruption by proper storage and maintenance and guard the data from improper use. Some large data repositories include financial and sensitive health information in available data sets; data sets can be purchased and used for health research or to target potential consumers with directed advertising. Accordingly, data repositories must allow and require complete de-identification of individuals in clinical data sets (Figueiredo 2017) to be considered an ethical option. Assurances of data integrity are essential whether the data are used for critical public health research or marketing of new movies. Maintaining and sharing data can be costly and complicated for authors as evidenced by the data availability policies at PLOS One (<https://journals.plos.org/plosone/s/data-availability>) and Springer Nature (<https://www.springernature.com/gp/authors/research-data-policy/faqs/12327154>)

publishing groups. When the move toward open science and open data began, publishers did not have infrastructure at the journal level to support data curation, which they addressed by seeking collaborative relationships with new and existing data repositories. Costs of depositing data include organizing and curating data sets, assigning persistent identifier (PID) numbers or digital object identifiers (DOI), which might be required for the publication of the associated research paper, and adding metadata to the dataset to increase discoverability. Other requirements with potential charges include access to the deposited data by readers and other researchers. Most or all these costs are borne by authors and researchers themselves.

*Issues in academia.* Another benefit of data publication in addition to the sharing of the data for reuse by other scientists is recognition of all the contributions involved in the conduct of research. Describing those contributions was the aim of the CRediT initiative. The Contributor Roles Taxonomy (CRediT) is used by publishers, institutions, and funders to better “represent the range of contributions that researchers make to published output” (<https://casrai.org/credit/>). For universities adopting the taxonomy, policies at the institutional level would recognize and reward activities such as data curation, formal analysis of study data, development of software code to run analyses, management and provision of materials and resources such as laboratory samples, and validation of results as significant contributions to successful publications. Currently the standard for promotion and tenure in academia is authorship with little recognition for other essential roles in the production of scholarly publications. Academic libraries are becoming repositories for nanopublications (<http://nanopub.org/wordpress/>) and essential to the dissemination of uniquely identified and attributed research data, which further contributes to recognition of researcher roles and outputs. Authorship of a nanopublication, such as a research dataset, is another step toward academic recognition and reward for those researchers who are not actual authors of a journal article. For funders, the taxonomy provides some standardization in

describing the roles referenced in grant submissions and enables better tracking of funded contributions.

## Deception and Research

Davide Barrera

University of Turin and Collegio Carlo Alberto,

## Synonyms

Disguised purpose and research; Ethically regulated deception and research

## Introduction

Deception is used as a methodological instrument for various purposes. For example, in

experimental research, if participants were fully informed about the aim of the study their behavior could be altered and unspontaneous. Similarly, in ethnographic research, sometimes full disclosure of the researcher's identity and goals is not feasible, because the behavior of research participants can be disturbed if they are aware that they are being observed. Formal norms and institutions that regulate the use of deception in research are inspired by ethical concern for the health and well-being of research participants and developed primarily with a focus on biomedical research. While various forms of deception are commonly used in behavioral research, the ethics codes of most professional associations explicitly regulate use of deception. As a result, the use and status of deception varies considerably across scientific disciplines.

### What Is Deception?

There is no consensus about what constitutes deception in empirical research. However, a minimal definition of deception can be based on commonalities across different fields. These definitions converge on considering deception as the *explicit* and *intentional* provision of false or misleading information about facts or people involved in a study. Deception of research participants can thus occur mainly in two ways: actively lying, or concealing essential information through omission or partial disclosure. The extent of lying can vary greatly in intensity, and lying is common especially in experimental research, though not restricted to it. In nonexperimental research, researchers sometimes lie about their own identity, for example, in studies employing covert participant observation. At one extreme, lying about the true purpose of an experimental study is a mild form of deception that is very common. At the opposite extreme, sometimes research participants have been placed in situations in which almost nothing is what it is purported to be. Milgram's controversial experiments on obedience to authority provide a notorious example. In these studies, participants were told they were taking part in a study on the effects of

physical punishment on learning and they were lead to administer electric shocks to other persons, when they failed the learning tests. In reality, the electric shocks were simulated and the person apparently receiving the shocks was an accomplice of the experimenter, instructed to act as if he was enduring severe pain. In between these extremes, in many experiments involving interactions, participants engage with research confederates, or with a computer program simulating the behavior of the other person, while they are told the other person is a real participant like themselves. Asch's conformity studies provide a classical example of this form of deception. In these studies, Asch employed several confederates at once, instructed to give the same wrong answer to a very simple visual test, in order to create a normative pressure towards conformity. Nowadays, extreme forms of deception, such as Milgram's, are no longer permitted. However, using confederates or simulated partners is still very common. For example, in social psychological studies on cooperation within groups, the interactions are usually computer mediated and research participants are often told they are interacting with real partners, while in fact all other group members are simulated. This form of deception is used to enhance control and experimental validity by ensuring that the experimental stimulus is truly identical for all participants in the same experimental condition.

Partial disclosure or concealment is a subtler form of deception tolerated in most areas of behavioral research, with some caveats or limitations. In experimental research, concealing the true purpose of a study is customary. However, it is hard to draw a line separating relatively innocuous and legitimate economy with the truth from provision of incomplete information leading participants to form false beliefs about the nature of the situations in which they are involved. In other areas of research, concealment may concern the way researchers obtain and store the data. For example, an interviewer could use audio- or video-recording equipment, without informing research participants. Each form of deception raises various ethical concerns, and the ways in

which they are addressed differs between disciplines and countries.

While mild forms of concealment are used in various research areas, explicit deception is typically associated with experimental social psychology. The experimental method became paramount in psychology in the first 30 years of the twentieth century, contributing to the establishment of psychology as a science. Subsequently, social psychologists began to use deception to exert control over the experimental stimulus, which in their field typically consisted of other people's behavior. Historically, deception was very uncommon before 1930 and limited to less than 10% of the articles published by the major social psychology journals between 1930 and 1945. However, the 1950s and 1960s witnessed a sharp increase in the frequency of deception, eventually leveling off in the 1970s, when about 50% of the articles published by the most prominent journal in the field – the *Journal of Personality and Social Psychology* – used deception (Korn 1997). The rapid increase in the frequency of deception starting in the 1950s was accompanied by a change in the quality of the deception used in psychological research. Due to the influential work of Kurt Lewin and Leon Festinger, experiments became increasingly complex and typically made use of elaborate deceptions involving confederates, complicated scripts, and cover stories.

## Regulation of Deception

In the USA, the institutionalization of ethics rules concerning research involving human subjects was accelerated by a few infamous cases of severe ethical misconduct in biomedical research that became public in the early 1970s. In the same period, the publication of Milgram's studies on obedience to authority opened the debate about the protection of research participants in experimental social psychology. In 1981, the United States Department of Health and Human Services issued a set of rules for conducting research involving human subjects – known as the “common rule,” drafted primarily for human experimentation in biomedical research. Strict

interpretation of the principles regulating informed consent would make the use of deception impossible in experimental research; however, the National Science Foundation provided guidelines that allow Institutional Review Boards some flexibility, especially with respect to informed consent in behavioral research involving deception. In other countries, national codes of ethical conduct in human research explicitly regulate exceptions to the requirement of informed consent for those studies that would be impossible to conduct without partial disclosure or explicit deception. For example, the Canadian Tri-Council Policy Statement permits alterations of the consent requirements if (1) the study involves no more than minimal risk for the participants, (2) the proposed research cannot be conducted if informed consent is required, and (3) at the end of the experiment participants are allowed to withdraw their data, if they wish to do so. Similar clauses regulate exceptions to the consent requirements in the Australian National Statement on Ethical Conduct in Human Research. Furthermore, The Australian National Statement requires that the potential benefits of the proposed research involving partial disclosure or deception arguably outweigh the risk to the community's trust in research and researchers.

In addition to the national codes of conduct, several professional associations have published ethics codes that provide rules for use of deception. For example, the Code of Ethics of the American Sociological Association (s 12.05) and the Code of Conduct of the American Psychological Association (s 8.07) both allow deception when it is (1) justified by the prospective scientific, educational, or applied value and when alternative procedure to conduct the same study without using deception are not available and (2) reasonably expected that it will not cause physical harm or severe emotional distress to the research participants. In each case, when deception is used, researchers must inform their subjects as early as possible of all features concerning the study in which they participated. In addition, psychologists developed a specific procedure, debriefing (see APA 8.08), to ensure participants are adequately informed about the study and

offered the possibility to withdraw their data. The sociologists' code also specifies that researchers may need to conceal their identity under specific circumstances, provided the study does not involve any risk for the participants. Finally, both codes stipulate that use of any deception is subject to ethics approval by an Institutional Review Board.

## Research on Consequences of Deception

Since the early days of experimental economics, economists have argued against the use of deception on two grounds. First, when a participant is deceived in one study (and knows that deception has occurred), the participant could lose trust in experimenters and experiments. As a result, the participant's behavior would be biased in subsequent experiments. Second, as it becomes common knowledge that scholars of other disciplines (e.g., social psychologists and experimental sociologists) deceive their participants – for example, because introductory textbooks or university lectures describe experiments that use deception – even participants who have never been deceived by researchers will tend to suspect deception. Thus, their behavior could be altered as a result (Hertwig and Ortmann 2001). The major journals that publish experimental research in economics do not accept the legitimacy of deception. However, partial disclosure is permitted, as long as the information concealed to participants does not lead them to form false beliefs about the situation in which the interaction that is being studied takes place. By contrast, experimental researchers from disciplines like social psychology that regularly employ deception in experiments have argued that the use of deception is crucial to ensure control of the variables that are manipulated in the experiment and eliminate possible confounds (Cook and Yamagishi 2008).

Empirical studies of deception have addressed two basic issues: whether deceived participants are subsequently more likely to harbor negative feelings or attitudes toward experimental research, and whether suspicion resulting from the actual experience of deception or from

warnings that deception may be used affects the behaviors of participants during the course of a single experiment. Possible effects on the participants' feelings seem to depend on the nature and the severity of the deception employed. However, when negative feelings are reported, they generally do not alter the participants' behavior nor their trust in scientific research. Behavioral effects of suspicion have been found in research on conformity. For example, subjects who suspect that the other participants are confederates instructed to behave in a certain way are less likely to bend to social pressure. However, suspicion tends to produce a conservative bias in the results, i.e., increase the probability that the research hypothesis is rejected. When suspicion is deliberately stimulated – for example, informing participants, before the experiment, that some form of deception will be, or could be used – the behavioral effects of suspicion increase when the information on deception is more concrete and salient. Few studies have investigated the effects of experiencing deception in one study on the behavior of subjects in subsequent experiments. Firsthand experience of deception has been found to affect the participants' beliefs about the frequency of deception, but there is no evidence that experiencing deception systematically alters the behavior of participants. However, evidence about the impact of deception on suspicion and experimental results is inconclusive and may depend on a number of factors, including the severity of deception and which dependent variables are employed.

## Democracy and Governance: Toward a New Ethics of Decision-Making

### Synonyms

Horizontal decision-making; Partnership

### Definition

Governance is the subject of a wide-ranging academic literature – eliciting contributions from both social scientists and public servants over the last 30 years – yet its precise meaning remains elusive. The difficulty in establishing governance’s main tenets and conceptual parameters is due in part to the number of qualifiers that the term has accrued over the years: in addition to studies on governance writ large, one can also branch off into the examination of network governance, e-governance, corporate governance, global governance, and multilevel governance, to name but a few of the governance subfields. To these one can also add the studies of administrative science, the New Public Administration, the New Public Management, and “Reinventing Government” all of which examine governance through the lens of the modern bureaucracy. As a result of its numerous qualifiers and its wide range of associated subfields, defining the term

“governance” has proven to be a difficult and sometimes quite frustrating endeavor. This frustration has led one social scientist to title his review of an edited volume on governance, “Debating Governance: Whatever that Means” (Prätorius 2003).

Despite the ongoing search for governance’s precise meaning, studies of governance tend to center on three main research questions: Who makes authoritative decisions? How are authoritative decisions implemented? How should authoritative decisions be made? The answer to these questions is some form or another of “governance” which is also sometimes advanced (Rhodes 1997; Heinrich et al. 2010) as an alternative to “government,” a term that is used to describe an autocratic form of decision-making that is sluggish and highly bureaucratized. In light of these shared avenues of inquiry, governance can therefore generally be described as both an analytical tool used to identify the locus of power in modern democracies and a prescription for a new and more ethical form of democratic decision-making.

### Who Makes Authoritative Decisions?

In the age of cultural, technological, and economic globalization, a number of actors have emerged to challenge the state’s role as the sole sovereign decision-maker and as the only provider of public goods within a given territory. The study of governance has seized upon this development and, in so doing, has set out to determine whether the state remains the repository of legitimate authority and whether or not it can continue to “govern.”

There are three main groups of challengers to the state’s hegemony: 1. judicial, legal, and technical experts; (2) private enterprise, transnational economic actors, and global market forces; and (3) social movements and other forms of popular mobilization (Skogstad 2003). Each of these three groups represents a potentially anti-democratic source of authority in that they comprise non-elected decision-makers who are not directly beholden to the state’s citizenry. By

contrast, elected representatives are a legitimate source of “state-centered political authority” (ibid; 964) having been vested with the authority by the citizenry at election time to form a government and to deploy the state’s authority and resources.

“Network” governance has been advanced (see Rocher 2011) as one possible way of ensuring the continued relevance of the state and of democratic decision-making in the age of globalization. Here, governance is understood to be a partnership between voters, civil society, experts, and appointed and elected representatives that entails both collaborative and deliberative decision-making. A shift toward this form of partnership would replace a top-down model of “government” with a horizontal form of decision-making, with the state serving as a nexus between partners.

### **How Are Authoritative Decisions Made?**

One of the more hotly debated issues in writing on governance concerns the public administration, the set of institutions directly responsible for implementing authoritative decisions. There are three schools of thought on these matters: the New Public Administration, the New Public Management/Reinventing Government, and the New Public Service. The New Public Administration emerged as a field of scholarship in the 1960s within the context of great social and political upheaval. Its main advocates were social scientists who sought to clarify the methodology of administrative science in order to enhance the bureaucracy’s responsiveness to new societal demands and to ensure a more robust connection between citizens and governmental organizations. This vision of the public administration was one that did not disassociate bureaucrats from the dynamics of social and political life.

Roughly 30 years later, a New Public Management school of thought came to challenge the New Public Administration’s conception of the ethical standards of the public administration. By contrast to the New Public Administration, the principal innovators of the New Public Management were not academics; they were administrators, corporate and public managers,

and public commentators. Their main objective was to make the bureaucracy more efficient through the use and implementation of management strategies drawn from the private sector. According to this new philosophy, citizens were now to be seen as customers, increasing customer choice in public services and enhancing efficiency were to be the new mottos of the public administration, and authority was to be decentralized and responsive to customer demands. The Reinventing Government model of public governance also sought to enhance competition between different branches of the public administration to make public management smarter and leaner and to improve the provision of public goods and service delivery (Osborne and Hutchinson 2004).

One of the more recent trends in the governance literature calls for a return to some of the older values of the public administration. This trend, called the New Public Service, differentiates itself from the New Public Management’s wholehearted embrace of private sector efficiency. This normative understanding of the roles and goals of the public administration gives primacy to public service as a value in and of itself and advocates greater collaboration between the public sector and citizens in the decision-making process; its primary objective is therefore to enhance the quality of governance in democratic societies.

### **How Should Authoritative Decisions Be Made?**

The study of governance also entails discussions addressing the manner in which appointed and elected representatives should be making decisions in modern democratic states. These discussions focus on the quality of governance or on good governance, as it is otherwise known, and their analytical scope extends beyond the functioning of the public administration.

There are three main measures of good governance, one of which is the impartiality of decision-making; this means that “when implementing laws and policies...officials shall

not take into consideration anything about the citizen/case that is not beforehand stipulated in the policy or the law" (Rothstein and Teorell 2008; 170). A second measure of good governance is transparency in decision-making. This measure of good governance is largely employed to assess developing democratic regimes; due to a recent spate of corporate scandals (i.e., Enron, WorldCom) which have cost thousands of jobs and led to billions of dollars in losses for investors and shareholders, transparency has also become a key measure for the quality of corporate decision-making (under the guise of corporate governance). The third major measure of good governance is accountability which is to say the "answerability" (Wong and Welch 2004; 275) of elected and appointed representatives for their actions and performance. This measure has become increasingly important in the age of globalization due to the multiplication of viable competitors for public authority.

To be clear, there are perspectives on good governance (e.g., Fukuyama 2013) that focus simply on the performance of bureaucracies and governments, regardless of whether they are democratic or not. Consequently, the discussion on good governance mirrors the discussion on the roles, goals, and values of the public administration; in both cases, there is a tension between the need to get things done *right away* and the need to make decisions the *right way*.

## Democratic Decision-Making in Dewey's Ethics

## Introduction

John Dewey's (1859–1952) ethics challenges the destructiveness of those who act as though only their own concerns, habituated values, and received moral frameworks have overriding force when perceiving, diagnosing, and

ameliorating problems. Instead of developing a theory that predetermines which valuational standpoints and idealizations are worth taking up, Dewey's ethics calls for the arbitration of deeply democratic practices within and across individuals, political units, and institutions. Contemporary advocates for Dewey's broadly pragmatic and pluralistic approach argue that through it we may mature together toward a healthier, more just, more secure, more peaceful, and more sustainable future (e.g., Pappas 2019; Fesmire 2015; Johnson 2019).

### Dewey's Pragmatic Pluralism in Ethics

Professors of ethics try to help students face the shared problems that most concern us, chart a course to clarify and interpret what is going on from a wide social perspective, and critically inquire into these problems with fresh hypotheses. In these ways, professors hope their students will be enabled to take part in events instead of being swept away by them. In Dewey's view, this points to a pragmatic and pluralistic approach to making ethical decisions.

When making decisions, we are routinely pulled in multiple ways, none of which has overriding moral force. From a pragmatist perspective, the relative incommensurability of inherently discordant situational factors presents a *practical* problem for our moral lives (not primarily a theoretical one): if diverse factors are already in tension with each other, then unidimensional decision-making can lead to overly simplistic normative prescriptions that ignore or relegate factors that are objectively relevant to making intelligent choices. This is analogous to the logical fallacy of causal reductionism, assuming a single cause for a complex outcome and ignoring multiple conjoint variables.

A Dewey-inspired alternative is to challenge the assumption that we must suppress variability in valuing. Dewey criticizes the quest for a putatively more rational framework with which all ethical choices should conform. This is, he thinks, yet another iteration of the misguided quest for certainty. The still-prevailing tendency among

moral theorists is to infer, and perhaps impose, a standardized framework without consultation. Instead, moral theorists could highlight incongruous values and make emphatic cases regarding trade-offs. A vital role of ethical debate, on a pragmatic approach, is to clarify and advocate compensatory emphases that are most appropriate for a particular context. If that is all that is meant by "the right way to think about X," then such a pragmatic outlook can generate possibilities that are concealed by the insensitivity of overly formal approaches.

To the puzzlement of earnest utilitarian and Kantian ethicists who equate "doing ethics" with justifying crisp, principle-driven prescriptions about how we should act and assess, adaptive pragmatists like Dewey and Jane Addams (2002) take the good, right, and virtuous to be determined experimentally, contextually, and democratically. Pragmatists acknowledge that conformity with antecedently determined law, or ciphering aggregate well-being, may highlight relevant features of the situation when used as a tool for democratic "dramatic rehearsal," as Dewey framed his psychological description of the imaginative phase of moral deliberation in *Human Nature and Conduct* (1988; cf. Fesmire 2003). But they do not identify these methods as the mainstay of ethical decision-making.

For example, utilitarian welfarist number-crunching can tamp down on irrational prejudices, challenge our unreflective disregard for those with relevantly similar interests, devise risk-benefit models, inform technological algorithms, and thereby advance social and animal welfare. Such strategies should be evaluated like any other tool, by the work they do as helps in reliable decision-making. They are at least a counterweight to a do-nothing attitude about the welfare of others. What Dewey challenged was the aggregating moralist's quest for a predetermined metric whereby we judiciously weigh matters so that the balance automatically tips toward the optimal outcome supported by a universal welfarist principle – i.e., the most good we can do. The quest for a cover-all metric that is "right" once and for all is *not* essential to constructing quantitative welfare models and assessments. Dewey's advice is to

drain the theoretic bathwater while evaluating the functional-operational baby by its directive power.

Although utilitarian ethicists are distinctive for their aggregating emphasis, they are typical in their monistic assumption that there is a single right way to reason about morals. Mainstream monistic theorists, old and new, assert that their job is to show which antecedently defended, (relatively) static principles should govern choice. Once we get the theory worked out, then on this received view we can impersonally decide whose values measure up to its supreme metric. Start with getting the theory right, and the rest follows!

For both Addams and Dewey, in contrast, ethical and sociopolitical theorizing are not understood on analogy to logical or mathematical problems that have a correct formulation and computable solution. In tandem with twenty-first century discussions of wicked problems, design thinking, and systems thinking, decision-making in Dewey's ethics is a pluralistic experiment in "living together in ways in which the life of each of us is at once profitable in the deepest sense of the word, profitable to himself and helpful in the building up of the individuality of others" (1938/1988, 303).

The disanalogy between moral problems, on one hand, and logical or mathematical problems, on the other, spotlights what is perhaps the most distinctively "pragmatist" feature of Dewey's ethical outlook: his insistence that our choices and deeds are essential players in the moral situation. In contrast with British empiricism's influential notion of a receptive mind behind a veil of ideas, a lingering assumption within John Stuart Mill's associationist psychology which still pervades much utilitarian thought, Dewey argues that our encounters with the world are creative. Consequently, what is good or bad, right or wrong, virtuous or vicious cannot be completely ascertained prior to acting and reviewing.

Hypothetically, it may be that the simpler the problem, the more likely it is that reduction to a single ethical category will ameliorate the situation. It may equally be that the more complicated the problem, the more likely it is that

oversimplification will at least minimize the risk of moral paralysis or fatalistic resignation. These *pragmatic* hypotheses are *prima facie* plausible. Nevertheless, contemporary conflicts and disturbances are rarely so superficial that a theoretically correct rational analysis could, even in principle under ideal conditions, sweep the path clear toward what is "truly" good, right, just, or virtuous. Traditional monistic theories can serve the imagination that is required for wise moral deliberation (Dewey 1922/1983; cf. Johnson 2019). But whatever we see with their help is situated within what is inconspicuous. If we forget this, we pay for conceptual clarities by neglecting aspects of the troubled existential subject matter that occasioned our ethical inquiries in the first place.

## Democratic Intelligence

In the face of circumstances that overwhelm them, people tend to behave much like pinballs ricocheting around a machine. When we are reactively tossed around, we do not inquire and communicate, so we are unable to take part in democratically redirecting the course of events – unless democracy is reduced to the formal mechanics of "one person one vote," with duties exhausted at the polling booth. When we get caught up in a reactive cascade, we oversimplify situations, neglect context, take refuge in dogmatic absolutes, ignore possibilities for finding common ground, assume privileged access to the right way to proceed, and shut off inquiry. In this way, we make the worst of native impulses toward social bonding and antagonism. Debating and achieving controverted shared goals becomes impossible.

Detached calculations of optimal welfare by policy analysts may aid public deliberation, but Dewey argued that they should not simply be hung on a rack for the public to take down and wear without thought. Nor should expert analyses merely be translated into directives to those wielding executive power.

At the same time, Dewey rejected the populist alternative that we make choices based on how forcefully one group can drive home their point or

sell it in the marketplace of ideas. He rejected the false dilemma – stemming from a dualism going back at least to Plato – between aristocratic command-and-control decisions by society's enlightened few, taking one horn of the dilemma, and extreme populist mob rule, taking the other horn.

Dewey strove for a radically democratic ideal in his ethics and politics, but contrary to a common misperception of *The Public and Its Problems* (1927), he agreed with Walter Lippman's *The Phantom Public* (1925) that the “ideal of the sovereign and omniscient citizen” is unattainably romantic. Insofar as ideals are tools for reconstruction, this one is preposterously unhinged from experienced reality, akin in that respect to the temperance movement's ideal of prohibition. Dewey also agreed with Lippman that experts must communicate effectively by simplifying and interpreting complex events. What Dewey vehemently rejected was Lippman's anti-democratic coziness with paternalistic rule by technocratic elite experts who oversimplify problems so that citizens will accept the reality that is packaged for them and will not have to burden their provincial and parochial little heads. Prophesies of public stupidity are self-fulfilling.

In Lippman's view, there is no realistic hope that reorganizing education can put citizens in a position to steer the public ship. The ever-changing environment is just too vast and complicated, Lippman argues. Dewey agreed that the great question is how to bridge “the gap between the limited capacities of the citizen and the complexity of his environment” (Dewey 1927/1984, 216). Dewey's famous riposte to Lippman's pessimism about bridging this gap was to advocate a creative and adaptive democratic public that had no need for omniscience. By pooling accumulated knowledge, guided by expert experimental inquirers skilled in bringing facts to bear on social affairs, citizens can become educated enough to effectively participate at manageable scales to a degree that is sufficient for democratic decision-making. Democratic failings are symptomatic of many troubles, Dewey argues, but Lippman is confused about the *cause* of those failings: they spring not from democracy but

from “stupidity, intolerance, bullheadedness and bad education, whether these traits decorate a monarch, ornament an oligarchy or supply the moral insignia of the populace” (Dewey 1927/1984, 220).

In sum, Dewey did not have to be saved from excessive optimism regarding democratic moral and political decision-making. His later writings reveal a chastened, worldly-wise philosopher who nevertheless doggedly urged that we will be better off if we educate with an eye to creating a context for ongoing, shared inquiry. Against the aristocratic view, he urged that back-and-forth communication across tensions is necessary for effective decisions that simultaneously raise the general level of public intelligence. Meanwhile, he recognized the problem of populist clans of self-seeking individuals who are cut loose from communication with experts. Public processes fail to meet problems when the day is carried by individuals or groups who pretend to diagnostic expertise that they in fact do not have. A free democratic community cannot be maintained by populist masses, as these trend toward totalitarianism.

Dewey argues that democratic communication about moral and political problems, regardless of the formal political institutions such communication may plan and prescribe, maximizes the chance that we might find paths that respect legitimate interests, evaluations, and evolving identities of different individuals and groups. When “the decider” sidelines stakeholders, this raises suspicions about aims, interests, and background assumptions. An autocratic approach also raises issues of transparency and accountability, and it predictably leads, as Dewey observed in *The Public and Its Problems*, to myopic, unworkable policies (1927/1984, 235–372). When a decision-making process is more than nominally democratic, it strategically seeks out frictions and divergent voices, and it gains legitimacy and direction by evaluating them for their instrumental bearings, criticizing them, and incorporating them.

In opposition to elite rule in the vein of Lippman, Dewey consistently warned against overreliance on top-down, expert-driven decisions, and where practicable he advocated

participatory processes that enlist communities in social learning and knowing, fostering a public spirit of consultation to uncover troubles and to organize the expertise to deal with them. "The man who wears the shoe knows best that it pinches and where it pinches," Dewey wrote in *The Public and Its Problems*, "even if the expert shoemaker is the best judge of how the trouble is to be remedied" (1927/1984, 364).

Like the person wearing the shoe, stakeholders and their proxies are in a better position than detached experts to speak for themselves about how the difficulty pinches. Those who directly experience the pinch of the problem legitimately demand inquiry and a response, and they are contributors to embodied social knowledge. However, problematic situations do not come pre-packaged with one party's preferred explanations, their specific reading of the problem, or their proposed solutions. Moreover, all explanatory schemes are susceptible to the "availability heuristic," the well-studied psychological tendency to fall back on readily remembered mental shortcuts. Add this to the long list of reasons that a democratic public cannot avoid failures. Nevertheless, when experts and stakeholders appeal to each other and work in concert, a democratic method can better reach its potential to be creative, critical, and self-corrective by raising questions, imagining alternatives, putting ideas to the test, and disclosing differences that might otherwise have escaped notice. At the same time, democratic participation can reduce apathy, build community, and create consummatory value from what had been a Babel of meanings (Dewey 1927/1984, 324).

As long as communication has not completely broken down, Dewey held that a democratic education, initially learned at a neighborly scale, can at least somewhat curb our tendency to overreach – that is, to predefine moral and political problems by presuming that our formulations of them were somehow already baked in. Again, he held that education has the mostly unrealized potential to curb this tendency enough to underwrite participatory decision-making, if only we will muster the confidence to end our centuries-long experiment in low expectations.

Given that this emphasis on democratic decision-making depends on a citizenry educated in experimental intelligence at a wide enough scale, even Dewey's admirers can find him quaintly out of touch after years of professional teaching. However, Dewey urged us to look at the pedagogical situation the other way around: democratic practice is a means, not just an end. We help students recover from maladjustment and alienation, reintegrating them into democratic communities and institutions, by actively and directly engaging with them in open and shared inquiry in an applied context. This in turn redirects our communities and institutions. Far from the pedantry that attends secondhand dispensation of isolated facts, organically assimilated knowledge is an achievement that is more readily retained and put to work. It redirects life.

Conversely, if we wish to sabotage public discourse and inoculate ourselves against democratic planning, adaptive problem-solving, and growth, then we should act as though any well-intentioned and rightly informed person would formulate the problem or event *our* way. This pervasive anti-democratic habit leads us to act as though the real problem is that they do not *get* the problem. In contrast to such ubiquitous moral fundamentalism, Dewey observed that the way we make sense of a problem is inextricably part of that problem. So, he wisely emphasized imaginative democratic intelligence and inquiry over the kind of placeless and faceless rationalistic demonstrations that are endemic to non-experimental moral and political philosophies.

## Deontology

## Synonyms

Moral theory based on duty; Universal moral maxims theory

## Introduction

Deontology is a moral theory developed by Immanuel Kant (1724–1804). Deontology stipulates that what is morally good are moral maxims or moral rules that are capable of being rationally intuited, are universalizable and are true, and, to be followed through duty, are independent of the consequences of following the moral maxims.

## Deontological Theory

Deontology is one of key theoretical moral theories that guide not only traditional Western moral theory but also influence the contemporary discussions and debates in business and professional ethics (see “Virtue Ethics and Utilitarianism” for alternative key moral theories). Immanuel Kant, the father of deontology, was a moral absolutist. He believed that moral maxims or ethical rules were rationally intuited as principled value statements that were recognizable by virtue of the universalizability of such maxims or rules. The most fundamental of these is the maxim that human beings [as moral agents] must always be treated as ends in themselves and never as means to an end. This “universalizability” principle entails that what is morally true as a moral truth is true anywhere, at any time and in any place. This places deontology as at odds with utilitarianism and at odds with any theory which involves some type of moral relativism.

A basic assumption of Kant's moral theory is that human beings are capable of reason and are also free to choose between alternatives. These facts are necessary conditions for moral decision-making. Another basic assumption is that there are two kinds or types of rules. One type of rule is one that I can make for myself but which is not morally required nor does it belong to categorical imperatives as he refers to moral rules. I can decide to abstain from alcohol for health reasons, for example, but that does not require that everyone must abstain from drinking alcohol. This is significantly different from moral laws or rules for which there is a moral duty to follow. As Kant notes:

...[A]n action that is done from duty gets its moral value, not from the object which it is intended to secure, but from the maxim by which it is determined. Accordingly, the action has the same moral value whether the object is attained or not, if only the principle is independent of every object of sensuous desire. (Kant 1995, 47)

Since human beings are capable of free choice, of rational intuition, and of acting from duty, then exercising moral choices, arrived at through ratiocination and done as an act of duty, is behaving in a manner that is moral. These essential abilities

of human beings consequently require that one follows moral maxims and that this is done independent of desires or outcomes. Again, Kant states:

In all cases I must act in such a way that I can at the same time will that my maxim should become a universal law. This is what is meant by conformity to laws pure and simple. ... [Further], the principle, that humanity and every rational nature is an end in itself, is not borrowed from experience. ... because of its universality it applies to all rational beings. ...

## Business Ethics and Deontology

One of the mantras of contemporary business ethics is that business ethics is good for business. This is clearly not what Kant intended when he developed deontology. This approach is premised on the assumption that business exists essentially for the purpose of maximizing profits either for owners or for shareholders. If acting ethically results in greater profits because some consumers care about the ethical standards followed in the production of the goods that they consume, then it makes sense to act ethically. But Kant would argue, as would many other ethical theorists, acting in accordance with a moral maxim only for the economic payoff is not moral behavior. It may be strategic behavior, and it may be a good example of acting in accordance with rational self-interest, but it is not moral action. This approach also implies that if acting ethically does not improve the bottom line financially, then it is justifiable not to act ethically. Kant would argue that such a starting position can certainly never lead to any universalizable principles or laws but only to ad hoc, partial, and perversely self-interested behavior. Kant's approach would argue that, independent of the consequence, one should operate in accordance with fundamental moral principles. Acting in accordance with strategic, rational self-interest is not acting in a manner that makes it possible to universalize my action because it is not possible to universalize individual self-interest. Kant made this argument as a logical argument although some critics have argued that it is an implicit appeal to consequentialism since every

person following their own self-interest would lead to an untenable and unsustainable world.

Underlying all such discussions are at least two questions. (1) What is the purpose of business? (2) Why should we always be moral?

### What Is the Purpose of Business?

Twentieth-century economist Milton Friedman (2005, 18) argued that the purpose of business was to maximize profits for the owners of the corporation or stockholders and obey the law. Anything else, he called "pure and unadulterated socialism." While individual persons are moral agents in their personal lives, as executives in corporations, they are agents for their principals (owners or stockholders) within the limited and constrained understanding of artificial persons which are the corporation. On this latter point Friedman stated:

Only people can have responsibilities. A corporation is an artificial person and in this sense may have artificial responsibilities, but 'business' as a whole cannot be said to have responsibilities, even in this vague sense.

### What Would Kant Say About This?

Independent of what we think about all of Friedman's arguments about the purpose of business (see article on Friedman and social responsibility), it seems plausible (although some may disagree) that he would not accept Friedman's limited notion of the responsibility of artificial persons. While the notion of artificial persons was not addressed by Kant and predates legislation that introduced the notion of artificial personhood which served to limit or mitigate the personal liability of individual owners and stockholders of a company, it seems fair to speculate that he would always hold individuals who own companies to be moral agents responsible for their moral decision-making. Persons do not hang up their moral personhood when they enter the workplace and pick it up again when they leave work.

### Why Should We Always Be Moral?

It is part of the essence of what it means to be human and includes the fundamental moral principle that human beings must always be treated as ends in themselves. Thus, strategic, profit-driven

reasons do not absolve us to dutifully follow the moral maxim. A clear limitation of this theory from an animal rights and environmental ethics perspective is that this categorical imperative does not extend to other sentient beings or to the environment.

## Destructive Leadership

## Definition

Destructive leadership is a broad overarching concept covering a number of different kinds of misbehaviors by managers, supervisors, and leaders in their function and role as a superior and employer representative in the organization. Hence, it has been studied under a range of different terms such as abusive supervision, bullying and harassment, petty tyranny, toxic leadership, dark side of leadership, bad leadership, narcissistic leaders, derailment, incompetent, unethical and poor leadership, to mention but a few. Among these more or less overlapping terms and concepts, “abusive supervision” and “bullying and harassment” are probably the most used concepts in terms of empirical research (see Einarsen et al. 2013). Abusive supervision is defined by Tepper (2000, p. 2000) as “*subordinates’ perception of the extent to which supervisors engage in the sustained display of hostile verbal and non-verbal behaviors, excluding physical contact.*” According to Lutgen-Sandvik et al. (2007) workplace bullying is “*a type of interpersonal aggression at work that goes beyond simple incivility and is marked by the characteristic features of frequency, intensity, duration and power imbalance*” (p. 837). The mentioned concepts are generally restrained to behaviors directed towards subordinates, excluding counterproductive behaviors against the organization itself. However, managers may harm the organization be it directly and indirectly. This may clearly be seen in the not so distant events as the frauds that bankrupted Enron in 2001, in the enormous losses in market capital in many organizations in 2008–2009 in part due to or at least fueled by management decisions (Kaiser and Craig 2014). This said, most empirical studies thus far have been restrained to the superior-subordinate relation (e.g., see Schyns and Schilling 2013).

“Destructive leadership” may therefore be defined as “*the systematic and repeated behaviour by a leader, supervisor or manager that violates the legitimate interest of the organisation by undermining and/or sabotaging the organisation’s goals, tasks, resources, and effectiveness and/or the motivation, well-being or job satisfaction of his/her subordinates*” (Einarsen et al. 2007,

p. 208). The behavior in question must appear systematically, thus excluding single behaviors such as an isolated outburst of anger or a strategic mistake. Hence, a single mistake by a leader is not necessarily indicative of a destructive leadership style. However, if such mistakes become repeated they represent destructive leadership, irrespective of its intentions or causes. Thus, intent on the part of the leader is excluded from the definition as it already excludes accidental behaviors (see Craig and Kaiser (2013) for an alternative view). Furthermore, intent can only be verified by the leader in question, providing him or her with a veto as regards to whether or not destructive leadership has been displayed, contributing to difficulties regarding the handling of such behaviors in the organization, as well as difficulties concerning accountability as regards to legal aspects. Further, it is difficult to decide on the issue of actual intent, as the focal person in practice recall his/her behavior and assess its intention in hindsight (see also Buss 1961). Intent would also create methodological problems as one typically measures it by subordinate ratings employing questionnaires of observed behaviors in one's immediate superior (see also Aasland et al. 2010).

Furthermore, the behavior must be at breach with the legitimate interest of the organization, a typical feature of definitions regarding all forms of counterproductive work behaviors (Gruys and Sackett 2003). By employing the concept of legitimate interest, we narrow what an organization can and cannot expect from its leaders to what must be seen as legitimate behavior in a particular society. By legitimate we refer to what can be considered as legal, reasonable, and justifiable for a given organization in a given cultural context. Hence, what is perceived as destructive behavior may in principle vary between cultures and societies over time, and to some extent between organizations, depending on their legitimate mission in a given society. For instance, in times of war, risking an officer's life can probably not be seen as destructive, while doing so in times of peace and training would. Bullying and harassment of subordinates would also in most countries be against the legitimate interest of the employer due to the employers duty of care towards subordinates,

in some countries with an explicit ban of such behaviors at work (see Yamada 2011).

The said definition further includes behaviors that are verbal or physical, direct or indirect, as well as active or passive, corresponding to the three dichotomous dimensions presented by Buss (1961) in his description of aggressive behaviors. Hence, the definition includes active as well as passive behaviors, based on the argument that one "cannot not behave" in a leader position (see also Skogstad et al. 2007; Barling and Frone 2016). Hence, destructive leadership behaviors come in many shapes and forms with behaviors being directed towards subordinates, the organization, or both, being more or less active and direct, with a variety of antecedents on both an individual, an organizational, and a societal level, yet with clearly documented negative outcomes to its targets (see Einarsen et al. 2013). Hence, different parts of the concept have been in focus and have been studied over time, as will be further elaborated below.

## Description

Tales of destructive and abusive behaviors by figures in power are abundant throughout history as well as in folk tales, the fictional literature, as well as in contemporary movies and television series. Written texts of a scholarly nature even exist where leaders are advised to or described how to use their power aggressively towards their subordinates, for example, in *The book of Lord Shang* (written in China ca. 300 B.C.), in *Arthashastra* (written in India ca. 300 B.C), in *The Prince*, written by Machiavelli in the sixteenth century in today's Italy. Hence, destructive leadership is nothing new to man and something that may even be valued, at least from the viewpoint of the ruler. Yet, these early texts often addresses political leaders and often in the context of military or political strategies.

The academic study of destructive leadership in organizations and working life, however, gained ground in the aftermath of World War II. As the world learned of the horrors ravaged upon the Jews specifically and inhabitants in Europe and

Asia in general, in particular by representatives and employees of the Third Reich, the interest grew on the issue of what made people behave in such abusive and aggressive manners (Altemeyer 1998). Psychoanalyst Erich Fromm (1941) had already given an answer, by arguing that the Nazi regime arose from a sickness in the German people. The powerful, dominant leaders and the vast crowd of faithful followers allegedly manifested the two faces of the sadistic-masochistic personality. This one illness, however, drove both groups, locking them into a dominance-submissive authoritarian embrace (see Altemeyer 1998). This explanation and psychoanalytic theory in general helped outline the famous “Berkeley” research program on authoritarianism (Adorno et al. 1950), which saw the authoritarian personality as both submissive and dominate depended on whether one was interacting with superiors or subordinates.

Studies followed that looked more into the submissive than the dominant aspect of this, such as The 1971 Stanford Prison experiment (Zimbardo 2008), and even more so Milgram’s experimental study of obedience to authority (Milgram 1963, 1965) showing that most people under specific situational conditions, and given the opportunity and pressure from superiors, are capable of behaving rather destructively towards others. Still, it was, with a few exceptions, not until the early 1980s that explicit and systematic studies on the dominant rather than the submissive form of destructive leadership reappeared in the research literature, yet again mainly within a personality approach. In 1976, an American psychiatrist, Carroll M. Brodsky published the seminal book *The Harassed Worker*, calling attention to the systematic mistreatment and emotional abuse of employees by their superiors and colleagues. After analyzing some 1000 cases where employees had been injured, mistreated, or crippled while at work, Brodsky showed that such mistreatment was often done by psychological rather than physical means, involving subtle and discrete actions, yet with traumatic and devastating outcomes for exposed subordinates. Kets de Vries and Miller (1985) represents an early pioneer within a “bad man” approach, with his important work on destructive leadership from a psychoanalytic perspective, focusing on

leaders with narcissistic personalities. Also, researchers such as McCall and Lombardo (1983) at the Center for Creative Leadership, contributed to the field by their qualitative studies of “intolerable bosses” and leaders who derailed (Lombardo and McCall 1984). Additionally, studies on “the dark side of leadership” (Howell 1988; Conger 1990; Hogan et al. 1990) documented that some charismatic leaders focus on personal gain rather than the common good of the organization and its subordinates. A parallel tradition within political psychology has investigated, analyzed, and profiled tyrants and despots, such as Hitler, Stalin, and Saddam Hussein, using historical and biographical data (e.g., O’Connor et al. 1996).

Yet, until the turn of the last millennium, the empirical study of destructive as opposed to constructive and effective forms of leadership was sparse within the area of business and working life, which at least partly may be explained by the fact that leadership traditionally has been defined as an equivalent to effective leadership. However, after the millennium, empirical research has flourished with a shift in perspective from the personality to the mere behavior of the said leader employing terms such as abusive supervision and workplace bullying by leaders (Skogstad et al. 2017), yet with a heavy focus on documenting its detrimental outcomes (Mackey et al. 2015; Montano et al. 2016; Schyns and Schilling 2013; Zhang and Liao 2015). Furthermore, calls have been out to expand the focus to include both the social and organizational environment as well as the followers of the said leader in the analysis of what constitutes destructive leadership (Kant et al. 2013; Martinko et al. 2013; Thoroughgood et al. 2016; Padilla et al. 2007).

### **A Model of Destructive and Constructive Leadership Behavior**

In accordance with the above presented overarching definition of destructive leadership, the Destructive and Constructive Leadership Behaviour model (DCLB) model (Einarsen et al. 2007) has been proposed employing the two very basic dimensions in studies of leader and group

**Destructive Leadership,****Fig. 1** The destructive-constructive leadership behavior model (Einarsen et al. 2007)

D

behavior: subordinate- and organization-oriented behaviors, two dimensions that are seen as independent behavioral categories (see Fig. 1).

The subordinate oriented dimension describes leadership behaviors ranging from antisubordinate behaviors to pro-subordinate behaviors. Anti-subordinate behaviors violate the legitimate interest of the organization by undermining or harming the motivation, well-being, or job satisfaction of subordinates, and may involve behaviors like bullying, harassment, or other kinds of incivility and mistreatment of subordinates. Pro-subordinate behaviors, on the other hand, are behaviors that foster the motivation, well-being, and job satisfaction of subordinates, including taking care of and supporting subordinates (e.g., listening to subordinates, attending to social relations among subordinates, giving praise when due, and showing appreciation and respect). The second dimension describes organization-oriented behaviors, ranging from antiorganization behaviors to pro-organization behaviors. Antiorganizational behaviors violate the legitimate interest of the organization and include such things as stealing from the organization (be it material, money or time), working towards goals that are in opposition to those of the organization, sabotaging the goal attainment of the organization, or being involved in other forms of corruption or crimes. Pro-organizational behaviors involve working towards the fulfilment

of the organization's goals, setting clear and unambiguous objectives, making or supporting strategic decisions, and implementing organizational change, among other things. Furthermore, leaders' behaviors may be described as more or less constructive (pro-behaviors) and more or less destructive (antibehaviors) on each of the two dimensions. By cross-cutting the two dimensions, the model presents four categories of leadership behaviors, three of which are destructive: (1) Tyrannical Leadership Behavior (pro-organizational-oriented behavior coupled with antisubordinate behavior), (2) Derailed Leadership Behavior (antiorganizational behavior as well as anti-subordinate behavior), and Supportive-Disloyal Leadership Behavior (pro-subordinate behavior, while simultaneously displaying antiorganizational behavior). Thus, the model presents a nuanced picture of the phenomenon of destructive leadership and how it relates to a broad basic concept of constructive forms of leadership. For a more detailed description of the four concepts of leadership behaviors see Table 1.

The presented model does not explicitly define passive and avoidant forms of leadership, such as laissez-faire leadership, which is included in some general models of leadership (e.g., Bass and Avolio 1990a, b; Blake and Mouton 1985) and in works on destructive forms of leadership (e.g., Kelloway et al. 2005; Thoroughgood et al. 2012).

| Tyrannical leadership behaviors | Displaying pro-organizational behaviors combined with antisubordinate behaviors. The said leader may behave in accordance with the legitimate goals, tasks, and strategies of the organization, yet typically obtain results not through, but at the expense of, subordinates. Tyrannical leaders bully, humiliate and manipulate their subordinates in order to “get the job done.” What senior management may perceive as a strong focus on task completion may on the other be perceived by subordinates as abusive leadership. They may still be superior strategists or high performing leaders in terms of technical skills or in terms of task-related efficiency                                                                                                                                                                                                       |
| Derailed leadership behaviors   | Displaying both antiorganizational and antisubordinate behaviors. Such leaders may bully, humiliate, manipulate, or deceive while simultaneously or in parallel engaging in antiorganizational behavior such as illegitimate absenteeism, fraud, or otherwise stealing resources from the organization. These leaders may use their charismatic qualities for personal gain at the expense of both subordinates and the organization                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Supportive-disloyal leadership  | Displaying pro-subordinate behaviors combined with antiorganizational behaviors. Such leaders motivate and support their subordinates while simultaneously stealing resources from the organization, be they materials, time, or financial resources. Supportive-disloyal leaders may provide employees with benefits they are entitled to at the expense of the organization, encourage a poor work ethic and misconduct, or cause their subordinates to be inefficient, all the while behaving in a comradely and supportive manner. The intention of the supportive-disloyal leader may not necessarily be to harm the organization; he or she may simply be acting upon a different “vision” or strategy working in support of other values or goals than that of the organization, even believing that he or she acts with the organisation’s best interest at heart      |
| Constructive leadership         | Displaying pro-organizational as well as pro-subordinate behaviors, acting in accordance with the legitimate interests of the organization, supporting and working towards the strategy of the organization, while simultaneously motivating and supporting their followers through considerate behaviors, inspiration, and the involvement and participation in decision processes. Hence, constructive leadership reflects both transformational and transactional forms of leadership as described in the “Full Range Leadership Model” (see Bass and Riggio 2006), and may be seen as a parallel to the “high-high” leader, and what is called “Team Management” in Blake and Mouton’s Managerial Grid (1985). In essence: supporting and motivating subordinates while focusing on the optimal use of organizational resources to achieve legitimate organizational goals |
| Laissez-faire leadership        | The leader has been nominated and does exist physically in the leadership position, but has in practice abdicated from the responsibilities and duties designated to him/her, hence exerting a minimum of effort to get required work done combined with a minimum of concern for subordinates. Laissez-faire leaders do not intervene until problems are either firmly brought to their attention or the problems become so serious that action is demanded and can no longer be avoided given the responsibilities associated with their position. The lack of imitative may also be perceived as a form of social exclusion by the subordinates                                                                                                                                                                                                                             |

Blake and Mouton describe “impoverished management” as a form of leadership where the leader is exerting a minimal amount of effort to get required work done combined with displaying a minimal concern for subordinates. This type of leadership behavior has several characteristics in common with both “laissez-faire leadership” and “passive management” (Bass with Bass 2008). Leaders engaging in the passive

style “management-by-exception” only intervene when problems are either brought to their attention or become impossible to ignore, while leaders displaying laissez-faire leadership neither initiate leadership nor respond to follower or organizational needs by avoiding decision-making and the responsibilities associated with their position (Bass and Riggio 2006). Intuitively one might situate laissez-faire in the middle of the model as

the proposed model may be thought of as an extension of the Blake and Mouton's (1985) Managerial Grid (see Aasland et al. 2010). However, Stogdill (1974) points out that comparing laissez-faire leadership to nonleadership is a severe mistake. The appointment to a leadership role evokes legitimate expectations among subordinates and superiors that, when left unfulfilled, have a range of negative consequences for subordinates as well as the organization. Its destructiveness is further substantiated by the operational definition in Bass and Avolio's extensively used MLQ-measure with items mirroring not being present when needed, and avoiding involvement in important and urgent questions and issues (Bass and Avolio 1994). Accordingly, laissez-faire leadership have been documented to be negatively related to subordinate's job satisfaction and organizational commitment, positively related to subordinate health outcomes (Skogstad et al. 2017), as well as negatively related to leader effectiveness (Derue et al. 2011; Judge and Piccolo 2004). As laissez-faire leadership has the potential to undermine organizational objectives as well as subordinates' well-being, it may be classified as both anti-subordinate and antiorganizational, and thus best be defined as a passive form of derailed leadership in the above model.

## Prevalence

Research and informed estimates claim destructive behaviors by managers and leaders to be relatively prevalent in contemporary working life, especially when including both severe and less severe forms, indirect as well as direct behaviors, behaviors directed at subordinates as well as conduct afflicting the organization itself, (e.g., Aasland et al. 2010). Organizational climate research conducted between the 1950s and the 1990s, showed that 60–75% of all employees typically report that the worst aspect of their job is their immediate supervisor (Hogan et al. 1990). An American study revealed that some 13.5% of all workers were severely affected by an abusive supervisor at any given time (Schat et al. 2006), while an English study showed 40% of public

sector workers to have experienced bullying from a leader during their working career (UNISON 1997). Furthermore, some 5–10% of employees in Europe are subjected to systematic and on-going bullying at any given time (Zapf et al. 2011), with 50–80% of all cases involving a superior in the role of the alleged bully (Einarsen et al. 2011). A representative study of Norwegian subordinates observations of systematic destructive leadership in one's immediate superior showed that 60% of all employees had such observations over the last 6 months, with laissez-faire leadership as the by far most prevalent kind (Aasland et al. 2010). Hence, destructive leadership is not an anomaly in today's organizations and contemporary working life.

## Closing Comments on Expanding the Focus Beyond the Individual Leader

A leader may behave destructively for a number of reasons (see e.g., Martinko et al. 2013). Meta-studies show that predictors of destructive forms of leadership include factors such as negative affectivity, perceived interactional injustice, perceived stressors and exhaustion, deviant subordinate behaviors, and aggressive norms in the organizational climate (Mackey et al. 2015; Zhang and Bednall 2016). However, behavior is always a result of a complex interplay between a wide range of internal and external factors, as well as being embedded in the particular situation and context where it arises. Hence, calls have been made to expand the focus beyond that of the individual leader encompassing subordinates as well as the immediate environment of the superior and his or her subordinates (see). The concept of the "toxic triangle" has been introduced to describe such a broader perspective including both subordinates and the broader environment of the organization, with destructive leadership being seen as *"a complex process of influence between flawed, toxic, or ineffective leaders, susceptible followers, and conducive environments, which unfolds over time and, on balance, culminates in destructive group or organizational outcomes that compromise the quality of life for*

*internal and external constituents and detract from their group-focused goals or purposes”* (Thoroughgood et al. 2016). Destructive behaviors are then socially embedded and shaped in a transaction between person and environment, featuring leader-member and group processes, organizational and societal factors, and a dynamic timeframe. Yet, from a legal and a moral perspective, a given leader is always responsible for his or her actions and decisions, irrespective of any social influence they may have encountered, an important principle governing the Nuremberg trial against Nazi-leaders after the World War II. Leaders are always responsible for their own behaviors, irrespective of its potential causes and determinants. In some cases leaders are even legally and ethically responsible for the conduct of their subordinates due to their overarching responsibility and their general duty of care.

## Introduction

Development is the field of practice focused on the improvement of human lives, with particular attention to the poorest countries, communities, and individuals. It is concerned with economic advancement, quality and length of life, and access to resources and opportunities. The contemporary era of development is widely viewed as starting with the post-World War II Marshall Plan for the rebuilding of Europe.

The field of professional ethics relating to development practice is known as development ethics and originated with the work of Denis

Goulet in 1971. The concept of human development and the capabilities approach are part of a broader evolution of development theory and practice that grow from and further inform development ethics.

## People-Centered Practice

Described by Des Gasper (2012) as “an interdisciplinary meeting ground,” development ethics is viewed by its proponents as a dynamic site of engagement by actors bringing diverse intellectual, cultural, and practical perspectives. Of critical importance is the translation of any such engagement into action, specifically action that prioritizes those sidelined by traditional models of progress. In particular, it recognizes that there are significant costs involved in social change and that attention must be given to “determining tolerable levels of human suffering” in seeking such change (Goulet 1997).

Development ethics is, first and foremost, people centered, meaning that development should be oriented to enabling people to be “fully human,” expressing the varied dimensions of fulfilling life, as defined by the individuals and communities concerned rather than external agents (Gasper and St. Clair 2010). Pointing to the insufficiency of economic approaches in prioritizing (and thus achieving) the outcomes and values of the people at whom development is targeted, development ethics highlights the need to understand that people are much more than economic units. Going well beyond this, development ethics focuses on the expansion of choice that enables even the most marginalized people to flourish.

Measuring progress in solely economic terms, development has long been viewed by governments as an effective tool for gaining political support of populations – from its origins in the Marshall Plan, grounded in the Truman Doctrine’s aim of impeding the spread of Communism, through development as diplomacy, to the allocation of development funding to population-centric military strategies that identify development-like projects as tools for gaining popular support.

In contrast to this, development ethics refers to development as “the means of the means,” placing emphasis on the processes of development, specifically that they be participatory and focused on human flourishing, particularly enabling individuals and communities to realize those *ends that they have reason to value*. Thus, while the outcomes, or ends, retain importance, the methods employed are afforded significantly more importance than just as a strategy for meeting valuable goals. Rather, they bear value in a transaction that is often highly costly for the “recipients,” and this is one reason development as diplomacy or political strategy is judged harshly. Similarly, these processes are often key in ensuring development meets the actual needs and aspirations of those it targets, and this can be lost when development is externally designed and managed.

Connected with this, development ethics is concerned with the function of power within both communities and development processes, leading to its central concern, namely, the question: “How can moral guidelines influence decisions of those who hold power?” (Goulet 1971). In this sense, there is a pragmatic focus on influencing the influencers, as the most effective pathway to broad impact. This refers to both policy makers in funding and recipient countries and leaders at a range of levels, who can determine who is included and whose needs are prioritized.

Focus on processes and power leads to development approaches centered on community engagement in design, management, delivery, and evaluation of development. Participatory processes, for example, engage communities in these aspects of their own development, while also drawing on people with low power and influence, thus disrupting power structures that function to exclude individuals and groups.

While development ethics appears closely connected with human rights and its basis in the claim that all people are free and equal in dignity and worth, development ethicists view human rights as necessary but insufficient. This is because not all values can be thought of in terms of rights and because the language of rights can be inaccessible to marginalized people.

## Practical Application

Development ethics is inherently practical, rejecting ethical reflection that is not realized in public practice. As such, the ideas of development ethics are often expressed in terms of practice – how the centrality of human flourishing can be emphasized in development processes that engage and enable the poorest and most excluded.

Part of a wave of concern about economic, modernist values for development, the capability approach of Nobel prize-winning economist Amartya Sen epitomizes the interdisciplinary nature of development ethics (Sen 2001). Reflecting the centrality of human flourishing in development ethics, the capability approach prioritizes people's genuine capacity and opportunity to achieve – their ability to do and to be the things they have reason to value themselves, not just growth in gross national product (GNP). Philosopher Martha Nussbaum extends Sen's focus on freedom to achieve these factors with an articulation of humans as fundamentally social and possessing dignity and moral worth. The capability approach has become a core organizational approach within development ethics.

Demonstrating the rapid translation of ideas into practical action, the capability approach was expanded by another economist, Mahbub Ul Haq, into the concept of human development. This is another tangible expression of development ethics, created by and launched with the first *Human Development Report* of the United Nations Development Project (UNDP) in 1990. It rejects the economic focus on measuring development through a nation's gross national product (GNP) alone, embracing measures of quality of life for citizens (specifically a decent standard of living, long and healthy life, and knowledge, as measured through education). The human development approach has fundamentally changed the way development is measured and in turn the kinds of processes and goals that are valued in development practice.

The key body of development ethics is the International Development Ethics Association (IDEA), which serves as a node for ethical discussion, solidarity, and improvement. Initiated in

1984, it is deliberately interdisciplinary and hosts a biennial academic conference.

## Dialectical Enquiry in Ethical Business Dispute Resolution

## Definition

The dialectical approach to dispute resolution requires that parties to a dispute recognize that there are various valid ways to view the situation. Varied viewpoints must be identified and understood, to expose the assumptions that underlie them. Discussions will increase understanding and may lead to all parties coming to share a common understanding in the disputed area. Agreement on how best to take actions may then emerge.

## Background

In life generally, and particularly in business situations, there occur disagreements between groups of people concerning the best way to proceed from situations which develop. Disagreements may be solved quickly where one party is far more powerful than the others, but this may involve unethical behavior from the strongest party, and cause long-term resentment from the weaker parties. In other situations the parties involved may hold approximately equal power and moving on may be difficult. In all societies, over time, techniques have been developed to aid dispute resolution.

In many societies, debate is employed to help antagonists to decide on the best way to proceed when a dispute arises. A debate generally involves the antagonists becoming involved in a contest of logic, which involves each party attempting to prove their ideas are more logical than those of the other parties. The debate may come to focus on showing that the other antagonists are foolish; their ideas deserve only to be dismissed with laughter. Debates are overtly confrontational, with winners and losers. Furthermore, antagonists are often expected to compromise so that life can proceed. Often, agreed compromises result in all those involved adopting a way forward, which no one in particular is happy with. This is not a good way to resolve disputes.

Interchanges with other people/groups with whom one does not agree can be positive experiences. Education can result from listening to the

opinions of others and to their justifications for holding those opinions. Thoughtful interchanges may allow one to develop one's understanding; dialogues can alert antagonists to inner contradictions which exist within many areas of our thinking. Interchanges may allow the identification of "hidden" assumptions, whether they underpin the opinions of others or one's own. Identifying assumptions which have previously been taken as "givens" or common sense may aid in dispute resolution, as they may be found to differ from the assumptions of others – and thus require a reconsideration of what constitutes "common sense."

## History

In Ancient Greece, Zeno (c. 490–425 BC) suggested a way to help individuals gain understanding of the world, and antagonists to address disagreements in understandings; he called it "dialectics" (art of discussion). Plato made use of the technique and thereby promoted it. Dialectics recognize that to obtain a "proper" knowledge of anything requires the seeker of truth to contemplate its opposite. Thus, a knowledge of what is "bad" is required, in order to know what is "good." One must know what is dead in order to know what is alive, and so on.

In business, a dialectical approach can allow a better understanding of an ill-structured problem to emerge. Choosing to view situations from different perspectives, and then combining the various insights obtained, allows for a more informed understanding of a situation. States of affairs do not arise in a vacuum, but often under tensions from competing forces. Age may be understood as a balance between young and old; wealth may be understood as a balance between rich and poor.

The term "dialectic" has been used to refer to a number of somewhat different approaches to discourse. However, it has always been related, to some extent, to a search for truth and understanding. Dialectic is claimed to promote rational discussion. Medieval universities delivered "Classical Education" through the "Trivium" (where three roads meet). The Trivium consists of: Grammar, Logic (or Dialectic), and

Rhetoric. Here dialectic involved students entering in to discourse with their instructors in order to help them gain comprehension of how facts fit together, and thereby gain an understanding of their world.

Kant (1724–1794) made use of dialectic reasoning. Hegel (1770–1831) encouraged its development in its contemporary form. Marx (1818–1883) developed his dialectical materialism from Hegel's base. In organizational research, Mason and Mitroff have been active in the promotion of Hegel's dialectic technique to resolve disagreements in organizations in the United States in the twentieth century (see: Mason and Mitroff 1981; Mitroff and Mason 1981). Their publications provide many examples where they claim that dialectical enquiry has been used to good effect in resolving disagreements within organizations.

### Employing Dialectical Enquiry in Dispute Resolution

The first step in addressing an emergent disagreement is to realize that there is a disagreement, that is, to feel that something is "wrong." At this stage no specific disagreement is defined, rather it is vaguely recognized that there is something deemed wrong. Even at this stage errors can occur. One may feel there is a disagreement, when there is not.

If a disagreement is present, then the problem must be properly defined. Here there are possibilities for wasteful misunderstandings. Ackoff (1969) provides an example concerning lifts in a high building. When a large new multistorey office block was opened, its many resident employees complained of inadequate lifts at peak times. The engineers were consulted and, over considerable time, provided several suggestions on how the problem might be ameliorated. However, after all such suggestions had been "successfully" implemented, the complaints continued. At that point, a nonengineer with some training in psychology suggested that the complaints may reduce if those waiting for lifts were

provided with some form of amusement. Large mirrors were installed around the walls of the large crush-hall where employees awaited the arrival of the lifts. The complaints ceased.

This story illustrates how experts from different disciplines view problems in different ways. Engineers are trained to look for technical problems, and tend to propose technical solutions. Psychologists, on the other hand, are trained to view problems in human terms. They tend towards people-oriented solutions. Problems are not natural creations, but human creations. Problems are conceptualized as such by the people involved. Different analysts often can, and do, conceptualize problems in different ways, and therefore they may suggest different ways to address them. Discussing available options is good practice, before a way forward is chosen.

If a disagreement is present, then Hegel's dialectical enquiry technique requires that one group provides an account of what they believe to be the best way forward, and why; this is termed the "thesis." A second group must provide its alternative view of the best way to proceed, and explain why; this is termed the "antithesis." The antagonists are then required to discuss the thesis and antithesis.

First, one group, the thesis group, is given the floor. This group describes the main action it wishes to promote, and explains why. The other group, the antithesis group, responds (in a logically related manner) to what the thesis group has said. The response of the antithesis group should contain counterarguments to the thesis case; it must not just acknowledge that the thesis case has been heard and then provide the antithesis case simply on the assumption that it is better.

The thesis case includes an explanation of the thesis group's chosen way of perceiving the problem. This way of perceiving may be questioned by the antithesis group. The thesis group listens to comments from the antithesis group, and then takes the floor and responds to each of these comments. In turn, the antithesis group is given the floor and responds to the latest comments from the thesis group. The discussion goes from side to side like a ball on a ping-pong table.

Those who see value in the dialectic enquiry believe that a discussion such as described above will enable all participants to gain in knowledge. Participants who present a listening ear will be educated. As the discussion swings from thesis to antithesis and back again, it is hoped there will be a coming together in how the antagonists view the situation.

After some time, it is probable that the pace of any further coming-together will slow to a halt. At that point the antithesis group can be invited to take the floor and present its own way of perceiving the problem, and what the best remedy may be. The thesis group then takes the floor and responds to the fresh arguments that the antithesis group has introduced. In turn, the antithesis group responds to the comments of the thesis group, and the process continues. The process allows ongoing mutual education. It is hoped that it will result in a continuing coming-together, among all present, concerning the best way to proceed.

After possibly a considerable time, it is hoped that all present will come to appreciate that there is more than one way to view the initial situation, and perhaps more things to consider than originally realized. Hopefully, a mutually agreed best way of responding to the situation will have emerged, now that everyone has a better understanding of the situation. This mutually agreed best way is referred to as the “synthesis.” The purpose of conducting a dialectical enquiry is to find a synthesis.

Note that those who choose to participate in the dialectical enquiry do not go to the enquiry dominated by a wish to prove their thinking is correct. They participate in the hope that they will learn something from their participation and listening. They also expect to educate their antagonists about their own perspective on the situation, and how best to address it. Both groups of antagonists are hoping not to win the enquiry but rather to use it to raise everyone’s understanding of the situation and encourage the best possible response to emerge. A good synthesis provides a better solution to a dispute than either side thought possible before the enquiry.

## Criticisms of the Dialectical Enquiry Technique

Many people who have employed the dialectical enquiry technique and found it helpful in resolving organizational disputes wonder, nevertheless, if the time and effort involved are worth the results obtained. If the dialectical enquiry is to be undertaken properly, a lot of time must generally be made available by all concerned to allow for a synthesis to emerge. If the enquiry can be terminated at any time, and the time limit is set in advance, then it is possible that a synthesis will not emerge. Still, all participants should be able to leave the meeting with an enhanced understanding of the problem areas, provided that a reasonable time limit was set for the enquiries and that they were well conducted. Benefits which are considered worthwhile on a value for time-committed basis may result. For example, an enquiry concerning whether a business should pollute a river in order to provide local employment and increase corporate profits may not lead to a synthesis after many days of argument. However, those opposing the pollution may have learned that the benefits from some limited pollution may be worth accepting; the promoters may have come to appreciate that there are good environmental reasons to keep any pollution to a minimum for reasons that they had previously not properly understood. Such a dialectic enquiry could facilitate tolerant future discussions on emerging options, despite a synthesis not having emerged during the enquiry.

Not all prominent philosophers have considered the dialectical approach to promoting understanding to be a good one. For example, Karl Popper (1902–1994) believed in: individuality, open criticism, and humanitarianism, which had evolved within the twentieth century European “free” societies. He believed that under tribalism humans had been willing to subjugate their lives to prescribed rules created by others. He thought that dialectical enquiry could persuade individuals to accept contradictions because it initiates irrationalism; he feared it could be used to persuade the “freed” individuals of Europe to accept again societal shackles created by others. He believed it

helped the rise of fascism in Europe (Popper 1945).

## Differences Between Transactional and Transformational Leadership

## Introduction

Transactional and transformational leadership are two of the most well-known and widely researched areas of leadership (Bass 1990; DuBrin 2015; Humphrey 2013; Rafferty and Griffin 2004). Burns (1978) is the scholar who coined the terms transactional and transformational leadership. He termed transactional

leadership as being exchange oriented, in that it is based wholly on exchanges. Essentially, a follower does the bidding of his or her transactional leader because he or she is promised something in exchange. It usually tends to be a reward-based exchange or reward-based transaction. Hence, Burns coined the term transactional leadership. In contrast to this form of leadership, transformational leadership does not explicitly require the presence of any sort of reward. Instead, it involves the leader inspiring his or her followers and making them more moral in the process. The interaction between a transformational leader and followers tends to be transformative for both the leader and the followers (Northouse 2021).

Bass (1985) further refined the original definition of transformational leadership by including the followers' perspective in the model and by suggesting that transformational leadership could sometimes be linked with undesirable outcomes. He essentially treated transactional and transformational leadership on a continuum, with transactional leadership being in the middle, while transformational leadership and laissez-faire leadership were on opposite ends. As one can expect, laissez-faire leadership is a form of leadership where there are no transactions nor is there any possibility of transformation. In short, it is completely different from either transactional or transformational leadership.

## How Do Transactional Leadership and Transformational Leadership Differ?

Apart from their different definitions, there are other ways by which one can differentiate between transactional and transformational leadership (Northouse 2021). One way to do so is to examine both leadership styles in terms of their factors. Transformational leadership comprises the famous 4-I factor model, which includes the 4-Is of Idealized Influence, Inspirational Motivation, Intellectual Stimulation, and Individualized Consideration. These 4-I factors are very distinct from the factors found in transactional leadership. Idealized Influence has to do with charisma – essentially transformational leaders tend to be

charismatic. By dint of their charisma alone, they are able to influence their followers. Idealized influence means that followers consider these transformational leaders as idealized individuals, who they could follow and strive to be like.

Similarly, Inspirational Motivation has to do with how motivating transformational leaders are. They are able to communicate with clarity and use motivating language while communicating their vision for the organization. Motivating language is something that tends to inspire individuals a lot (Elsner Twesme et al 2021; Rabiul and Yean 2021; Sarros et al. 2014), and transformational leaders use motivating language abundantly. Intellectual Stimulation has to do with creativity and innovation, and transformational leaders tend to inspire their followers to try innovative and novel approaches to solving problems. This is something transactional leaders never do, as they usually focus on sticking to tried and tested methods, which may not work as optimally as one may like, and also do not positively impact follower creativity.

Individualized Consideration is another factor that emphatically contrasts between transformational and transactional leaders. This factor emphasizes consideration and care for followers, which is uniquely tailored to each individual follower. Transactional leaders do not usually adhere to any sort of tailoring of consideration to their followers. The 4-I factors make it clear why transformational leadership has been linked with so many beneficial and positive outcomes.

In contrast to transformational leadership, transactional leadership has different factors (Northouse 2021). The big overarching factor is that transactional leadership is based on transactions, which often include rewards for followers and subordinates. Northouse (2021) discusses two factors that specifically apply to transactional leadership. One factor is contingent reward – this factor refers to the contingent reward that followers can obtain after they perform or accomplish a particular task set out by their leader. This style of leadership usually works well especially if the reward and performance parameters are well defined. However, the link between performance

and reward is implicit here – without the contingent reward, the transactional leader would not be able to get the follower to comply or perform. There is no inspiration process here, nor is there any motivation, if one eliminates the contingent reward.

The other factor pertinent to transactional leadership is Management-by-Exception where leaders use corrective action procedures, including criticism and negative reinforcement, in order to obtain compliance by their followers. Any rule violation by followers results in a strict and quick correction by the transactional leader. This factor can be either active or passive – passive forms of Management-by-Exception include situations where leaders punish their rule violating employees, but do so only after standards have not been met (Northouse 2021). Active forms of Management-by-Exception by contrast are much more feedback-oriented, in that the leader actively watches, and if there is a high probability that standards are going to be unmet or rules are going to be violated, then the leader steps in. This Management-by-Exception factor contrasts with contingent rewards in that the latter is focused on positive reinforcement, while the former is focused on negative reinforcement.

Transformational leadership on the other hand is not so much focused on rewards or punishments, but more so on follower organic growth. Research has found that transformational leadership results in performance and outcomes that go well above and beyond what is expected. Transactional leadership only results in outcomes that could be classified as being rather ordinary. Sometimes, transformational leaders do need to use transactional leadership tactics, but transactional leaders usually never use transformational leadership tactics.

## Digital Convergence and Musical Ethics

## Introduction

Through the efforts of groups such as UNESCO's *Ad Hoc Expert Group on Endangered Languages*, we realize that half the world's languages will become extinct within the next half century. While music is not a language per se, we can extrapolate: a large part of music's local idioms – its styles and genres, modes of performance, ritual

functions, and other aspects of identity – will similarly become extinct in that time frame, if not earlier. The factors responsible for a language's demise are many, but in the case of music, the principal factor is what we call here *digital convergence*. The term is often used in a positive sense to mean the coordination, if not the standardization, of digital tools. We use the term in a markedly different sense: *digital convergence* means here the replacement of the many and diverse nondigital forms of musical expression with a small number, indeed a canon, of digital forms. Our usage is conceived in terms of ratio: before digital convergence, the world's musics were large in number and kind, and no particular repertoire was weighted in frequency more than any other. In the new world of digital convergence, a small, canonic digital repertoire has emerged, a repertoire that far outweighs its nondigital ancestor in frequency of performance or reproduction. The ratio has become extreme, to the point of compromising the existence of nondigital forms of musical expression, and this has ramifications of an ethical nature.

Digital convergence has geographical implications: local traditions of expression limited in number and rooted in locale are replaced by global digital forms that allow for mass reproduction around the world regardless of location. In ethical terms, locale gives way to geographical anonymity. Digital convergence also has implications in terms of quality. By *quality* we mean here the means of distinction in terms of style and ultimately in terms of the material of musical production (for example, the instruments involved, the space of musical production). The sheer number of nondigital musical idioms arises from the number of contexts necessary to create and sustain such idioms (contexts largely dependent on thriving musical locales). Convergent digital idioms, on the other hand, are markedly fewer because, being digital, they traverse (if not transcend) locales; digital creation and reproduction does not materially depend upon locale. Convergent digital idioms are also canonic and thus limited by both number and the criteria necessary for entry into the canon. In ethical terms, the qualitative breadth of human musical expression is thus severely constrained.

## Global and Mass Digital Reproduction of Music

Global distribution and merchandizing are largely responsible for digital musical convergence. The principal music distributors in a digital world (such as iTunes, Spotify, Apple Music, Google Play) sell a small canon of musical works in massive numbers. Thus, for example, Michael Jackson's *Thriller* has sold more than 100 million copies worldwide. By contrast, it is likely that the number of performances, let alone recordings, accorded a whole corpus of an historical repertoire – Beethoven's much vaunted string quartets, or the early recordings of Louis Armstrong, for example – is but a small fraction of 100 million. By the sheer number of recordings sold, human listening converges on this new digital canon and on the products of the principal music distributors, much as human language converges upon modern English.

Let us say then that on the largest level – the digital reproduction of music at the hands of multinationals such as Apple – the wealth of music is being converted so as to exchange a great diversity in musical quality for uniformity in mass reproduction. The great breadth of local musical tradition is being replaced with a markedly smaller digital canon of mass reproduced musical works that have no necessary relationship to locale or tradition. The production of music in the future, unfortunately, will not diverge from this tendency toward convergence, unless some radical development in the material nature of the musical work and its reproduction arises in opposition.

## Musical Impoverishment

To return to ethics, digital musical convergence is unfortunate: a richness in the variety of human experience and expression is, at the least, a necessity to the quality of human life. Much as the extinction of languages removes from human expression a wealth of individual thought, so too the demise of small and local nondigital musical idioms removes a wealth of individual musical expression. Consider, for example, a local

tradition that has produced a musical repertoire linked to the special acoustic qualities of its given locale, qualities that cannot be mass reproduced digitally (say, for example, the Alphorn in Switzerland, or the marching band in American college football, both dependent on the spatial distinction between music indoors and outdoors, a distinction impossible to capture digitally). The musical expression of that environment will be lost, if its participants come to prefer mass reproduced digital music. Further by way of example, we can think of Inuit throat singing, the local parish church bell, the street corner Salvation Army Band, and the lullaby sung in the nursery – each of which lies in danger of extinction by a preference for digital musical forms.

The ethical consequences are considerable. Digital musical convergence entails a loss of the means for expressing individual emotional states, or the loss of idioms for expressing regional identities. Music is thus transformed from a longstanding vehicle for the local expression and affirmation of the individual into a vehicle of conformity to canon.

While global media are in large part to blame, the constant gravitation of the world's population to large and cosmopolitan cities, marked by the demise of rural village traditions, is a major contributor to digital musical convergence, as it is with regard to language. In a sense, the listeners of the world are quitting their local situations and moving to the city, which consequently grows ever larger. Encountering a multitude of musical dialects there, these modern listeners have sought out only those idioms common to the greatest number of their new neighbors – a musical lingua franca – and abandoned their specialized idioms. Their children, embarrassed by the raw forms of their parents' rural expressions, master this new cosmopolitan language and jettison their native legacy. The ethical result is on first impression banal: people of hitherto incommensurate backgrounds can now converse freely. Ultimately the result is less than ethical: when specialized musical needs arise (in music therapy, for example, in the case of trauma), the musical lingua franca has no vehicle – no terms or idioms – to deal with the special instance, but rather only the tools to

address the common. Convergence has removed the possible.

If this is indeed the case, let us say then that a diminishing set of primarily urban modes of musical production and reception will play a greater role in the musical lives of an ever greater number of people concentrated in cities. Since placing more people in close proximity would seem to produce problems of overcrowding, in particular problems arising from the need to share resources or to express identity, this must have its deleterious effects. What is needed for social health is universal access to a broad pool of thoughts grounded in diverse experience – precisely the thing removed by convergence. What has emerged instead are two opposing tendencies: in one direction, the continued growth of a narrow canonic repertoire, international in nature; in the other direction, the ever more apparent need for a wide number of small repertoires characterized by individual idioms grounded in locale. Following the ethical philosopher Alasdair MacIntyre, we might say that these tendencies are *incommensurate*: “For each premise employs some quite different normative or evaluative concept from the [other], so that the claims made upon us are of quite different kinds.” (MacIntyre, 8) Wherever such incommensurate arguments arise, the grounds for resolution of ethical problems are tenuous at best, the probability of resolution slight (and often dependent upon some kind of revolution in thought or social circumstance).

## Counterarguments

It could be argued that in lieu of a great diversity of traditional idioms we now have a comparable diversity within the new canons of digital music, and that audiences are now capable of making subtle distinctions in quality between the mass selling canonic works. These arise by integrating new digitally inspired idioms with older, pre-digital forms (much like the Cantonese and English blend called *Kongish*, or the Korean blend with English called *Konglish*). If we return to ratio and bear in mind the mass uses to which music is applied, this new diversity becomes questionable. Insofar as digital reproduction

allows for music to be listened to anywhere, regardless of situation, there are no meaningful constructed local constraints upon musical performance, meaningful in scope when compared to the sales of 100 million recordings of *Thriller*.

It could be argued as well that the new digital tools of canon formation – the tools of digital media in particular, such as *Soundcloud* – will allow for a revival of diversity and locale in the hands of non-canonic musicians and musical institutions. While such developments are welcome, the new repertoires formed in this way are at present (and will continue to be) truly negligible in terms of ratio when compared to the extant digital musical canon.

## Conclusion

As was noted above, to bring about the demise or at least the drastic reconfiguration of digital musical convergence would require a revolution in the current modes of musical production, and in effect this would entail a revolution in social dynamics, since social media has become so integral to the world as a vehicle for self-identity. This revolution could take catastrophic form: dilemmas produced by, for example, ecological crisis or by cyber warfare would challenge the material basis of digital music distribution. But if a challenge to digital musical convergence is deemed necessary (as suggested here), it would be better to bring this about in a rationally guided form, either under the auspices of an international vehicle such as UNESCO or through national or local forums.

### Introduction

The fiduciary duty of boards of directors is to act in the interests of shareholders (Demb and Neubauer 1992; Hermalin and Weisbach 1998; Dominguez-Martinez et al. 2008). However, it is the incumbent board, not the shareholders, that nominates directors.<sup>1</sup> The incumbent board members may rely on their social networks to select

new directors; consequently, many newly appointed "outside" directors (i.e., directors who are not in the management team) may have priorities with the CEOs (Shivdasani and Yermack 1999). On the one hand, this practice might weaken the monitoring function of the board of directors, imposing agency costs on shareholders. On the other hand, the practice can improve the advisory role of the board and, therefore, is beneficial to firms that have more advising needs. This entry aims to broaden our understanding about the potential ethical issues that arise from director appointments through social networks of incumbent board members, especially CEOs.

### Director Selection from Board Networks

The social network of incumbent board members plays a significant role in director appointments. Cai et al. (2018) document that 75% of 9923 director appointments from 2003 to 2014 in their study have professional ties to incumbent board members. Further, it is uncommon to see contested elections in director appointments; that is, directors nominated to the board are often elected without any objection. Specifically, Cai et al. (2009) document that there were only four contested elections out of the 13,384 director elections at 2488 shareholder meetings in their study and that the typical director is elected with over 90% support from shareholders. In addition, Lublin (2009) reports that directors are often retained even in the unusual cases of less than 50% support, as evidenced by 93 board members at 50 companies in 2009 who received less than 50% of the votes cast but who were still held to be reelected by the board.

### Ethical Issues in Appointments of Directors from Social Networks of Management

#### CEOs' Involvement in the Selection of a New Director

A CEO may influence the incumbent board in its selection of a new director (Shivdasani and Yermack 1999). It is documented in Shivdasani

<sup>1</sup>The board of directors generally forms a nominating or governance committee that nominates directors. However, there is an ongoing debate about shareholders' access to nominations of directors (Campbell et al. 2012).

and Yermack (1999) that if the CEO serves on the nominating committee or if a firm does not have a nominating committee, the firm appoints more directors that are connected with managers. However, the CEO is one of the key people the board is supposed to monitor; a CEO's involvement in the selection of a new director can carry significant agency implications. Cai et al. (2018) document that nearly 39% of all new appointed directors in their sample are socially connected to the incumbent CEO. Studies have found that CEO involvement in the director nomination process has consequences in corporate governance and firm value. For example, Shivdasani and Yermack (1999) show that CEO involvement in the selection of directors is value-destroying to shareholders, as evidenced by a significantly lower stock price reaction to such appointments. Similarly, Cai et al. (2018) find that shareholders react negatively to new appointees with previous work ties to the CEO when the firm also exhibits weak governance. Even without direct CEO involvement, new members of the board might be linked to the incumbent directors who are likely appointed by the CEO, suggesting an indirect connection between the CEO and the new directors. Coles et al. (2014) argue that directors who join the firm after the CEO are more likely to have been appointed by the CEO and that these directors might compromise monitoring effectiveness of the board. Specifically, they find that the higher the fraction of the board comprised of directors appointed after a CEO assumes office, the higher the CEO is compensated, and the less likely the CEO is fired due to poor performance. Overall, board appointment of directors directly or indirectly connected to the CEO might increase the existing power of the CEO at the expense of shareholders.

### Potential Agency Costs of Social Ties Between Management and the Board of Directors

Conflict of interests between managers and shareholders of a firm might cause agency costs. A close relationship between managers and the board of directors might compromise the board's responsibility to act on behalf of shareholders. Consistent with the prediction about the agency

costs of the CEO's involvement in director elections, many studies show that social ties between management and the board of directors are likely to hamper the monitoring function of the board, which is detrimental to shareholders' value. For instance, Fracassi and Tate (2012) find that firms with more powerful CEOs are more likely to appoint directors with ties to the CEO and those ties reduce firm value, especially if there are no alternative governance mechanisms that can replace board oversight. Their study also suggests that firms with more CEO-director ties engage in more value-destroying acquisitions. Further, Hwang and Kim (2009) and Nguyen (2012) document that a CEO is less likely to be fired for poor performance when the CEO and a number of directors belong to the same social networks. In addition, Larcker et al. (2005) show that the links between outside directors and management are associated with higher CEO compensation. Similarly, Hwang and Kim (2009) find that firms whose boards have social ties to the CEOs award higher CEO compensation and exhibit lower correlation between CEO compensation and firm performance. Engelberg et al. (2013) study CEOs' networks *outside* the firm and document that CEOs with large networks earn more than those with small networks. In addition, some papers study the role of social networks in earnings management, i.e., the use of accounting techniques such as early recognition of revenues or delayed recognition of expenses to produce financial reports that present a (management) desired view of a firm's financial situation. For example, Hwang and Kim (2012) document that earnings management is positively correlated with social ties between the CEO and a director who is a member of the firm's audit committee. Extending this line of research, Cao et al. (2014) show that outside directors socially connected to their firms' senior executives earn significantly higher returns in stock sales transactions, suggesting the existence of insider trading when outside directors are socially connected to firms' senior executives. Chidambaram et al. (2012) show that non-professional connections such as nonbusiness service or alma mater between the CEO and board members increase the firms' likelihood to

misreport their financial statements. Furthermore, Khanna et al. (2015) also document that connections that CEOs develop with top executives and directors through their appointment decisions are associated with a higher risk of fraud and lower likelihood of fraud detection.

### Potential Benefits of Connections Between Management and Directors

While connections between management and members in the board of directors can be costly to shareholders, they can also be efficient and can create value to shareholders through improved information sharing between directors and managers. A director appointee with prior ties with the management team might feel more comfortable expressing her opinions to management, especially if her views differ from those of the managers, facilitating effective communication. The benefits of trust nurtured by existing relationships between managers and the board of directors are particularly important when management needs advice from the board. The role of the board of directors is not only to monitor but also to advise management. Adams and Ferreira (2007) in their theory model argue that a CEO faces a trade-off in disclosing information to the board: if she provides more information to the board, she receives better advice; however, she will also be monitored more closely as the board is more informed. Thus, a “management-friendly” board of directors can be optimal when the management has high advising needs from the board. Consistent with this theory, in the context of mergers and acquisitions, Schmidt (2015) finds that social ties between the CEO and directors are associated with higher merger returns when advising needs are high but with lower returns when the monitoring needs are high. Similarly, Kang et al. (2018) use CEO-director social connections as a measure of board friendliness and find that firms where CEOs and directors are socially connected create more patents and patent citations and these are associated with higher firm value. They also show that friendlier boards are related to more innovations and greater firm value in firms where innovation or advisory needs are important. Duchin and

Sosyura (2013) study the roles of social connections between divisional managers and CEOs in internal capital budgeting. They document that the social ties between CEOs and divisional managers improve investment efficiency when information asymmetry is high, with information asymmetry measured by industry relatedness across divisions, the dispersion of operations across divisions, and the distance from the headquarters to divisions. Overall, this line of research appears to suggest that social ties between the CEO and the board of directors might benefit some firms, but there are also risks, especially for firms where the monitoring role of board is critical.

### Conclusions

Director election is critical to effective board monitoring. The prevalence of director selection from the network of the incumbent board, and especially the incumbent CEO, raises questions about the efficacy of such practice. This entry discusses the important role of social network in recruiting new directors and the costs and benefits of appointing directors with social ties to management. While potential benefits are improved advising by the board through better information sharing, potential costs involve a compromise of board monitoring; these costs and benefits vary among different types of firms and industries. Hence, a board of directors should exercise caution when considering director candidates who have social ties with management of the firm, since the risk of ineffective board monitoring from hiring outside directors connected to the management might weaken sound ethical practices in corporations. These ethical issues underscore the role of corporate boards as their day-to-day influence on firm practices is hard to observe, but their involvement in firm governance is subject to great scrutiny when things go wrong. A strong board should be able to recognize potential ethical problems involving the election of directors from management’s social network and act on behalf of shareholders.

## Directors' Duties to Tie Executive Pay to Environmental Protection

Emerging fiduciary duties to the environment; Financial compensation

## Introduction

Directors and officers oversee the performance of companies. They develop business plans, strategies, and risk management policies, implement governance systems, and ensure that a company complies with laws and regulations. Their conduct and decisions have a critical impact on both the performance of companies and the interests of shareholders, investors, creditors, employees, consumers, local communities, governments, and the environment. Given their position in a company and the economy, corporate law treats them as fiduciaries and imposes duties on them.

Traditionally, the fiduciary duties of directors and officers have served the interests of shareholders only. This has often implied that they

have to discharge their duties to maximize profitability and shareholder value. Such a view has been particularly dominant in liberal market economies and has had less impact on coordinated economies that have adopted a stakeholder model of corporate governance. However, shareholder-oriented duties have been put into question in recent years. The corporate purpose of maximizing shareholder value has been subject to worldwide criticism that in turn has called for modifying directors' duties. Among the reasons for revising shareholder-oriented duties, the growing climate crisis has brought attention to the role of companies and directors and officers in exacerbating climate change. Companies and their operations are involved in causing pollution and climate change and are likely to suffer the consequences of the climate crisis. The world, including companies, is already experiencing the negative impacts of climate change. These include more natural disasters such as flooding, draughts, storms, heatwaves, and power outages; the deterioration of human health; a potential economic collapse involving reduced profitability, stranded assets, and inability to make loan repayments, attract investments, and market capitalization loss (OSFI 2021); and social instability caused by potential public health crises, massive job losses, public service interruptions, and environmental racism and classism. This has called for a rethinking of the purpose of the corporation and the orientation of the duties of directors and officers. These duties are gradually being amended to serve multiple stakeholders' interests including the environment.

This entry briefly examines whether directors have a duty to serve the interest of the environment and climate change. Specifically, it explores the extent to which such a duty may provide a legal basis for a duty of directors to tie executive compensation to climate change objectives. The emerging duty of directors to consider climate risk is fairly established across jurisdictions, but its enforcement is uncertain. Tying executive pay to climate change offers a complementary alternative to steering the conduct of directors and officers toward environmental objectives. A duty to tie pay to climate may derive from directors'

emerging duty to consider climate risk as the latter should also require directors to integrate climate considerations into their executive pay decisions. These claims are developed in several sections. First, this entry briefly reviews the fiduciary duties of directors and officers, namely, duty of loyalty and the duty of care with regard to climate change. It also highlights the impact of climate risk disclosure policies and recent climate-related corporate tort litigation. Second, after noting the potential non-enforcement of directors' duties to consider climate risk, it elaborates on a duty of directors to link executive pay to environmental protection. The last section concludes.

## **The Emerging Duties of Directors Toward the Environment**

Directors and officers have two main fiduciary duties, namely, the duty of loyalty and the duty of care. The duty of loyalty involves a duty to act in good faith without conflicts of interests and in the best interest of the company. The duty of care requires directors to act with skill and diligence including making decisions on an informed basis (Williams 2021). In some jurisdictions, the duty of loyalty may also include a duty of oversight that generally obliges directors to oversee companies' operations and compliance with laws and regulations. While the fiduciary duties of directors have traditionally served the interest of shareholders particularly in liberal market economies, such duties have been gradually expanded to serve the interests of nonshareholder stakeholders such as the environment.

The duty of loyalty has evolved to require directors to integrate climate risk into their corporate decisions. In the United Kingdom, section 172 (1) of the 2006 *Companies Act* states that "[a] director of a company must act in the way he considers, in good faith, would be most likely to promote the success of the company for the benefit of its members as a whole, and in doing so have regard (amongst other matters) to (a) the likely consequences of any decision in the long term, . . . (d) the impact of the company's operations on the community and the environment; . . ."

In 2019, the *Canada Business Corporation Act* was amended to codify the duties of directors toward stakeholders including the environment. In describing the duties of directors and officers, the new Section 122 (1.1) states that “[w]hen acting with a view to the best interests of the corporation under paragraph (1)(a), the directors and officers of the corporation may consider, but are not limited to, the following factors: . . . (b) the environment; and (c) the long-term interests of the corporation.” Similarly, section 166 (2) of India's 2013 *Companies Act* states that a “director of a company shall act in good faith in order to promote the objects of the company for the benefit of its members as a whole, and in the best interests of the company, its employees, the shareholders, the community and for the protection of environment.”

In the USA, the duty of loyalty also includes a duty of oversight (Williams 2021). This duty was established in the *Caremark* decision and requires directors to make good faith efforts to oversee both a company's business operations and compliance with laws and regulations otherwise they may face liability (*Marchand v. Barnhill*; Bainbridge 2021; Williams 2021). Specifically, “to satisfy their duty of loyalty, directors must make a good faith effort to implement an oversight system and then monitor it” (*Marchand v. Barnhill*). Directors must thus implement and oversee reporting or information systems or control so that they are in a position to be informed of risks and problems and respond accordingly (*Marchand v. Barnhill*; Williams 2021). The *Caremark* duty of oversight appears to be rooted in the duty of care (*Marchand v. Barnhill*; Wong 2015) and has been enhanced in a string of cases starting in 2019 with the Delaware Supreme Court's decision in *Marchand v. Barnhill*. In that case, the court expanded the *Caremark* duty to the oversight of “mission critical” aspects of a company. The court indicated that *Caremark* “does require that a board make a good faith effort to put in place a reasonable system of monitoring and reporting about the corporation's central compliance risks. In Blue Bell's case, food safety was essential and mission critical” (*Marchand*

*v. Barnhill*; Williams 2021). It may thus follow that, in seeking to fulfill the oversight duty, directors may be required to consider climate change risks and their impact on the company, its operations, long-term strategies, or disclosures (Williams 2021). The legal compliance aspect of the *Caremark* duty also requires directors to comply with ESG legislation and regulations (Bainbridge 2021). This may further boost directors' duty to consider climate risk (Strine et al. 2020).

The duty of care requires that directors and officers act with care, skill, and diligence including taking measures to avoid harms to the interests of their companies. The duty of care is well established across jurisdictions. Considerations of foreseeable environmental harm or climate risk can now be required from directors as part of their duty of care. For instance, commentators claim that the duty of care in Canada (Hansell 2020; Sarra 2021), the UK, and Germany (Schaloske 2021) obliges directors to act with skill and diligence to minimize climate risk and prevent environmental harms.

Furthermore, directors' obligation to consider the long-term interest of a company when discharging their duties further compels them to integrate climate risk into their decisions. Directors should thus take into account the impact of climate change on long-term firm performance and future generations. As mentioned earlier, section 172 of the UK's *Companies Act* and section 122 of *Canada Business Corporations Act* encourage directors to consider the long-term interest of companies. Similarly, in the USA, the Delaware Chancery Court's 2017 decision in *Frederick Hsu Living Trust v. ODN Holding Corp* pointed out that “fiduciary relationship requires that the directors act prudently, loyally, and in good faith to maximize the value of the corporation over the long-term for the benefit of the providers of presumptively permanent equity capital. . . .” Despite the emphasis on shareholder value, the Court's indication of the long-term focus of fiduciary duties provides further basis for incorporating climate risk into directors' decisions.

### Climate Risk Disclosure Policies

The proliferation of climate risk disclosure legislation and regulations around the world has also augmented the pressure on directors to consider climate change. For instance, in the USA, the Securities and Exchange Commission (SEC) is increasingly concerned about companies' exposure to climate risk and is encouraging companies to engage in further related disclosure while seeking to improve existing disclosure policies (Williams 2021). A 2021 *Climate Risk Disclosure Act* is being discussed in the US congress. This bill would direct the SEC "to require an issuer of securities to annually disclose information regarding climate change-related risks posed to the issuer, including an issuer's strategies and actions to mitigate these risks. Specifically, issuers must report their direct and indirect greenhouse-gas emissions and disclose their fossil fuel-related assets." Similarly, Canadian securities regulators and leading practitioners have recently stated that companies are obliged to disclose climate risks and the measures that they are taking to address them (Sarraf 2021). In 2020, the U.K. Chancellor of the Exchequer announced that climate risk disclosure will be mandatory for most companies as of 2025 (Cooper 2021).

Thus, the recent expansion of the duty of loyalty and duty of care along with heightened disclosure legislation may require directors to consider climate risk across jurisdictions. Directors may be expected to engage in assessing, monitoring, and preventing climate risk and its impact on companies. They may also solicit reports and conduct assessments to inform themselves and management of potential climate risks and take measures to mitigate the negative impact of climate change on a company and other stakeholders (Sarraf 2021).

### Further Expansion of Directors' Duties to Consider Climate Risk

More recently, a corporate tort court decision appears to confirm directors' duties toward the environment. In May 2021, the Hague District Court in *Milieudefensie et al. v Royal Dutch Shell PLC* "ordered Royal Dutch Shell (RDS) to reduce the CO<sub>2</sub> emissions of the Shell group by

net 45% in 2030, compared to 2019 levels, through the Shell group's corporate policy." This reduction obligation must involve all its value chain emissions (scopes 1, 2 and 3) and must be complied with even if it is not profitable or sacrifices shareholder value. Following that decision, RDS' directors appear to be required to take action to reduce emissions even at the expense of profitability. "RDS' reduction obligation ensues from the unwritten standard of care laid down in Book 6 Section 162 Dutch Civil Code," which implies that "when determining the Shell group's corporate policy, RDS must observe the due care exercised in society." The emissions harm citizens and thus breach Shell's duty of care. The Hague court interpreted such standard of care on the basis of dangerous climate change science and "the widespread international consensus that human rights offer protection against the impacts of dangerous climate change and that companies must respect human rights." Shell must comply with the ruling during any appeal process as it is provisionally enforceable.

This tort law decision sets a precedent for companies' duty of care and potentially for their directors to be aware of and manage the increasing climate risks. The *Shell* decision may have an impact not only on holding companies liable for climate-based harms, but also on reinforcing the emerging fiduciary duties of directors to consider climate risk across jurisdictions. Directors may be required to assess, monitor, and take action to minimize climate risks including the risk of corporate tort litigation and regulatory non-compliance, otherwise their companies may face tort liability for climate-related harms and be subject to regulatory and criminal investigations.

### Toward a Duty of Directors to Tie Executive Pay to Climate Change

While there is a growing consensus over the emerging fiduciary duties of directors to consider climate risk, the enforcement of such duties faces significant challenges, notably, the difficulties in proving directors' negligence and the possible lack of commitments from directors and

shareholders. This calls for complementary alternatives. Tying executive compensation to climate change targets may offer an important self-regulatory mechanism to align the behavior of directors and officers with the interest of the environment. Executive compensation provides strong financial incentives that very often drive and direct directors' and officers' decisions. Incorporating specific climate change targets into executive compensation promises to incentivize directors and officers to more rapidly and effectively implement corporate policies to meet those targets (Cevian Capital 2021; London Business School et al. 2021; European Commission 2020). Bonus, stock options, or clawback policies can be used to incentivize, reward, or penalize directors and officers for considering or ignoring climate risk. Tying pay to climate will also help remove a critical barrier to attaining climate change, namely, executive compensation policies based on stocks that steer directors and officers toward shareholder value maximization. Clear targets involving, for instance, specific emission reduction goals in the short term similar to those set in the *Shell* decision will likely deliver actual climate change.

Tying executive pay to climate change is consistent with the growing trend of linking executive pay to attaining nonshareholder value or non-financial objectives notably ESG (London Business School et al. 2021; Sullivan et al. 2021; Willis Towers Watson 2021). Companies are increasingly embedding the new purpose of the corporation in their compensation policies. This is the case of environmental protection. Major companies are reportedly linking senior executive pay to climate change performance that may spur significant progress toward a low-carbon future (Zizzo 2019; *Milieudefensie et al. v Royal Dutch Shell PLC* 2021). Pension funds are beginning to be active in that respect as well. For example, in Canada, the Quebec pension fund La Caisse has tied compensation to climate targets across the organization (Zizzo 2019). Similarly, some pension funds have proposed the expansion of clawback policies to address serious public health issues and consumers' interest. A coalition of 44 labor, religious, and public pension funds

have asked "10 drug manufacturers and distributors to report on how they are addressing business risks resulting from the abuse of opioid painkillers" and have advocated, among other things, "measures to expand clawback policies to recover pay from executives who inappropriately promote opioid drugs" (Westcott and Alliance Advisors 2018). These increasing corporate practices show the merits and feasibility of tying pay to climate change.

Despite its benefits and growing acceptance, linking pay to climate change faces significant resistance stemming notably from the opposition from self-serving directors, officers, and shareholders and shareholder-oriented executive pay culture. This is particularly the case of liberal market economies that have a long-standing shareholder primacy tradition. For example, in a 2020 publication, the Vice Chairman and cofounder of BlackRock, the world's largest institutional investor, Barbara Novick, embraces the 2019 American Business Roundtable's statement of the new purpose of the corporation and yet advocates the alignment of executive compensation with shareholder value only. She asserts that the "ultimate goal of any executive compensation program should be to incentivize senior executives to enhance their respective company's performance relative to prior years and its competitors for the benefit of all shareholders" (Novick 2020).

A duty of directors to tie executive pay to climate change may help overcome those hurdles. Under such a duty, directors may be required to link pay to climate and face liability if they breach it. It provides a legal incentive for directors and officers and shields them against shareholders' opposing pressures. Such a duty may derive from the emerging fiduciary duties of directors to consider climate risk. If directors are required to consider climate change, their executive pay decisions should also incorporate those concerns. Tying pay to climate has been considered in some jurisdictions. Section 87 of the *German Stock Corporation Act* states that "[f]or companies listed on the stock exchange, the remuneration structure is to be oriented towards the promotion of a sustainable development of the enterprise." It

may follow that German companies must adopt compensation policies that advance firm sustainability including climate change. In the same vein, a 2020 EY study for the European Commission recommended, *inter alia*, “to amend the Shareholder Rights Directive II to align executive remuneration policy with the long-term and sustainability goals,” in particular “[m]aking compulsory the inclusion of non-financial, ESG metrics, linked to a company’s sustainability targets, in executive pay scheme” (European Commission 2020).

The implementation of a duty to tie executive pay to climate change will likely face important challenges. Future research should thoroughly discuss critical factors such as the development of appropriate climate change metrics to be incorporated in compensation policies; directors’ ability to balance climate change objectives and multiple stakeholders’ interests; the deemphasizing of stock-based executive compensation in order to align pay with climate change; the extent of the likely opposition from self-serving directors and officers and shareholders (Edmans et al. 2021) especially controlling shareholders or common owners in concentrated corporate ownership contexts and in Carbon majors in particular; the role of civil society groups, local communities, and governments in pressing for relevant legal reforms and monitoring the implementation of pay-environment alignment policies; and the need to establish priorities in climate change targets when tying pay to climate change such as the mitigation of environmental racism and classism (Cunningham 2017). Needless to say, the nature of those issues varies across jurisdictions, and significant attention should be given to local contexts and the institutional environments in which the practice and regulation of directors’ duties are embedded.

## Conclusion

This entry has examined whether directors have a duty to consider climate risk and whether that duty may involve a duty to tie executive compensation to climate change targets. It found that both the duty of loyalty and duty of care of directors appear to require them to integrate climate risk into their

decisions across most jurisdictions. The Hague court’s 2021 *Shell* decision set a precedent for climate tort liability that may be followed by courts and legislators in other countries. The possibility of suing companies for climate torts may further reinforce the duty of directors toward the environment. However, its enforcement may face some hurdles, notably, the apparent lack of solid commitments from directors and shareholders. Tying executive compensation to climate change objectives offers an alternative mechanism to attain climate change in a more effective and rapid manner. The duty of directors toward the environment may provide a legal basis for requiring directors to tie executive pay to climate change. This is also consistent with growing corporate practices that are currently linking pay to the environment. Future research is needed to consolidate our knowledge of both the duties of directors toward the environment and the barriers to their enforcement taking into account the institutional peculiarities of every country and company. These general concerns and the need for further theoretical and empirical inquiries also apply to the potential duty to tie executive pay to climate change.

## Disability Management

### Introduction

While there are earlier historic examples of compensation, the link between disability and work has been formally acknowledged since the late nineteenth century when Bismarck introduced employers' liability in 1871 in Prussia. This acknowledged that work was a potential risk of injury or illness and that employers had a responsibility to minimize workplace hazards and to compensate workers who acquired an injury through work. This approach remains in place in many developed and developing economies in the form of occupational health and safety (OH&S) legislation and regulation and workers' compensation board (WBC) systems. The impact of these policies and procedures on occupational injuries and mortality is reported annually by most statutory agencies responsible for administering such systems. The ethics and economics of OH&S and WBC systems are enmeshed. The underlying ethical principles relate to nonmalevolence, justice, and the right of workers to expect that work will not negatively impact on their health and earning capacity. The economic arguments relate to the reduction of disability costs to the employer and society and the maintenance of the workforce productivity.

## The Distinction Between Disability and Impairment

Up until 1970s, the predominant view of disability was based on a medical perspective in which reduced functioning (impairment) was considered to be equivalent to disability. Disability assessment and interventions were focused on a person's functional capacity. The independent living and disability rights movements, which were established in the early part of the decade, drew a distinction between impairment, as an individual difference similar to gender or ethnicity, and disability which was the consequence of living in a society that assigned a negative value to being impaired. The social model of disability is the concept that underpins disability rights legislation. There followed 30 years of conflicted discourse which continues in many domains (Oliver 2013). One of the key concepts inherent in the social model is that disability is created by the social and physical environments in which a person lives and works. This can include inaccessible buildings, transport, and negative language, images, attitudes, and stigma. In 1996, the World Health Organisation initiated a process of dialogue between medical professionals and disability rights activists that culminated in the publication of the International Classification of Functioning, Health and Disability (ICF) in 2002 (World Health Organisation 2002). This has been referred to as a universal or biopsychosocial model of disability. The ICF retains the distinction between impairment, which describes a person's functional capacity, and disability, which is the negative implication of the dynamic interaction of a person and the environmental factors in which they live. The ICF views disability as part of the human condition and acknowledges that it intersects with personal factors such as age and gender. An important implication of the biopsychosocial model is that acquiring an impairment does not determine that a person will be disabled. Removing environmental barriers and putting in place facilitators can result in people, even

with severe or complex health conditions, being enabled to participate fully in the economic, social-cultural, and political life of society. Disability management is a set of coherent and linked interventions to increase the likelihood that an impairment does not result in a permanent disability.

## Historical Development

According to Murphy and O'Hare (2011, pp. 27–28), the first references to DM occurred in the 1980s. The articles appeared in US publications primarily devoted to vocational rehabilitation and promoted early intervention for workers who acquired or developed occupational injuries or illnesses. The arguments put forward for early intervention by employers were primarily based on the control of workers' compensation costs while at the same time meeting the needs of injured workers (Akabas et al. 1992). The terms used to indicate the DM approach often emphasized the employer's role in the process, e.g., employer-driven DM (Murphy and Foreman 1993), employer-based DM (Galvin 1986), and employer-led DM (Shrey and Lacerte 1995).

According to Akabas et al. (1992), DM referred to a workplace prevention and corrective strategy aimed at preventing disability from happening and, in the case where a worker acquired an injury, to provide early intervention which was coordinated and cost-efficient and included workplace rehabilitation. It required an organization to be committed to maintaining the employment of workers that experienced reduced functional capacity. A key ingredient was joining up prevention programs with allied health and return to work interventions (Loisel 2009). In 2003, the National Institute of Disability Management and Research proposed a consensus-based approach to disability management in which the role of workers and workers' representatives was emphasized (National Institute of Disability Management and Research 2004; McAnaney 2017).

## Characteristics of Disability Management

Disability management can be viewed as an umbrella term to describe the policies and processes that employers deploy to promote and protect the health, well-being, and productivity of the workforce.

Good practice guidelines specify a continuum of mechanisms to manage the workplace factors that have the potential to disable a worker and to assist workers who acquire or develop a health-related impairment that places their job in jeopardy to remain in employment or to return to work after absence. Key components include:

- Occupational health and safety
- Workplace health promotion
- Early identification of emerging health problems
- Workplace accommodations and supports
- Employee benefits design
- Occupational ergonomics
- Case management
- Return to work coordination
- Transitional work options

Organizational support mechanisms for a disability management program include:

- Joint worker-management support and empowerment
- Clarity of responsibility, accountability, and authority
- Workplace culture and policy development
- Information and communication management
- Knowledge of the disability management professional
- Monitoring injury, disability, and lost-time patterns

## Ethical Perspectives on Disability Management as a Business Strategy

The ethical principles of nonmalevolence and justice underpin the employer role in responding to occupational injuries through workers'

compensation insurance. An important development in the conception of the responsibility of employers toward people with disabilities has been the widespread implementation of anti-discrimination legislation which makes it illegal to discriminate against people on the grounds of their disability. The *UN Convention on the Rights of Persons with Disabilities* (2006) represents a landmark in this regard. Nondiscrimination legislation means the employers must not discriminate in the recruitment, selection, or promotion process on the grounds of disability.

This is also the basis for legislation that underpins the duty to accommodate workers who acquire or develop a health condition that reduces work capacity, while employed, regardless of the occupational or nonoccupational cause of the impairment. This is an important evolution in that it extends the requirements of equal treatment and social responsibility to accommodating workers with nonoccupational health conditions to assist them to retain employment. This development extends employer responsibility to the 80% of workers who acquire or develop an impairment as a result of nonoccupational causes.

In some jurisdictions, there is a growing consensus that employers have not only a responsibility to reduce the risk of impairment associated with occupational factors and to treat job applicants with impairments in an equitable manner but also to promote the health and well-being of all workers. While there is no legal or regulatory obligation for this, the grounds of economic and social responsibility and the social contract with the individual and wider society provide a strong basis for this argument.

Jurisdictional and cultural differences can impact on the disability management procedures adopted by employers and by the state. One influence is the type of funding mechanisms operated by the statutory authorities and whether these are based on social insurance, private insurance, or general taxation. A clear example of this is jurisdictions that operate no fault workers' compensation systems for occupational health conditions and tax-based systems for workers with

nonoccupational health conditions, for example, many states in the USA and Australia operate such dual systems. In the Netherlands, employers are considered to be responsible for supporting ill or injured employees for up to 2 years regardless of the cause of the health condition and use private insurance to mitigate this risk (Ståhl et al. 2014). In Finland, the Work Ability approach places responsibilities on both the employer to reduce the impact of work on workplace health and the individual workers to seek to maintain their health and work capacity (Ilmarinen 2009).

Ståhl et al. (2014) noted that the characteristics of the sociopolitical system in which employers were operating (e.g., tax-funded or market-based systems) impacted on the types of stakeholder responsibilities that were accrued and the status of the worker or the employer as client of the DM process. They concluded that a social contractual approach can help to inform an analysis of these types of cultural and legal differences.

The ethical standards for professionals responsible for operating DM programs on behalf of employers and insurers are more clearly delineated. These include integrity, promoting the welfare of individuals with whom they are working, promoting and protecting the employability of workers, maintaining their competence, promoting knowledge in the field, and complying with laws and regulations (National Institute of Disability Management and Research 2007).

## Displacement and Refugees with Respect to Human Rights Regimes

## Defining the Issues

The seven decades following the Second World War have witnessed a steady upward increase in the forced displacement of men, women, and children worldwide. This has been the result of famine, disease, civil wars, religious, and political persecution at home, post-war conflicts in Afghanistan, Iraq, Libya, and, most recently, the rise of the Islamic State (ISIS). Some make the perilous journey to a neighboring country and others take further risks by travelling long distances by road and by sea to the richer parts of the world – Europe and North America. In its Global Trends 2016 Report, the United Nations High Commission for Refugees (UNHCR) points to the largest increases in the displaced population around the world since the Second World War: the number of the displaced (refugees, asylum seekers, stateless people) stood at 65.6 million people, the equivalent of 20 new displacements every minute, one every 3 s. The children are the most vulnerable population and, according to the Agency's report, 75,000 unaccompanied and separated children sought asylum in 70 countries. ISIS-related violence alone has led to the flight over 3.3 million from Iraq and over 3.8 million Syrians with a further 7.6 million displaced inside Syria itself. In 2018, more than 700,000 Rohingya Muslims fled to neighboring Bangladesh from Myanmar where they have lived for generations, in order to escape brutal physical and sexual violence at the hands of military-backed vigilante

groups made up of non-Muslim villagers as a part of an ethnic cleansing project. The Myanmar army openly asserted that the Rohingya Muslims had no roots in the country and had been involved in terrorist activities. As well the civilian leader Aung San Suu Kyi (a Nobel Peace Prize laureate and once an icon of defiance against tyranny during her 21-year long house confinement by the Burmese military regime) backed the military, rather than supporting the persecuted minority, claiming that the crisis in Rakhine state was being distorted by a “huge iceberg of misinformation.”

While on the one hand the international human rights and legal refugee regimes have proven ineffective in dealing with the upsurge of displaced populations; on the other hand, the world community's response has not been hesitant to exercise their legal rights to control who enters their territory and has enhanced their surveillance of those who enter and who are pushed out. Concerns of national security against Islamic terrorism, particularly after 9/11, have loomed large, compounded by a turn in Europe and North America towards right-wing nationalist and anti-immigration agendas. Severe restrictions have been imposed on the entry of refugees. A dozen or so countries of the European Union have built barricades/fences to try to keep out both migrants and refugees. Fences and stretches of barbed wire surrounding cramped tents and makeshift huts which could not conceal the inhumane conditions of their inhabitants became a common sight during the Syrian refugee crisis. While in 2015 the shocking images of a drowned Syrian boy alerted the world to the tragic plight of refugees, empathy was limited and short-lived. For example, President Obama vowed to take in 10,000 refugees but, at the same time, screening out potential terrorists remained the focus of the department of Homeland Security. Similarly, India, instead of opening its borders to the Rohingya refugees and easing the burden of Bangladesh, decided to deport 40,000 Rohingya refugees who had arrived between 2012 and 2017 (a process halted by the Indian Supreme Court), promising to stand firmly with Myanmar in its “fight against terrorism.”

All this raises several questions: what is the moral or the ethical obligation of the world community towards the displaced population? Or as Benhabib puts it, how should one reconcile the rights of citizens and the human rights of others? (2004) Is it possible to reconcile the paradox of the universal agenda of human rights with the state's sovereign prerogatives and its commitment to its citizens first before the others? Is it possible to enhance the moral authority of the international actors to intervene where nations fail to protect their own people? How should the international refugee and displacement legal regime address the plurality of circumstances and generate prompt responses to the local, context-dependent particularities of displacement? And while geopolitical issues no doubt loom large as negative factors in the accommodation of the rights of the displaced populations, it can be argued that the preponderant impediments, the real barriers, are in fact jurisprudential/conceptual in nature. Shouldn't we therefore be moving beyond the definitional categorizations and distinctions between refugees, internally displaced, asylum seekers, stateless, and migrants and support the legal attempt of the international refugee to strike a balance “between too narrow a framework that risks excluding people who share similar characteristics and one so broad that it loses focus on the distinct protection and assistance needs arising from forced displacement” (Mooney 2005: 13)? In order to reflect upon these questions, it is imperative that we describe the incremental development of the international refugee/displacement regime.

### **Development of the International Refugee Protection Regime**

The institutionalization of human rights in world politics took place in response to the horrors of the Second World War. The United Nations served as a forum for the adoption of major international human rights conventions. On December 10, 1948, the Universal Declaration of Human Rights (UDHR) was adopted and proclaimed an authoritative statement of fundamental rights accepted across cultures and moral traditions.

Contemporaneous parallel efforts were also made by the UN to resettle post-war refugees from around the world. The Economic and Social Council of the UN requested the Secretary General to “undertake a study of the existing situation in regard to the protection of stateless persons” and to “submit recommendations to the Council as to the desirability of concluding a further convention on the subject.” In 1950, the UN General Assembly created the UN High Commissioner for Refugees (UNHCR) and in 1951 Convention Relating to the Status of Refugees was adopted. The scope of both the UNHCR and the Convention was limited to providing protection for the post-World War refugees who were “affected by the events occurring in Europe (or elsewhere) before 1 January 1951” (Gallagher 1989: 580) within a 3-year time period. Kelley and Durieux observe, “Both documents adopt a relatively narrow definition of ‘refugee’ as a person who, as result of events occurring before 1951, is outside his or her country because of a well-founded fear of persecution for reasons of race, religion, nationality, political opinion, or membership in a particular social group” (2004: 7). It was not without consequences: this narrow definition of a refugee and its geographical limitation was the reason why both India and Pakistan were unable to convince the United Nations to provide assistance or protection to their ten million refugee populations resulting from decolonization and the partition of the subcontinent in 1947.

Irrespective of its limitations, the 1951 Convention remains the first and the only binding refugee protection instrument. It codified the Principle of Non-Refoulement as a fundamental principle of international refugee law. Article 33 of the Convention prohibits “any Contracting State to expel or return (‘refouler’) a refugee in any manner whatsoever to the frontiers of the territories where his life or freedom would be threatened.” Since the adoption of the Convention, there has been a slow yet steady development as well as a broadening of the definitional parameters of displacement. The 1967 Protocol Relating to the Status of Refugees was to remove the geographical and temporal restrictions, thus giving the Convention universal coverage. Moreover, this

codification of refugee rights has been supplemented by legal regimes in several regions (for example, the Organization of African Unity Convention 1969; The European Union Council Directive 2004; the Cartagena Declaration on Refugees, Columbia 1984). While the 1951 Refugee Convention has been ratified by 145 States, some of the 43 non-signatory countries host important refugee populations, making it challenging for the UNHCR to ensure the applicability and compliance of humanitarian standards set up at the international level.

Responding to different circumstances, the UNHCR has been able to expand its initial limited mandate to include the protection of the rights of children and women and internally displaced populations. Two significant developments were: (a) the 1979 International Conference on Refugees and Displaced Persons in South-East Asia to deal with the flight of massive number of Vietnamese refugees (as a result the ASEAN countries pledged to provide temporary asylum and the Western countries to accelerate their resettlement); and (b) the 1989 UN Convention on the Rights of Children (the UNHRC contributed to the drafting of this Convention and Article 22 pertains specifically to the refugee regime). In the early 1990s, the issue of internal displacement was to become increasingly integrated within the international agenda and very substantial progress has been made in the refugee discourse (Chimni 1998; Pacitto and Fiddina-Qasmiyeh 2013; Weiss and Korn 2006).

During the 1990s, with the mounting crisis of internally displaced persons (IDP) due to an increasing number of civil wars and genocides committed within the national borders of the Balkans and Rwanda, UN Secretary-General Kofi Annan actively undertook the task of pushing the members of the United Nations to find common principles on the basis of which the international actors could use their moral authority to intervene where nations fail to protect their own people. In his 2000 Millennium Report, Annan asked categorically: “how should we respond to a Rwanda, to a Srebrenica, to gross and systematic violation of human rights that offend every precept of our common humanity?” This was to lead

to the coining of a new concept – the Responsibility to Protect – which would have the international community take the responsibility to act and hold governments responsible who do not meet their obligations to protect their own citizens. In other words, attempts were made to reformulate the concept of territorial sovereignty by moving it from its legal frame of reference, i.e., the absolute authority of the national state within a bounded territorial space, to the normative one of “sovereignty with responsibility.” At the 2005 World Summit to prevent genocide, war crimes, ethnic cleansing and crimes against humanity, R2P, the Responsibility to Protect doctrine, was adopted. In 2009, UN Secretary-General Ban Ki-moon’s report “Implementing the Responsibility to Protect” was released.

In order to coordinate the governmental and nongovernmental sectors, in 2005 the UNHCR started the Convention Plus. With its aim to improve refugee protection worldwide and to facilitate the resolution of refugee problems through multilateral special agreements, the Refugee Agency tried to address the issues not covered by the 1951 Convention. These included operational arrangements with Governments, often in relation to a particular group of refugees or a specific situation; the strategic use of resettlement as a tool of protection; finding a durable solution by an effective targeting of development assistance; and clarification of the responsibilities of the national government during irregular secondary movements of refugees and asylum-seekers.

While the international community was to recognize its moral and ethical responsibility towards the internally displaced person, the distinction between refugee and IDP was maintained. Consequently, the UNHCR was to push the national governments to prepare and enact legislation to address internal displacement, thus reinforcing its initial distinction between the two with the IDP falling under the jurisdiction of national governments. The 2008 Manual for Law and Policy Makers, titled “Protecting Internally Displaced Person”, prepared by the newly created Representative of the Secretary General on the Human Rights of Internally Displaced Persons, clearly

laid out: “it is not the international community but national authorities that “have the primary duty and responsibility to provide protection and humanitarian assistance to internally displaced persons within their jurisdiction” (2008).

## Challenges

No doubt the international refugee regime has widened its scope, both in terms of protecting different categories of displaced peoples and moving beyond its initial European focus, but the recent Syrian and Rohingya refugee/displaced persons crisis point to three remaining major challenges.

First, a large number of internal displacements do occur and are still occurring within the boundaries of a nation state as a result of specific socio-political complexities, in particular disputes over the control of sovereign power, sectarian conflicts, and ethnic cleansing. The refugees or displaced persons, while trying to escape horrific conditions, inadvertently get trapped in legal and administrative regime structures. The international Refugee regime compels us to view categories of displaced persons through the lens of a fixed set of labels of “refugees,” “migrants,” and “internally displaced persons.”

Second, as Alexander Betts points out, the parallel international and overlapping regional institutions which have emerged since the 1990s in response to the increasing South-North migration have enabled states to circumvent the UNHCR and the 1951 Convention. For example, “the EU has developed Frontex, the EU’s border control agency, which engages in military patrol of attempts of migrants to acquire access to the EU’s Southern or Eastern borders” (2009: 55). Similarly, the parallel institutions to UNHCR such as the International Migration Organization (IOM), the Global Commission on International Migration (GCIM), and the Global Forum on Migration and Development (GFMD) pursue their specific agenda on migration, sometimes overlapping and at other time contradicting the UNHCR institutional mission. Betts observes that IOM “provides services to the European

states that enable them to limit the access of asylum seekers crossing from Sub-Saharan Africa to the EU via the Maghreb” (2009: 55–56).

Third, the shifting ethnic characteristics of the displaced and the refugee populations – from European during the early post-WWII period to Asian, African and Islamic – has led to negative and intolerant attitudes in the West towards the “outsiders.” Right-wing parties with vocal anti-immigrant policy platforms have been growing in number of European countries and have made electoral gains. While the European far-right parties with anti-immigration agendas go back to the 1980s, amid Europe’s current refugee and migrant crisis their rhetoric has revived and taken on renewed weight. With politically charged language, suspicion has turned into fear of the “Other.” In the United States, President Trump has seized upon immigration as the cause of countless social and economic problems and is determined to pursue an anti-immigration agenda and restricting the entry of foreigners, especially from predominantly Muslim countries.

## Moving Forward

These challenges can be met by first ensuring that we make attempts to pluralize the term displacement by opening up the refugee discourse to addressing the context dependent character of displacement and examining how one ought to address the interests and needs of those who get stuck in these local particularities. Moreover, in addition to streamlining the mandates of the international parallel institution such as the IOM and the regional arrangements like that of the EU and making these consistent with the UNHCR, it has increasingly become imperative that moral principles of the dignity and rights of all human being are reconciled with the legal principle. Seyla Benhabib has put it very aptly, “From a moral standpoint, human beings are not divided into citizens, refugees, and migrants. Morality is the obligation we have to the Other” (2015).

## Distributive Justice

## Introduction

Like all discussions of justice, ideas about distributive justice are inherently evaluative in the moral or ethical sense. In the case of distributive justice, the object of evaluation is the distribution of income and wealth. Other economic advantages or harms (especially environmental) are sometimes considered, but it is convenient to restrict the discussion to income and the ownership of wealth.

The distinction between income and wealth is fairly clear in a general sense, though each can be converted into the other (assuming a person has enough income to allow saving). Income can be viewed as a loose proxy for consumption. Wealth includes the ownership of the means of production (such as factories, mines, businesses, and so on), but it also includes ownership of government debt and consumer debt, that is, claims on the future tax income of governments and the future wages of labor.

The main problem with moral evaluations of economic distribution is that there is no agreed principle that specifies the criteria of evaluation. Of the possible principles, this entry will discuss the following: egalitarianism, safety-nets, equal opportunity, desert-based theories, utilitarianism, and process-based theories. The entry will also briefly comment on feminist, Buddhist, and North American aboriginal ideas about distributive justice.

**Egalitarianism:** Strict economic egalitarianism maintains that justice requires every individual in a society to have equal amounts of income and/or wealth. Few advocate such strictness as it is open to the objection that its maintenance requires constant government interference and redistribution. Mostly egalitarians view equality as a moral ideal such that all departures from it must be morally justified. For example, John Rawls' (1971) maximin principle (also known as the difference principle) allows inequality of income and wealth if such inequality benefits the least well-off in a society. A common application of this principle would say that if giving some people monetary incentives means that they generate enough wealth to make the poor better off, then it is ethical

to allow the wealth creators to be richer than other people.

The egalitarian assumption is often viewed as a fundamental moral principle that does not need justification. It relies on the human instinct that fairness requires equality. And indeed, human infants at a very early age react negatively to unequal treatment (and so do some other primates). Children view a pie divided fairly as one that is divided equally. If pressed, some economic egalitarians refer to a more basic egalitarian principle such as that all people deserve equal respect.

Besides rejecting egalitarianism as a fundamental principle, objectors can point out that egalitarianism is an outcome-based moral theory and as such can require constant government action, usually redistribution of wealth and/or income, to ensure the desired outcome. Such government action can interfere with other values such as freedom, human rights, or property rights.

A more recent justification for at least some increased economic equality relies on data that show economic inequality causes serious social harms. If wealth or income distribution is measured by the Gini coefficient (a high Gini coefficient means less equal distribution), a high national or state Gini coefficient correlates with low life expectancy, poor health, poor educational outcomes, high crime rates, and many, many other social problems. (Wilkinson and Pickett 2010, give an overview of the data as of 2009). This use of the Gini coefficient and the resulting data have been questioned.

**Safety-net theory:** Safety-net theories are sometimes confused with egalitarianism, probably because safety-nets generally involve at least some redistribution of income. However, safety-net theories are only concerned about the minimum level of income in a society and generally are indifferent to economic distribution among all those above the minimum. Most welfare systems are justified as safety-nets, and food stamps, negative income taxes, Medicaid, and other transfers and services for the poor often close holes in the safety-net. A Universal Basic Income (UBI) is probably the most efficient, most thorough, and clearest form of a safety-net ensuring a minimum income for everyone.

Safety-net theories are sometimes justified using the fundamental moral principle that no one should be destitute in a rich society. There are also utilitarian justifications, such as the fact that destitution causes crime, un-aesthetic neighborhoods, harbors for disease, and alcohol and addiction problems. These harms can be multigenerational.

Occasionally arguments are advanced about limiting the other end of the wealth and income scale. Some people think there should be a limit on how rich an individual can be, either on grounds of fairness or more often because it is thought great concentrations of wealth harm society (usually because of the political power wealth gives). Wealth taxes and inheritance taxes are the most common tax policies proposed to deal with wealth concentration, but regulation of the financial industry controls on corporate governance, and antitrust laws can also be aimed at preventing excessive concentrations of wealth.

**Equal opportunity:** Proponents of equal opportunity believe that a just society is one in which everyone, as each one enters the economic system as an adult, has an equal chance at gaining economic goods supplied by wealth and income. In practice, this means firstly a huge emphasis on government supplied (or at least government paid for) K-12 education, preschool and daycare, school nutrition programs, and other government policies that give every child an equal opportunity to live a fulfilling life. Proponents of equal opportunity also generally advocate affordable or free college and university education for all who qualify and admission procedures that are unbiased.

In a modern capitalist society, education is vitally important, but equal opportunity also implies equal access to capital, at least when people are first entering the economic system. If intergenerational transfers are based on inheritance, the children of the rich and powerful have opportunities that others do not have. Some proponents of equal opportunity argue for high inheritance taxes, sometimes even 100%, with the government using the resulting revenue to give every citizen a capital grant on his or her 18th birthday. This idea has been criticized because even if governments can distribute capital equally,

they cannot equalize the understanding of investment, diversification, delayed gratification, risk-taking, and so on. A huge number of people do not even realize that invested money can supply a stream of income; such knowledge is irrelevant to surviving in the culture they live in. More likely in such a culture is the deeply learned lesson that any money that comes your way should be spent immediately or it will be taken from you.

Such reflections raise the issue that income and wealth are greatly impacted by character traits (such as intelligence, risk-taking, and ambition) and the abilities to concentrate, delay gratification, persuade others, manage businesses, and so on. Some proponents of equal opportunity (especially in the philosophy literature: see Dworkin 1981a,b) recommend that people who lack these characteristics should be compensated. Others argue that those who are intelligent and ambitious, for example, deserve more wealth and income than others (see desert based theories below).

**Utilitarianism:** A distribution of wealth or income is just by utilitarian principles if that distribution maximizes the “greatest happiness of the greatest number.” The current debate about using “national happiness” (instead of GNP growth) as a measure of progress is driven by the utilitarian approach. Other utilitarians use criteria such as human well-being instead of happiness as their goal. Economists often use desire satisfaction or utility.

Utilitarians generally do not propose careful consideration of each individual’s happiness; instead, they propose policies and laws that tend to promote human happiness and well-being in general. They also advocate careful sociological study of the outcomes of implemented laws and policies to ensure that they are working by promoting happiness and well-being.

For example, utilitarianism is behind the careful study of the social effects of economic inequality. High levels of inequality, it is argued, result in high crime and murder rates: poor educational outcomes, mass incarceration, increases in chronic health problems, high infant mortality rates and short life expectancies, and so on. If these data are correct, then the utilitarian

conception of justice would require a more equal distribution of wealth – providing the resulting policies did not discourage wealth creation so greatly that the economy shrank significantly. Utilitarians would always want results to be monitored.

**Desert based theories:** Desert base theories of distributive justice require that the economy and government policies are designed so that people get the income and wealth they deserve. Most commonly, proponents argue that free markets reward hard work, risk-taking, and productivity. It is often added that poor people are usually poor due to laziness, indifference, and weakness of character leading to drug addiction, inability to save, and so on. Since the poor do not deserve any increase in income, desert-based series of justice do not require the implementation of welfare or redistribution policies. Exceptions can be made for the disabled and others who were poor through no fault of their own.

Although the attitude that justice consists in people getting what they deserve is common, a closer look at desert-based theories of justice reveal significant problems. The criteria of desert are seldom clear. Some combination of effort, contribution, and need is suggested by most proponents, but (by Arrow's impossibility theorem) there can be no way of optimizing the outcome of three criteria, assuming each criterion provides ordinal rankings of possible distributions. The free market does not reward effort if a person has limited abilities, and it certainly does not consider needs. Free markets do tend to reward contribution, but contribution is difficult to measure in the complex world of corporate business. In corporate capitalism, distribution seems to be more based on economic power than the marginal productivity of each individual.

Governments sometimes try to base welfare and other redistributive policies on desert, by, for example, rewarding workers more than the unemployed or by directing aid to those in need. However, to do so governments must put in place extremely expensive desert monitoring systems staffed by large numbers of government workers. Such systems are not only expensive, they are also intrusive into the lives of many citizens because

they require verified information on many extremely personal factors. For these sorts of reasons, it is sometimes claimed that even if justice is connected to people getting what they deserve, it is too expensive and too intrusive for governments to undertake this form of justice. Proponents of a Universal Basic Income generally argue this way.

**Process-based justice:** All of the above theories are outcome-based; that is, they propose that justice consists in a certain state of society (equal income, equal opportunity, or so on) and that policies and actions ought to be aimed at establishing a just state of affairs. Process-based theories of justice reject this approach completely; instead they maintain that judgments about the justice of an economic system depend on the processes within that economy, never on the outcomes of those processes. If the processes are just, then the system is just regardless of the resulting distribution of wealth or income.

The most commonly cited principles of just processes are just ownership and just transfer of private property. A transfer is just if both parties give informed consent. Ownership is just if the owner acquired the property justly by just transfer or by creating the property through their own labor (either physical or intellectual). In general, defenders of process-based theories of justice are champions of free markets.

The first issue this approach raises is the question of taxation. The implication is that no taxation is just and that therefore there should be no government. Most process-based theorists back away from such an anarchist position; instead they argue that the sole legitimate purpose of governments (and the sole legitimate use of tax money) is to enhance and preserve a justice system of private property and just exchanges. Security of person is added on the grounds of self-ownership. But using taxpayer money to supply any other government service is considered unjust. The resulting minimal government is referred to as the night-watchman state (Nozick 1974).

One common objection to the process-based approach to justice is that it requires that the original acquisition of property, especially land and natural resources, was just. This is difficult if

not impossible to show, since if the current ownership of land and natural resources is traced back through prior owners, then no matter how many just transactions lead up to the present, at some point in the past the property was obtained by conquest, violence, fraud, or other nonconsensual means. Almost the whole of North America, for example, was acquired from Aborigines by force by European settlers. This fact may undermine much of the moral persuasiveness of process-based theories of justice.

**Other Approaches:** Although most discussions of distributive justice considered the justice of the distribution of income and wealth across society, there are other approaches and issues. Feminists have raised issues about just distribution within families that are generally missed in discussions of the economy as a whole. Feminists have also raised questions about intergenerational distributions, such as the justice of inheritance and estate taxes, but also about the justice of harms (such as pollution or resource depletion) that we are currently imposing on future people. Such questions are now widely debated.

North American aborigines, and those who listen to their perspective, often question whether wealth (especially the means of production and more especially land and natural resources) should be owned by individuals – perhaps wealth should belong to families, clans, bands, tribes, communities, or nations. But others wonder if such ownership structures are possible within a larger capitalist society, and their basis in tradition has been questioned (Miller 2012).

Communists, of course, think that the means of production should be owned by an economic class, namely, the proletariat. Underlying this view is Marx's claim that justice and injustice do not lie in the distribution of income and wealth, but in the relationships of production (see, for example, *Critique of the Gotha Program* in Marx and Engels 1959). Historically, ownership by the proletariat has meant ownership by the state, which leads to a planned economy. There is now a wide consensus that planned economies do not work. Some communist think that workers, not the state, should own their own workplaces. There have been some historical examples of this,

such as in the now disappeared Yugoslavia, but the most often cited example now is the Mondragon co-operative in Spain. However, scholars such as Heath (2014) argue that there are good theoretical reasons why shareholder-owned corporations generally outperform cooperatives.

Finally, some people, such as Buddhists, claim that the distribution of wealth and income are not key factors in the moral assessment of a society. They think that we should be paying attention to more important things than money and property. They recognize that destitution is undesirable, but the solution to destitution should lie in the charity of those who can afford it.

## Summary

Distributive justice concerns the moral evaluation of economic goods and harms, especially (but not exclusively) income and wealth. There is little agreement on the criteria of such evaluations; various people defend: egalitarianism, safety-nets, equal opportunity, desert-based theories, utilitarianism, and process-based theories. The discussion of these is on-going. Feminists have raised the issue of evaluating distribution within families. There are also issues about intergenerational justice. Some North American aborigines (and others) have raised questions about whether individuals should own wealth (especially land and natural resources) or whether wealth should be owned by families, clans, tribes, or nations. Other people, including Buddhists, wonder whether the distribution of wealth and income is an important moral issue.

## Diversity, Equity, and Inclusivity (DEI)

## Introduction

For at least the past few decades, governments, companies, institutions of higher education, etc., have introduced and promoted policies and practices under the label DEI or diversity, equity, and inclusivity. This is a general commitment that has

been adopted across many, primarily Western, democratic nations, although the breadth and commitment to equality of rights was entrenched earlier in contemporary history in the 1948 United Nations Declaration of Human Rights. Such rights have been further expanded upon in various other documents ratified since the original declaration which specifically identify groups who have been systemically discriminated against (e.g., women, disabled, Indigenous people).

The nature of equality and human rights has been discussed throughout the history of scholarly inquiries into the nature of human beings, initially in Philosophy and later in the evolution of rights talk in History, Political Science, Sociology, Psychology, Education, Economics, and Law, among other disciplines. These worthy discussions are beyond the inquiry into the current discussion of modern policies on DEI; some of which are covered elsewhere in this encyclopedia.

Both in Philosophical and Economic theory, there is considerable discussion about the use and distinctions between the terms “equity” and “equality.” It is interesting to note that the terminology of DEI generally does not discuss these terms but rather has seemingly and universally opted for the term equity. When reasons for equity are noted, it is generally identified as the idea that equity is focused on outcomes which is the desired goal of these policies rather than processes like notions of equality of opportunity which, at best, are necessary if not sufficient conditions for meeting such employment goals as proportional representation in occupations or educational equity or pay equity which includes equal pay for equal work and equal pay for work of equal value.

The purpose of DEI is to bring equity to populations of persons who are identified as historically and systemically discriminated against in terms of equality of access, hiring, promotions, and representation.

With respect to the categories of persons who are identified as members of historically and systemically discriminated against, categories vary by sector and nation. According to the United Nations,

The principles of equality and non-discrimination are part of the foundations of the rule of law. As Member States noted in the Declaration of the High-Level Meeting on the Rule of Law, “all persons, institutions and entities, public and private, including the State itself, are accountable to just, fair and equitable laws and are entitled without any discrimination to equal protection of the law” (para. 2). . . [This includes a commitment] to respect the equal rights of all without distinction as to race, sex, language or religion (para. 3).

The international human rights legal framework contains international instruments to combat specific forms of discrimination, including **discrimination against indigenous peoples, migrants, minorities, people with disabilities, discrimination against women, racial and religious discrimination, or discrimination based on sexual orientation and gender identity.**

Although the identifiers or descriptors vary from policy to policy, the main categories generally attempt to be as inclusive as possible. Much of the scholarly literature on the topic is empirical in nature, illustrating underrepresentation in certain career or educational categories and/or inequitable compensation for members of the designated group when compared to the dominant group (generally classified as white males). Where education and experience are matched but compensation is not, advocates of DEI argue that discrimination is the most clear and cogent explanation for the discrepancy. In this vein, Economist Bourguignon (2015) notes,

In most countries, education differentials between men and women have virtually disappeared and, with a higher participation of women in the labor force, job experience has also equalized. The remaining wage differences are thus a result of either discrimination, in a strict sense, women being paid less for exactly the same work, or remaining differences in non-observed characteristics of salaried employees.

Having noted the empirical nature of much of the literature, DEI is nevertheless embedded in the philosophical literature of its precursor, affirmative action. Affirmative action was the initial term about which were philosophical arguments for and against legislated approaches to achieving proportional representation of designated discriminated against groups based on incentives and quotas. In favor of just approaches were

arguments about the inadequacy of equality of opportunity, a principle which presumes that if all positions are publicly advertised and open and the competition is fair then whoever wins the position, the competition is deemed fair and just. The problem with the principle, argued critics, is that it presupposes that everyone in the competition is equal to start with which is not the case with members of groups that are discriminated against. Critics argue on historical, empirical, and philosophical grounds that the assumption of equality at the starting line with equality of opportunity is false. Poverty, racism, and sexism discriminate against equality leading up to the competition so that it is unfair. Further, an open competition does not address bias, conscious or unconscious in a job hiring process by those evaluating candidates.

Briefly, the arguments against affirmative action on philosophical grounds and the rebuttal against such arguments are as follows:

### Reverse Discrimination

The reverse discrimination argument is that if discrimination is morally wrong then so too is reverse discrimination. Two wrongs do not make a right. If I am a fully qualified and admissible candidate for a position in a medical school program, then it is unjust and unfair if I am not admitted because the scale is weighted in favor of a quota system which tilts the competition for individuals who are members of discriminated against groups. The rebuttal to this argument is that the continuing discrimination of groups of disadvantaged persons outweighs the minority of privileged individuals who are unsuccessful in admission to the program.

### Compensatory Justice

Another argument against affirmative action is that group compensation is unjust and may end up compensating members of the discriminated group who are actually privileged. For example, a wealthy, upper-class member of a discriminated group may be compensated by being admitted to a university or being hired for a job and an unsuccessful but qualified candidate may be poor and de facto discriminated against. The counterargument

is that the status quo where the majority of persons belonging to discriminated against groups which is broadly unfair outweighs the minority who may be unfairly treated by the systemic approach to widespread inequality.

### Contrary to Competence

The third argument is that merit and competence are compromised when being a member of a disadvantaged group trumps merit and competence in a competition. There is a serious problem, it is argued, if universities and organizations are forced to favor members of disadvantaged groups over the best qualified. The counterargument is that many candidates are equally qualified or better but discrimination eliminates their candidacy if formal policies and practices are not put in place to counteract it.

## Doctrine of the Mean and Business Ethics

Chris Provis

Balance; Harmony

### Introduction

Within both Western and Eastern ethical traditions, there is a Doctrine of the Mean, suggesting that errors may lie either in excess or in deficiency. The need to avoid both excess and deficiency in the allocation of finite resources is a concern in many sorts of business decisions, some with ethical implications.

### The Doctrine

In Western thought, the Doctrine of the Mean most prominently derives from Aristotle, in the *Nicomachean Ethics* (in particular II.vi.15; see e.g. Ross 1980, p. 39). In the Eastern Confucian tradition, although one of the classic “four books” was titled the *Doctrine of the Mean* in Legge’s nineteenth-century translation, the idea is more clearly present in other sources like the *Analects* of Confucius (in particular 11:16; see, e.g., Leys 1997, p. 51). In both cases, there is room for disagreement about the meaning of the idea. In Aristotle, it seems to be focused on qualities of character, such as courage or generosity, emphasizing that one can err by showing

either too much or too little of such qualities. In Confucianism, it tends rather to be associated with an idea of harmony (Sim 2007, Chap. 4).

Nonetheless, in both Western and Eastern ethics, the Doctrine of the Mean embodies the general idea that in very many contexts, the right thing to do is to aim at a mean between extremes. This is shown most vividly in the fact that both in classical Confucian texts and in Aristotle's *Nicomachean Ethics*, the analogy of an archer is used to suggest the right way to act (Yu 2007, pp. 84–8). The key thing about an archer is that unlike a runner or a discus thrower, the archer is not seeking to maximize something – speed, distance, or some other quantity – but can err by going either too far or not far enough.

The Doctrine of the Mean therefore stands opposed to consequentialist positions that see maximization as the basic requirement for ethics and morals, whether it be maximization of happiness, welfare, or something else. The Doctrine of the Mean tends to be associated with the need for developed ethical judgment or moral wisdom, like Aristotle's *phronēsis*: judgment that needs to take account of the detail of each specific context, rather than maximizing or blindly following general rules. Development of such judgment is often tied to development of good character and moral virtue, and the Doctrine of the Mean thus forms a natural part of virtue ethics.

## Business and the Doctrine of the Mean

In business, decisions both by individuals and by organizations often involve allocating resources. Often, such decisions can be thought about in terms of finding an appropriate mean between extremes. In general, any such decision has to choose between using too much or too little of a particular resource. If too little is used, the aim will not be achieved. If too much is used, resources are wasted. These may be resources of capital equipment or raw materials, or they may be human resources. Too many people and too little equipment could be one error; too much equipment and too few people another.

In many cases, resources are quantified in financial terms. Financial value may be put on

those sorts of resources or on others, such as marketing budgets or consultants' time. Once dollar values are allocated, mathematical techniques can sometimes be used to suggest optimal course of action, but the idea of finding a mean between extremes still seems to be a sound way of conceiving the problem.

So far, however, the issue seems primarily to be one of efficiency. The question remains to what extent it has an ethical dimension. While efficiency itself can sometimes be relevant to ethics, as when inefficiency leads to some people having insufficient to meet their needs, there are some other areas where resource allocation may be even more clearly an ethical issue.

## Ethical Implications: Sustainability

One area is sustainability. There has been a widespread, increasing awareness that many natural resources are finite and that there is therefore a moral responsibility toward future generations to use such resources wisely and to replace them with renewable resources where possible. It may be here that the Confucian sense of a mean as harmony has some special force. The Chinese term *zhōng* often translated as “center” or “mean” can have metaphysical connotations that are tied to the idea of *hé*, harmony, and which in modern terms may suggest the continued effective functioning of a stable ecosystem that does not deplete its resources or disrupt its environment.

## Ethical Implications: Individual Decision-Making

Another area where resource allocation may have specifically ethical implications is to do with one particular resource, the resource of attention. Human attention is certainly finite and has to be allocated to some things rather than others. Theories of management decision-making are often focused on what things to pay attention to: “theories of decision making are often better described as theories of attention or search than as theories of choice” (March 1994, p. 10). It is here that practical judgment and moral

wisdom become most closely tied to the Doctrine of the Mean. It is a very common error in decision-making to pay too much attention to some things and too little to others. At an individual level, this can be a matter of “focal bias,” in psychological terms: undue focus on some central event or issue to the exclusion of context or changing circumstances. Within organizations, it can be the result of individuals giving attention only to the matters that fall most clearly within the scope of their organizational roles, to the exclusion of other factors. It can easily result in a lack of attention to ethical implications of decisions and policies. These are the cases where members of an organization are so intent on certain outcomes, and their responsibilities for achieving them, that no attention is paid to ethical aspects of what is done.

Both Aristotle and classical Confucianism display suspicion of business and commerce, and their attitudes can be explained by a concern about the prospect of giving some things more attention than they deserve: profit, most obviously. It seems by no means necessary that business and commerce should fall into that trap, but they certainly may do so. Such undue focus on limited purposes to the exclusion of larger ends and moral considerations is what Goodpaster (1991, p. 94) has labeled “teleopathy”: pathological concentration on some unduly narrow *telos*. He contrasts it with a “*balanced* pursuit of purpose” (Goodpaster 1991, p. 97, Goodpaster’s *italics*). The phrase suggests the need to aim for a mean point, to attain some balance in the attention given to different things. For individuals, this may involve willingness to look beyond specific role requirements and more generally to remain aware of context for each decision.

### Ethical Implications: Organizational Decision-Making

For organizations, the issue may be more complex because of the possibility that within organizations decision-making processes are distributed among a number of individuals and units. As a result, there can be an even stronger tendency than with individuals for organizations to concentrate on a pre-defined range of goals and issues,

as each individual and unit has a limited range of information about the wider effects of their decisions and policies and so limited opportunity to attend to overall context and situation. Apart from the same problems that arise with regard to individuals’ own tendencies toward focal bias, there is the additional problem that individuals need to communicate with other organizational members and exchange information with them about the things they are paying attention to.

For organizations to achieve some balance in what they attend to, there is thus a need for accounting systems and reporting lines to be worked out in ways that ensure so far as possible that attention is given to a broad range of factors, including factors with ethical implications. This can be seen as one of the aims of triple bottom line reporting, designed as it is to ensure that attention is not confined exclusively to financial outcomes. Here, the idea that achieving a mean involves sustainable activity within a balanced ecosystem can be entwined with decision-making that maintains a balanced focus on all relevant considerations.

## Duplicate Publication and Salami Slicing

### Definition

Duplicate (redundant) publication is defined as “the publication, or attempted publication, of whole or substantial parts of work/data/analysis that have already been published (or have been submitted elsewhere), without transparency or appropriate declaration/referencing” (COPE Case Taxonomy 2013). This is considered a serious ethical breach that will result in sanctions if detected. Salami slicing (or salami publication) is the practice of segmenting a study into least publishable units (LPUs) for the purpose of “squeezing more papers out of a research project” (Broad 1981, p. 1137). Salami slicing is considered a questionable ethical practice because it artificially enhances the impression of the author’s work and can distort the literature with the impression that multiple studies were conducted rather than a single study resulting in multiple publications.

### What Are the Issues?

Duplicate publication is closely related to text recycling; the BioMed Central and COPE (2016) guidelines on the topic state that editors must

decide if the overlap in text and data are so significant that the paper must be retracted. A key question to resolve before issuing a retraction is whether there is sufficient new material in the manuscript to justify the new publication. If the methods, sample, outcomes, and hypotheses are the same in multiple papers, the results should not be segmented into different reports. It may not be easy to identify duplicate publications on submission of a manuscript if the authors submit multiple papers at the same time or if the submissions are made to journals in very different disciplines. Least publishable units, especially when the resulting multiple manuscripts are published in different journals, fragment the impact of the research. Given that publications are the currency by which scholars are evaluated and rewarded, falsely elevating one’s publication record can cause reputational risk for a researcher. A charge of duplicate publication can also be a violation of copyright law, depending on the copyright status of the source publication.

*Issues in scholarly publication.* For editors of scholarly journals, receiving a manuscript based on the LPU can leave unanswered questions. It is customary for the author to state that the current manuscript reports data from a larger study, but it is not always clear to readers how to interpret the relationship of the submitted manuscript to the overall scope and intent of the primary study. For example, reporting the demographics only of a large study in one paper and reporting the findings of one intervention in a second study is rarely acceptable. Due to space limitations in reporting research, elements critical to understanding the methods and results could be missed in either manuscript. Likewise, reporting outcomes at 3 months in one paper and the same outcomes at 6 months in another is not acceptable if the timeline of the study was originally supposed to be 6 months. Interim reports usually result from a researcher wanting to add another manuscript to his curriculum vitae or a need to have a publication to support a new grant request. For readers, locating parts of a single large study in multiple articles published in different journals is time-consuming and cumbersome.

Research reporting clinical trials of new drugs or devices may be at particular risk of

misinterpretation when interim reports are issued. Conducting clinical trials is difficult and time-consuming, but it is an essential part of the approval of new therapies. When such trials are funded by international companies, there are likely to be several locations where the research is conducted, and each of those sites has an interest in reporting their results. If the authors are not completely transparent in reporting their results as part of a larger study, each study could be interpreted as separate and thus inflate the impression that multiple studies were conducted. All clinical studies have several shortcomings: they vary in their ability to control for confounding variables; they are based on samples of a target population; study subjects may alter their normal behavior simply because they are being observed (the Hawthorne effect); study samples exclude subjects based on age or other variables that can affect outcomes; few studies follow subjects for an extended period of time. One method to overcome these limitations is to combine multiple studies into a single systematic review and meta-analysis. Conducting a meta-analysis requires strict procedures to assure that the pooled sample does not count individual subjects more than once. The Cochrane Library is a trusted source of systematic reviews and meta-analyses in health care. The Cochrane group has developed standard processes and procedures for conducting, updating, and disseminating reviews (<https://www.cochrane.org/about-us>).

There are legitimate reasons for reporting findings from one large study in more than one manuscript. Frequently, quantitative results are reported separately from the qualitative findings on the same subjects. Qualitative methods are sufficiently different from quantitative methods that the results would not be pooled in one sample for a review and analysis, and the methodologies require different reporting parameters. Including a substantive report of two different methodologies for the quantitative and qualitative approaches would make an article excessively long. Another common and acceptable practice is reporting the research in one article and writing clinically-focused articles for different audiences. In all cases, the article should be completely transparent about where the primary results are reported and

clearly state the function of the clinical article to apply the findings to a specific setting. An example of this might be reporting the findings related to pharmacokinetic and pharmacodynamic explanations of an investigational drug in different populations in a journal read by pharmacologists and reporting the clinical outcomes of the study in a medical journal. It would not be ethical to report the same findings as primary outcomes from a study in a pharmacy journal and a medical journal; that would likely be considered a duplicate publication.

Manuscript submissions are screened by editors to determine suitability of the topic for the journal and to look for any significant problems such as plagiarism in the manuscript. Even if each manuscript is submitted to a plagiarism detection program, those programs compare the submission to the published literature. When authors submit the identical, duplicate, or fragmented report simultaneously to several journals, plagiarism or similarity among the submitted papers will not be detected. It is only after publication that this misconduct becomes apparent. Similarly, a translation of a study from a publication in another language by another author is rarely detected prior to publication unless a peer reviewer happens to know of the original study. This does happen but is a result of pure chance. Following publication, readers who are fluent in another language bring the misconduct to the attention of the editors.

*Reputational issues.* Academic advancement is based on several criteria, one of which is authorship on published papers. If an author can produce multiple papers out of one study, that translates to several entries on the author's curriculum vitae under publications. When it is unclear that the papers are derived from one sample or when there are multiple authors on each paper, this raises suspicions (Broad 1981). Credit and recognition are often accorded based on position of authorship, rather than effort or percent of work done. Salami publication does not always enhance the reputation of a scholar or improve prospects for job acquisition or advancement. Editors are also wary of new submissions from authors who in the past have sliced research into LPUs.

When duplicate publication is detected on submission, the result is rejection of the manuscript and a cautionary note from the editor about the ethical lapse. When a duplication is detected after publication, the remedy is a public retraction of the published paper, which may cause damage to author's reputation.

## Economic Efficiency and Socioeconomic Well-Being

### Introduction

Economists have largely focused upon economic growth as the fundamental engine for improving the well-being of individuals. And, well-being has been largely measured by the level of real gross domestic product (GDP) per person or per capita. Real GDP is the money measure of GDP adjusted for price changes. GDP is the most widely used measure of legally produced marketed output in an economy. The growth in per person real GDP is the most widely used measure of the improvement to well-being. The assumption being made here is that per capita real GDP is a simple but fairly reliable proxy for socioeconomic well-being. This follows from the further assumption that the level of GDP and growth of real GDP will have a positive effect on the population as a whole and

will invariably positively impact on poverty reduction, health outcomes, and educational outcomes as well as even the level of happiness.

Typically attached to this narrative is that more income equality tends to damage the prospects of economic growth, especially for the less economically advanced economies, which still represents a large segment of the world's population of just below eight billion individuals. Nearly three billion of these reside in China and India. More equality, it is assumed, reduces the savings of those who it is assumed save most – the wealthiest members of society. It is further assumed that their savings are invested and not spent on conspicuous consumption or transferred abroad (Baran 1957). These are not empirically fortified assumptions. From a policy perspective, causality is suggested going from income inequality to more economic growth to higher levels of well-being. And, it is the economic growth thereby generated that will improve the well-being of a large segment of the world's population. However, the evidence suggests that increasing income inequality is not necessary for enhanced economic growth. So, one can increase per person real GDP without increasing income inequality (Cingano 2014). Even where there is a positive statistical relationship between economic growth and more income inequality, the evidence suggests that economic growth and, therefore, well-being levels would have been greater with more income equality. Modeling increasing inequality as a positive contributor to economic growth also assumes that

more inequality would not affect the level of economic efficiency. There is no evidence that this assumption is valid. There actually is evidence that more income equality positively affects growth by positively affecting productivity. Related to this, one can hypothesize that more income equality (up to a point) can positively impact on the level of one type of economic efficiency – the level of x-efficiency, discussed below.

### **Economic Growth, Economic Efficiency, and Well-Being**

One important determinant of real GDP growth is economic efficiency. Therefore, one point of focus in efforts to improve socioeconomic well-being should be on enhancing economic efficiency. All other things being the same, increased economic efficiency should translate into higher levels of socioeconomic well-being. It is therefore important to specify what is meant by economic efficiency and how this feeds into a better understanding of economic growth.

Although the links between economic efficiency and the levels and the growth of per person GDP are clear (it increases productivity), what requires clarification is how per person real GDP contributes to improvements to a population's socioeconomic well-being. It is also important to better understand the extent to which economic efficiency can be a significant contributor to economic growth and, therefore, potentially, to socioeconomic well-being. But there is no reason for real per person GDP to automatically translate into well-being improvements across the entire population as opposed to being concentrated among only certain segments of the population, such as the wealthiest income cohorts. Much depends on who benefits from economic growth – the transmission mechanism from growth to the well-being of each and every member of a particular society. However, the evidence strongly suggests that economic growth and one of its important determinants, economic efficiency, are key determinants of the realization of widespread improvements to well-being.

There has been an increasing interest in the relationship between per capita real GDP and the level of subjective happiness (how happy are you on a one to ten scale?). In spite of challenges to the hypothesis that money can buy happiness, the most recent empirical analyses strongly support the hypothesis that increasing per capita GDP is strongly and positively related to the level of happiness. But there is significant variation in this relationship (Altman 2016; Easterlin 1995; Deaton 2008; Kahneman and Deaton 2010). There are countries with a lower level of per capita GDP that have higher measured levels of happiness than countries with a higher level of per capita GDP. This can be explained by the distribution of income and also how government spends its share of the growth dividend. The growth of per person GDP is also strongly and positively related to improvements in other measures of well-being.

Figure 1 illustrates the relationship between per person or per capita real GDP and the Human Development Index (HDI), which was developed by the United Nations as a supplement to GDP per capita as a proxy measure for well-being. The HDI includes per person GDP as well as measures of life expectancy, literacy, and educational enrolment. There is a clear positive relationship between per person GDP and the HDI. To achieve the highest levels of HDI one must also realize the highest levels of per person GDP. But it is also clear that for any given level of per person GDP there is an array of levels of HDI. The level of achieved HDI depends not only on per person GDP, but also on other factors such as who benefits from increases to per person GDP and how government spends or invests its share of any increase in per person GDP. One classic example of this is there are a large number of countries with lower per capita GDP than the USA, who have achieved higher levels of HDI.

Figure 2 illustrates the relationship between the percentage share of a country's population living in extreme poverty and the level of per person GDP. Here there is even a stronger and tighter statistical relationship between these two variables than between per person GDP and the HDI. To achieve very low levels of extreme

poverty one must realize relatively high levels of per person GDP. In the wealthier countries there is hardly anyone living in extreme poverty (but relative poverty still exists, which is another issue). But one should also note that there is very significant variation with respect to the percentage of the population living in extreme poverty and per person GDP, especially among the relatively poorer countries in the world. For example, China and Thailand are relatively poor, but they have achieved very low percentages of their population living in extreme poverty as compared to some countries with higher or equivalent levels of per person GDP. As with respect to the per person GDP-HDI comparison, much depends on who benefits from economic growth (the distribution

of income) and what government does with its share.

## Economic Efficiency

The economic literature tends not to focus of economic efficiency as a major determinant of the level of per person GDP or in its rate of growth. Rather, there is a focus on capital available per unit of labor and technological change. Although increasing capital (incorporating land) serves to increase productivity, it is subject to diminished returns. It can't deliver sustained growth over time and tends to be of greater consequence in the earlier stages of the development process. However, an overriding importance of

investment in capital is that it embodies new technology. Technological change has been shown to be the key contributor to the growth of per person GDP, at least in the more developed economies. And, technological change remains of some consequence in other economies as well. These estimates assume that economic entities (such as firms and farms) are operating in an economically efficient manner. It is this latter assumption that has been challenged in the literature, with important implications for a better understanding of the role played by economic efficiency for real per person GDP growth. If economies are inefficient, then improving economic efficiency is an additional factor, along with capital per worker and technological change that contributes to the growth process.

Economists tend to focus on allocative efficiency when discussing economic efficiency. The former is defined as the optimal allocation

of resources, which is achieved when prices are not distorted by movements away from perfectly competitive markets or by government interventions in the economy which might distort relative prices. Since real world economies are not perfectly competitive and governments have, at times, distorted relative prices, there should be some allocative inefficiencies whereby resources are misallocated yielding a lower than possible level of per person output. But the evidence suggests that allocative inefficiencies and their correction would not contribute much to economic growth (Leibenstein 1966; Frantz 1997). This being said, improvement in allocative efficiency can contribute to improving well-being through its positive effect of real per person GDP. However, what Leibenstein (1966) refers to as x-efficiency, a form of production efficiency, can contribute significantly to high levels of per person GDP and to higher levels of its growth. This

can generate higher levels of well-being. But the distribution of this increase in well-being depends upon on the process by which this increase in x-efficiency is realized.

It is important to note that other approaches to economic efficiency that focus on reducing labor inputs or cutting labor benefits will reduce the level of well-being of the target population. Also, an organization or firm leaders who engage in these types of efforts to improve efficiency often focus on the short run, whereby efficiency might be increased in the short run, but decreased in the long run. Organization leaders who are more forward looking assume that cutting labor benefits will not negatively impact on productivity and that cutting inputs (firing staff) will not negatively impact on productivity. If this assumption does not hold true, attempting to achieve higher levels of inefficiency in this manner might either not impact on efficiency or might actually reduce productivity. This would negatively impact on the well-being of the overall population.

X-inefficiency exists when productivity is lower than it can be given traditional factor inputs (labor, capital, land) and given technology. A key cause of x-inefficiency is lower levels of efforts in terms of quality and quantity than would be possible from employees and employers who were interested in maximizing their firm's productivity. Conventional economics assumes that effort per unit of labor is fixed and fixed at some maximum. Therefore, from this theoretical perspective x-inefficiency can't exist. But given the importance of x-inefficiency, how one increases the level of x-efficiency can positively impact on well-being.

There are different ways of increasing the level of x-efficiency. Economists have tended to focus on broad averages when converting improvements to productivity to improvements in well-being. But this makes the simplifying and incorrect assumption everyone benefits in some significant way from increases in productivity. One way of increasing productivity through increasing the level of x-efficiency is to incentivize management to work smarter and harder. In this case, if productivity increases as a result of management's

income rising and there is no flow-through to employees, well-being increases for management, but for no one else.

Evidence suggests that a more effective and sustainable method of increasing the level of x-efficiency is to incentivize all firm members, employees, and employers alike, to be more productive through increases in quality and quantity of their effort inputs. Managerial change and, more broadly, organizational change are required here, but this is in the context of a more cooperative and collaborative work environment. A key point here is that by increasing the level of x-efficiency in this manner, employees clearly benefit, which would facilitate increases in their level of well-being. And, from this modeling perspective there is no reason for employers (including managers) not to benefit as well. But it is the improved benefits to employees that contribute to incentivizing employees to work smarter and harder. At a macroeconomic level, this plays out into a more equitable economic growth path. Overall, how economic efficiency is achieved is fundamentally important in determining who captures the resulting increases in revenue and this affects the distribution of well-being improvements across the population.

A practical example of this more equitable x-efficiency growth path is in the important agricultural sector which, according to the FAO (Food and Agriculture Organization), contributes over 60% to world employment, but less than 10% to world GDP. This sector remains relatively low productivity in the developing economies of the world. But when farmers (small landholders, such as in China, post-Cultural Revolution) are incentivized to be more productive, such as providing farmers property with rights to their farm and output, this serves to increase their farms' level of x-efficiency. Where farmers control their output and its derived revenue, this increase in efficiency is to a significant extent captured by farmers and serves to increase their well-being and that of their families. A similar scenario arises when smaller landholders form cooperatives (member-owned organizations) to obtain scale economies and to garner more control of the revenue that they generate. This can further incentivize further

increases in the level of x-efficiency in a manner that yields a more equitable distribution of benefits.

The level of x-efficiency can also impact on the extent of technological change. Certain productivity enhancing technologies might be only profitable at a certain higher level of x-efficiency. Moreover, such more productive technologies can be induced by higher costs, such as increased employee benefits or the desire for a higher standard of living among farm families residing in family farms. These increased costs can both incentivize higher levels of x-efficiency and technological change. This pathway to increase economic efficiency yields more economic benefits to a wider array of firm members and therefore a more equitable distribution of improvements to well-being. This is a product of this type of technological change being incentivized by improved benefits accruing to employees (and farm families).

## Conclusion

Of the two main types of economic efficiencies, it is employee benefits-induced improvements to economic efficiencies that stand to generate the most assured and equitable improvements to well-being. This relates to increases in the level of x-efficiency. It is this type of efficiency improvement that lends weight to the argument that increasing real per person GDP growth will enhance the well-being of the population as whole, of all segments of the population. Improvements to allocative efficiency has the potential to improve, somewhat, the well-being of all segments of the population since it contributes to increasing the level of per person real GDP. But there are no guarantees. Much depends on the distribution of income and, relatedly, the bargaining power of labor, as well as how government invests its share of any increase in per person GDP that it captures through taxation. Overall, increasing per capita real GDP has played a vital role in improving the well-being of the world population. Improvements to

economic efficiency, especially x-efficiency, play an important role here, especially when combined with x-efficiency-induced technological change.

## Economic Man

Thomas F. Phillips  
Trent University, Peterborough, ON, Canada

## Synonyms

Homo economicus; Profit-maximizing firms; Rational economic man; Utility-maximizing consumers

## Definition and Introduction

The term “economic man” is narrowly defined to refer to the rational economic agents – producers and consumers – that are in orthodox theory the basis of a capitalist economy. The term *rational economic man* is often used in contemporary economics; less often used, but equally as relevant, is the term *homo economicus*. *Economic man*, *rational economic man*, and *homo economicus* are synonymous. The oldest form has its origins in the term *homo economicus* that can be traced to Maffeo Pantaleoni (1889) and subsequently and notably used by Vilfredo Pareto (1906) and Adolf Lowe (1935) (O’Boyle, 321–2). *Economic man* has often been attributed to J. S. Mill; however, Mill did not use the term in his work. As Persky (222) points out, it was J. K. Ingram in his critique of Mill who first referred to *economic man* when he wrote that Mill “dealt not with real but imaginary men - ‘economic men’ . . . conceived as simply ‘money-making animals’” (Ingram (1888), 218). The term *rational economic man* has also often been associated with the philosophical and economic critique of the concept by Hollis and Nell (1975).

## Evolution of the Term

The term *economic man* was used sparingly until the 1970s when it became commonly used to refer to narrowly defined rational economic agents – self-interested, independent individual consumers and producers. This was coincidental with Neoclassical economic theory becoming the mainstream economic doctrine of the latter half of the twentieth century and into the twenty-first century. Neoclassical theory, with its utilitarian roots, describes its agents as having common, innate characteristics that make them *economic men*. Like the taxonomy of species in biology, from the Neoclassical point of view, these common – asocial, ahistorical, apolitical – characteristics make them members of the “economic species,” *homo economicus*, where all members are powerless, classless equals.

There are some aspects of the interest in *rational economic man* as *homo economicus* in the latter-half of the twentieth century. Characterizing all economic agents as members of the “economic species,” *homo economicus* implies that their behavior – economic behavior – is like the biologically determined characteristics of *homo sapiens* – that is given, not socially acquired. This enabled Neoclassical economic analysis to analytically mimic biology, chemistry, and physics within the social sphere (Mirowski 1989).

While there is a clearly defined species named *homo sapiens* within the biological taxonomy, *homo economicus* is an abstract notion created by economists to describe economic agents, most often within the Neoclassical theoretical tradition. Neoclassical economists “work with a notion of abstract individuals, who choose among abstractly described alternatives” (Hollis and Nell, 1). Thaler offers that “many aspects of the standard [*homo economicus*] model are useful as theoretical special cases . . .” (Thaler, 137). While there is some recognition of the behavior of agents in the classical tradition of economics – e.g., the role of self-interested, profit-maximizing capitalists in Marx’s analysis – *economic man* does not play the central role it plays in the Neoclassical tradition.

Neoclassical economics clings to a prescribed version of rationality inherent in its agents; however, recent research of actual behavior, especially from psychology, has demonstrated that the orthodox version of rationality is more than an abstraction; it is an idealization that has little bearing on actual behavior.

With *homo sapiens* sustaining themselves through noncapitalist, social systems of production and distribution (i.e., social systems based on tradition rather than markets) long before the emergence of capitalism, it is worth noting that the notion of *economic man* was introduced only when the utilitarian-based description of the underlying forces of capitalism emerged. “It has been suggested that *homo economicus* produced capitalism, meaning roughly that human nature being what it is, the evolution of the capitalist

rules of the game is both likely and desirable. But this may be backwards, or at least one-sided; one could equally argue that capitalism produced *homo economicus*” (Bowles and Gintis, 96–7). Nevertheless, contemporary, mainstream, Neo-classical economic analysis relies heavily on its notion of *economic man*.

## Introduction

Economics is the science of allocating scarce resources among competing ends (Dorfman and Dorfman 1993). It studies how and why individuals and groups make decisions about the use and distribution of valuable human and nonhuman resources (Field and Martha 2002). Economics can be categorized into positive economics – which is the study of what is – and normative economics, which is the study of what ought to be (Field and Martha 2002). Positive economics seeks to understand how an economic system actually operates by looking at the way people make decisions in different types of circumstances. It is objective in nature and can be verified. For instance, if we say that reducing land pollution from agricultural chemicals by adopting organic farming will increase production and number of species by an average of 20–25% over the next 3 years, this is an exercise of positive economics. Normative economics focuses on value judgments or opinions of how things should be. It is subjective in nature and is not subject to direct verification. For instance, if we opine that consumers can push companies to reduce land pollution from agricultural chemicals by reducing consumption or usage of a polluting product, that is normative in nature and an example of normative economics.

Ethics is a branch of philosophy which consists of moral principles that define what is right and

wrong for individuals and society. Ethical theory presents logical, defensible, and coherent arguments why one course of action or behavior is to be morally preferred over another. However, the lack of social consensus on what constitutes right or wrong calls for constant examination of moral values and searches for those that are reasonable, rationally defensible, and universally accepted. In business or any professional field, ethics play an important role in examining the ethical or moral principles and providing direction when dealing with complex organizational ethical dilemmas.

Environment generally refers to what constitute our human surroundings. The environment, in the context of economics, is viewed as a composite asset that provides a variety of services (Tietenberg and Lewis 2010, p. 15). Examples include land, water, air, animals, plants, etc. Human beings exist by relying on resources provided by the environment to satisfy their wants and needs. These resources are scarce and should be allocated in the most effective and efficient manner to maximize human satisfaction. However achieving that optimal level is a challenge because environmental resources are scarce, yet environmental resources are treated as public and/or common goods, meaning a resource from which all may benefit (Kollock 1998).

## Environmental Economics Versus Environmental Ethics

Environmental economics, considered as a sub-field of economics, has gained popularity since the early 1970s due to rising environmental problems. Environmental economic issues are often of an ethical nature. Environmental problems are interdisciplinary in nature and require a multi-dimensional approach (Sunstein 2005). The question is: “how do we allocate scarce natural resources or regulate human actions toward the environment in the most efficient and effective manner to achieve the common good?” Answering this question calls for moral thinking in/by the incorporation of both positive and normative economic perspectives (see Hausman and McPherson 1993, 1996; Sen 1999; Vickers 1997).

A good example that explains the social dynamics underlying many environmental challenges is presented by Garrett Hardin (1968) in an article in science titled “The Tragedy of the Commons.” The essay tells the story of how the management of a communal pasturage by a group of herdsman turns into an ecological disaster when each individual, upon realizing that adding extra cattle benefits him personally, increases his herd, thereby unintentionally causing the eventual destruction of the commons altogether (Hardin 2009; Ostrom 2008; Van Vugt 2009).

Actions such as cluttering the environment with wastes, disposing pollutants into rivers and lakes, emitting fumes and smoke in the atmosphere, or noise and smell nuisances seem free, as no one is individually responsible to pay, but are not without consequences to those who reside within that environment. At least in the short to medium term, destructive users of natural resources gain the benefits of their use by default (Olson 1971; Nordlund and Garvill 2003).

One way of dealing with the overuse of environmental resources is through the use of economic analysis of environmental policies. Policies, for instance, for dealing with issues such as land, air, and water pollution, biodiversity protection, energy regulation, climate change, management of natural and renewable resources, and waste management now mostly rely on positive economics. The design of environmental policy requires answering two central questions: what is the desired level of environmental protection? What policy instruments should be used to achieve this level of protection (Keohane et al. 1998)? Despite the use of policies that impose legal recourse and government intervention to regulate actions, they have not been entirely successful because it is hard to identify the persons responsible or to prove it in the court of law. A central issue is whether environmental policies in the positivist, neoclassical sense are sufficient to deal effectively with natural resource utilization or whether there additionally needs to be some form of moral obligation to curtail elicited use of these resources.

Opportunistic behavior can be regulated through voluntary adoption of environmental

ethical standards. The use of environmental resources can be based on the idea that the natural environment is of purely instrumental value to human beings alone and should be used accordingly or on the idea that the natural environment is noninstrumentally valuable, meaning that it is valuable in its own right and independent of any benefits it confers on human beings only (Booth 1994). For instance, a forest can be preserved because it is morally the right thing to do and because of its continuing usefulness to human welfare by providing clean air, preventing soil erosion, and providing habitat for animals who are a source of food for humans. Human individuals in this situation would be willing not only to defend the existence and well-being of one another but nonhuman natural entities as well and to defend them for their own sake, not for the instrumental value they deliver (Booth 1994).

The following examples indicate how economics and ethics can interact to solve environmental issues:

### **Cost-Benefit Analysis (CBA) and the Environment**

The increasing demands which society places on the natural environment call for different approaches to setting environmental standards. One way is through cost-benefit analysis (CBA) of estimating the monetary costs of environmental degradation so that they can be compared with the benefits of environmental protection (see Pearce 1971; Robinson 1993; Hanley and Spash 1993; Sunstein 2005).

Take the example of an oil refinery industry built to drill and refine oil. On one hand, the industry will provide jobs, boost infrastructure, and be a source of revenue to the government; on the other hand, it causes air and water pollution which threatens the lives of many people and animals in the area and negatively impacts with climate change. When the drilling for oil is done, the land will have been damaged and lost its value. Some of the damages on the environment will have long-term effects or be irreversible.

This is the ethical dilemma that confronts environmental economic issues. The question is how to determine what counts as a benefit and what

counts as a cost. Are benefits seen in terms of monetary value – jobs, infrastructure, or revenue the refinery generates for itself and the community – or non-monetary values in terms of happiness, good health, and intergenerational equity that accrues to society as a whole?

From the positive economics point of view, CBA demands that the advantages and disadvantages of a regulatory policy be analyzed, as far as possible, in numbers, and then further converted into monetary values of dollars and cents (Ackerman and Heinzerling 2002). This implies that in the example above, economists will look at how much revenue the refinery generates and the costs of production, for example, in the use of techniques for protecting human health and the environment through the use of pollution control devices. However, Ackerman and Heinzerling (2002) contest that such approach does not work well with government policies, regulations, and public spending because they do not face the test of the marketplace where the benefits to consumers are measured by consumers' willingness to pay for them, while they add significantly to the costs of production. Furthermore, it is often not possible to quantify qualitative aspects of risks society faces due to toxics in food, contaminants in drinking water, and effects of climate change.

A complimentary approach to CBA is called for that considers the welfare of society and not just monetary value. Freeman (1993, p. 7) poses that "society should make changes in environmental resource allocation only if the results are worth more in terms of individuals' welfare than what is given up by diverting resources and inputs from other uses." From a normative economics point of view, CBA aims to guide the decision-maker into channeling resources into projects which will yield the greatest gain in net benefit to society (Pearce 1971, p. 18). With regard to the environment and normative economics, it means that while each is responsible for their own self-development, we all have a duty to promote the happiness of others insofar as we do not impair our own ability to develop as human individuals (Booth 1994). In our example, it implies that the issues of health, happiness, and equality are

equally important to job creation, revenues, and infrastructure that the oil industry provides.

The deontological Kantian ethical approach that is consistent with the normative welfare economic framework for analyzing environmental problems states that individuals have a moral responsibility not to reduce the ability of others to seek happiness by damaging features of the natural environment instrumental to such happiness. He further argues that although damage to the environment cannot be ruled out, those who suffer as a result of this can be compensated for their losses in some fashion that would permit them to obtain an equivalent level of happiness by other means (Booth 1994).

Johansson-Stenman (1998) argues that policy recommendations of any kind should have some ethical foundation and that any specific action recommended to be undertaken should have some ethical motivations behind *why* we think it is good. He expounds that the costs and benefits to be included in welfare-oriented CBA are also intrinsically value-laden since these are *derived* from a social objective, which by definition must be ethical in nature (Portney 1992). Economists and moral philosophers since Adam Smith have observed that competitive market economies operate far better where shared values of honesty and integrity prevail than where they do not (Jones 1995, p. 12).

### Game Theory in the Form of Prisoner's Dilemma and the Environment

According to Sen (1999), the complex structure of "self-interested behavior" has three distinct and essentially independent features: *self-centered welfare* where a person's welfare depends only on his or her own consumption; *self-welfare goals* where a person's goal is to maximize his or her own welfare; and *self-goal choice* where each person's act of choice is guided by the pursuit of one's own goal. Such complex structures, especially when dealing with major issues of cooperation between economics and social matters pertaining to the environment, can be looked at in terms of game theory such as the prisoners' dilemma (see Shubik 1970; Hardin 1971; Dawes 1991; Nordlund and Garvill 2003).

The original dilemma involves two prisoners who are separately and without knowledge of the other's decision, given the choice between testifying against the other or keeping silent (see Luce and Raiffa 1957). It has been applied analytically in various fields.

Sen (1999, p. 82) explains that in prisoner's dilemma game, each person has a "strictly dominant" individual strategy in the sense that no matter what others do, each person's own goals are better served by following that dominant self-goal strategy. At the same time, everyone's goals would have been, respectively, better served had they followed a different and more cooperative strategy. Given a "self-goal" choice, each person will follow the noncooperative strategy, and thereby everyone will end up in a situation inferior in terms of payoffs to following a cooperative strategy. Such noncooperative individual choices have negative collective consequences that tend to accumulate until individuals are faced with a situation in which everyone would have been better off had they chosen to cooperate (Nordlund and Garvill 2003).

The prisoner's dilemma with regard to environmental issues is more of a social game that offers choices in social dilemmas involving individual and collective interests. It offers the choice of whether individuals should pursue their own interests because this leads to higher individual outcomes (at least in the short term) or should act together in the interest of the collective since everyone will be better off in the long run if everyone cooperates (Nordlund and Garvill 2003).

Using the example of air pollution, the options to cooperate and not to cooperate would become, to not pollute (cooperate) or pollute (not cooperate/defect), respectively. The optimal outcome would be for both players to cooperate and not pollute resulting in a cleaner air that benefits everybody. However, that option is not in optimal equilibrium because one would be better off by not cooperating and letting other people "clean the air" for him/her. This results from the commonly held assumption that one person's actions don't make a difference and is the reason that the final equilibrium is always the suboptimal option (both players end up polluting) ("Prisoner's Dilemma and the Environment 2012").

Jones (1995) supports Pruitt and Kimmel's (1977) comment that human beings, as subjects in behavioral experiments, also settle into mutually cooperative modes in iterations of the prisoner's dilemma game, albeit often only after several instances of non-cooperation on the part of one or both players. Eventually, the poor outcomes resulting from noncooperative strategies induce most people to cooperate. Jones (1995) concludes that human beings can be induced to make choices that are efficient in the long term, even though short-term self-interest seems to dictate beneficial outcomes. Axelrod's (1984, p. 110) prisoner's dilemma instructs us that when dealing with the ethics of environmental usage, individuals should (a) not be envious, (b) not be the first to defect, (c) reciprocate for both cooperation and defection, and (d) not be too clever by trying to maximize purely self-interested payoffs (Kollock 1998).

## Economics and Business of War and Responsibility for Unjust Wars

J. Angelo Corlett

Philosophy & Ethics, San Diego State University,  
San Diego, CA, USA

### Introduction

Wars, whether or not they are morally justified, require economic support. And if the war is justified, then businesses supporting such wars might be worthy of moral praise, contingent on the manner(s) in which they supported such war efforts. But if a war is not morally justified, then generally businesses supporting it are morally liable to blame and even responsible to be legally punished being that they are contributory causes of, or at least supporting, its untoward damages to the victims of the war. Moreover, wars can be unjust contingent on the extent to which they fail to satisfy conditions of a just war, and this holds true even if the cause of the war is just. Generally, for a war to be a just one, it must satisfy both the just cause (*jus in bello*) and justice during war (*jus ad bellum*) conditions of a just war.

Given that significant participation in an unjust war is itself a crime of war, then those who do so must be held accountable to the extent that they do so with intent, knowledge, voluntariness, etc., whether they are individuals or businesses. Just as Volkswagen and various other businesses supported the Nazi war effort during what eventuated in WWII, so too can certain US-based businesses and certain individuals in them be rightly held accountable for their economic or administrative support of unjustified military efforts of the US. However, what is required is a statement of the basics of just war theory in order to know the conditions both necessary and sufficient for a business responsibility for its economic support of a war effort (Corlett 2014).

It is important to note that the basic economic support for war comes from at least two sources: From the taxation of working citizens and from

businesses which can and are willing to contribute to the war effort. Without the taxation of individual citizens, it would be difficult, if not practically impossible, to compete in war, and because of the absent contributions of certain kinds of business industries, the machines or weapons of war would not be available for use by soldiers. These facts are morally neutral. The winning of a just war is not possible or likely without such support, and the winning or losing of an unjust war is not likely or possible without them either.

The economics of war is not, however, all about supporting war efforts, be they justified or unjustified ones. When wars are unjustified, reparations are owed to the victims of it. Those who are most responsible for the causing or sustaining of an unjust war owe substantial reparations to the victims of the said war. And, while reparations are in at least two forms, compensatory and non-compensatory, the focus herein shall be on compensatory reparations for unjust wars.

### Just War Theory

The particulars of just war theories are indeed hotly debated in academic circles. While the history and particulars of just war theories are rather complex, it will suffice for purposes of this brief article to summarize some of the major points of the tradition in order to provide a means by which to judge the moral status of a particular act of war or military attack. My aim is rather focused: I want to know what is required of a just war or military attack, and whether or not and how those responsible for it (be they individuals or businesses) should be punished, and why. By “punished” and its cognates is meant hard treatment or being forced to compensate victims of serious harmful wrongdoing, in this case, in the course of war. Thus, the “economics and business of war and unjust wars” in this article is multifold as it refers to those who are primary responsible agents in the causing and sustaining of unjust wars or other military conflicts, on the one hand, or to those who are punishable and/or owe compensation for their responsibility for the said wars, on the other hand.

Well-ordered peoples have no right to war in pursuit of their own interests that are unreasonable. There is only a right to war (*jus in bello*) in self-defense in order to protect and preserve peoples' own basic freedoms and constitutionally democratic institutions against attack from non-well-ordered or outlaw states. War is never justified in order to gain economic wealth or natural resources, power, or empire. These are reasons, however, unreasonable, for outlaw states to go to war. Reasonable and well-ordered peoples have a right to war only in self-defense because they honor human rights and are nonaggressive (Rawls 1999). In other words, the only just cause for going to war is self-defense of human rights, or the defense of others is dangerous of having their human rights violated.

When it comes to justice during the conduct of war (*jus ad bellum*), assuming a just cause for the war, the following considerations are vital. The aim of a just war waged by a well-ordered state is a lasting peace among peoples, including the society with which it goes to war. Well-ordered societies do not war against each other, but only against expansionist non-well-ordered states threatening the basic rights of other states that lead to war in the first place. It is important to distinguish between political leaders, soldiers, and citizens when determining parties responsible for war crimes. Since outlaw states are not well-ordered, citizens are not those who caused the war. Moreover, wars are caused only by leaders and those who influence them to war. They are war criminals when they cause an unjust war and they are responsible for it. Citizens are not responsible for the war even if they enthusiastically support it. They often, if not always, do so out of critical ignorance of its underlying causes. Soldiers do not cause the war and are not responsible for it. Well-ordered peoples must respect human rights even with regard to enemy civilians and soldiers, for such enemies have human rights, among them the right to not be treated indiscriminately. This implies the moral unjustifiedness of the atomic bombings of citizens (noncombatants) of Hiroshima and Nagasaki in retaliation against the Pearl Harbor attacks which was made against military targets only and the allied forces'

bombing of Dresden in retaliation against Nazis' carpet bombing of London in WWII (Rawls 1999).

The considerations of the previous two paragraphs serve as a reminder that the complexities of war are such that even in a morally justified response to unjustified war concerning the *jus in bello* condition of just war theory, factors of *jus ad bellum* may constrain our praise for the defeat of an evil enemy which began the unjust war. That the allied forces were justified in providing a military response to the aggressive Nazi regime does not imply or otherwise support the idea that the allies were justified in targeting civilian (noncombatants) even though the Nazi's began to do so before the Allied forces did. Unreasonable or unjustified evil is neither a reasonable nor justified response to unreasonable or unjustified evil. A more justified response would have been to issue and enforce an announcement to the Nazi leadership that every civilian target by the Nazis would result in the gruesome and torturous killings of twice the numbers of Nazi leaders. Given the basic mathematics of the ration of Nazi officers to European civilians, this would imply that from that moment on after the carpet bombings of civilians of London, each Nazi officer would be hunted down and tortured to death if they were found guilty of war crimes at Nuremberg.<sup>1</sup> As war criminals, at least most of them deserved death. Given the degree to which they were co-responsible for WWII and its horrendous evils, to express qualms for their being tortured to death (assuming this was done post the Nuremberg trials) would be to engage in a kind of dogmatic pacifism unworthy of serious consideration. For the co-responsibility of the said officers, considerations of proportionate punishment and the harms they inflicted on others imply the desert of such hard treatment. Assumed here is the idea that

<sup>1</sup> This suggested war policy is an ironic twist on the policy of the Nazi regime in various countries across Europe promising to kill several civilians of those regions for every Nazi officer who was targeted by them. While the Nazi policy was indiscriminate in targeting civilians, this policy is not insofar as it targets only Nazi military combatants.

such Nazi officers satisfy to some meaningful extent the conditions of responsibility for their actions, omissions, or attempted actions, as the case may be.

## Compensatory Justice for War Crimes

What are compensatory reparations and why are they important? *Reparations*, according to the seventh edition of *Black's Law Dictionary*, involve "payment for an injury; redress for a wrong done." They are payments "made by one country to another for damages done during war." Reparations involve restitution, which is the "act of restoring . . . anything to its rightful owner; the act of making good or giving equivalent for any loss, damage or injury; and indemnification . . . A person who has been unjustly enriched at the expense of another is required to make restitution to the other."<sup>2</sup> Reparations involve restitution, which is the act of restoring something to its rightful owner and the act of making good or giving equivalent for a loss, damage, or injury. One who is unjustly enriched at the expense of another owes reparations to the injured party. As Joel Feinberg states, "Reparations 'sets things straight' or 'gives satisfaction' . . . for redress or injury" (Feinberg 1970: 74–75).

The importance of reparations is complex. The economic value of reparations is that groups which have been wrongfully and seriously harmed are restored (however approximately) to their previous economic status so as to suffer them no undue financial burden. The political value of reparations is that the wrongfully harmed group retains or justifiably enhances its political power within a larger society, which in turn can have an effect on how the law functions in that society. The social value of reparations is that it respects the compensatory rights of groups so that they suffer no further undue social disadvantage. And

the moral value of reparations is that they support a system of rights which protects individual and collective autonomy and allows groups and their respective members to be able to predict when they ought to suffer conflict with legal, social, or political authorities. In other words, reparations provide a means to effect peace between parties, one of which has been unduly harmed by the other. In so doing, reparations can serve to support morally just political and legal institutions.

Moreover, reparations serve to protect the rights of those groups which would suffer at the hands of harmful wrongdoers. In so doing, reparations have a complex expressive function which is similar to the expressive functions of punishment articulated by Feinberg (1970). Like punishment, reparations disavow the harmful wrongdoings committed and state that the harmful wrongdoers had no right to perform such wrongs. Moreover, they, like punishment, state publicly that such harmful wrongdoings do not represent society's highest aims and aspirations. In democratic societies, reparations speak in the name of the people against such harmful wrongdoings, upholding the genuine standards of law in the face of past failures of the legal system to carry out true justice.

Furthermore, like punishment, reparations seek to separate a reasonably just society from its corrupt history, absolving it of at least some of its historic evils. Also, as Feinberg states about the expressive function of punishment, reparations "can express sympathy, benevolence, and concern, but, in addition, it is always the acknowledgement of a past wrong, a 'repayment of a debt,' and hence, like an apology, the redressing of the moral balance of the restoring of the status *quo ante culpum*" (Feinberg 1970: 76). More generally, the expressive function of reparations is to make public a society's or organization's own liability concerning the harmful wrongdoings it has wrought on a group. It is to offer an unqualified and unambiguous apology to the wronged parties (or their successors) without the presumption of forgiveness, mercy, or reconciliation. It is to acknowledge in a public way the moral wrongness of the act, along with its gravity. But it is also to remember the rights violation so as not to repeat

<sup>2</sup>Note the notion of reparations articulated by Bernard Boxill: "... Part of what is involved in rectifying an injustice is an acknowledgement on the part of the transgressor that what he is doing is required of him because of his prior error" (Boxill 1977: 274).

it, as George Santayana might caution. Reparations send a message to all that justice and fairness are top priorities for a reasonably just society or one seeking to become just. The value of reparations in a reasonably just society, then, is to protect and honor the rights of innocents. Insofar as reparations have their expressive functions, they send messages to citizens (and noncitizens alike) which seek to build and strengthen social solidarity toward justice and fairness within a society. In this way, the justification of reparations is forward-looking.

But the protection of rights of innocents implies further and deeper values of reparations. In protecting the rights of innocents, reparations promote self-respect, respect for others, and self-worth. These are features of rights more generally. As a remedial compensatory right, reparations (when respected by a viable legal system) send the message that innocents can depend on certain valid claims or interests withstanding the test of violation, providing a certain level of personal and social security for those in a reasonably just society or one that is attempting to be just.

Various businesses which supported an unjust war owe reparations as they served as contributory causes, insofar as they were responsible agents, to harms of the said war. As such, they should be forced by law to provide compensatory reparations to the victims of their war crimes. In the case of the 2003 military invasion of Iraq by the USA, various businesses, including Z (formerly known as Blackwater USA), owe substantial reparations to the victims of their killings during that ongoing occupation, and criminal charges have already been brought against the company and some of its employees. But numerous other businesses ought to be forced by law to provide their fair (proportionate) share of what is owed to Iraq by such US-based businesses. In so doing, each of the individuals in such businesses who are most responsible for that businesses' involvement in the war crimes in question should be forced by law to pay reparations in proportion to the war crimes she/he has committed before the business itself is forced to do so (Corlett 2014: Chapter 12).

The above considerations are not intended to discount the claim that the US government may

owe reparations to Iraq for its 2003 unjust invasion and occupation of it. Some estimate that up to one million innocent Iraqis have been killed as the result of the invasion and occupation. Iraq's infrastructure and cultural items have in large part been demolished, and the psychic toll on Iraqis today is immense. Approximate calculations must be made in order to determine how much the US government, many US-based businesses, and some of their business leaders owe to Iraq. Unjust wars are war crimes, and those who participate in war crimes as responsible agents must share in the responsibility to rectify their crimes. While each individual or business must be assessed for its own level and degree of culpability for its participation in the war crimes against Iraq from 2003 to present, one must also consider the possibility that there is a collective responsibility<sup>3</sup> for such crimes.

## Conclusion

There are at least two general aspects of the economic and business of war and unjust wars in particular. One pertains to how such wars are supported, that is, which entities/individuals provide resources for the said wars. Another is why some such business individuals and collectives ought to be legally forced to provide reparations to group entities wrongfully (and materially) harmed by unjust wars.

The costs of war are normally calculated in terms of human lives lost, whether civilian or combatant. And normally such mindfulness concerns only those of whom the person is concerned. Rarely do such considerations include the human and nonhuman lives lost on the "enemy" side and what one "side" of the war owes to the other if it started an unjust war. For if such calculations were made on a regular basis and taken seriously, it might alter the mindsets of many who tend to think of war in terms of how it affects them and the ones about whom they care. But that perspective, egoistic as it is, typically assumes the

<sup>3</sup>For a discussion of collective responsibility for reparations, see McGary (1999).

justness of their “side” being in the war to begin with. Yet it is precisely such a perspective which prevents so many from seeing the facts of the particular war in question for what they really are. Consideration of a broad range of factors about the economics and business of wars and unjust wars might possibly broaden our approach to war and how to assess its justifiedness. And perhaps if this is accomplished on a regular basis and with sufficient depth and care, the prospect of the serious implications of compensatory reparations owed for one’s “side” starting an unjust war might cause many more folk to reconsider their support for what they are told is the right thing to do by those having vested interests in going to war on a particular occasion.

## Introduction

Wealth is a buffer to financial, health, and emotional distress and therefore is of importance in creating stable and flourishing economies and societies. Wealth can be used to overcome crises such as unemployment and illness; thus, it differs from income in meaningful ways (Hallsten and Pfeffer 2017). Therefore, it is important to pay attention to how it is dispersed across society. According to UNESCO, global poverty rates have decreased across the globe as a result of economic growth and the creation of wealth (UNESCO 2015). Yet this cheerful story obscures the fact that wealth inequality is growing across the globe. Fortunately, wealth inequality, while a pervasive global problem, has solutions. Since the accumulation of wealth is linked to educational success (Wai and Lincoln 2016), education is key in addressing wealth equity issues.

Personal wealth can be described as a person’s assets minus debts. Therefore, wealth equity can be described as people’s degree of access to the ability to create wealth, that is, whether people have comparable access to the skills, education, and sources of capital required to create wealth. Wealth equity can also be described as people’s *right* to access to those institutions and systems where they can develop the skills, the networks, and financial resources to accumulate wealth. Access to such things is not equitable in most societies.

## Wealth Inequality

Since the 1970s only those households in the top 1% of wealth ownership across the United States have seen their wealth share grow (Fry and Kochhar 2014). This uptick in wealth inequality is linked to income inequality. According to Saez and Zucman (2016), the persistence of high-income jobs strongly influences the concentration of capital and wealth stores. Wealth and income differ in their distribution across an economy; wealth is much more concentrated than income. Moreover, wealth numbers provide more long-term insight into what resources people can access

and accumulate over time and indeed across generations than income rates. Income is subject to temporary shocks such as unemployment, bonuses, and so forth; wealth is more durable though less accessible (Conley 2001).

Americans underestimate the degree of wealth inequality in the United States and vastly underestimate the wealth gap between the rich and the poor. They also vastly overestimate social mobility available to people without wealth. Perhaps because of this, policies that might decrease the gap have little support (Norton and Ariely 2011). This does not bode well for those whose wealth remains constrained. The truth is wealth equity in the United States is on a downward spiral. Zucman (2016) describes wealth inequality in the United States as extreme. By 2012 the top 0.1% of the population held the same percentage of the nation's wealth as during the prior peak of wealth concentration in 1929. Wealth has grown even more quickly for the already wealthy. According to Shorrocks et al. (2016), "no other segments of the wealth pyramid have experienced as great a transformation this century as the millionaire and ultra-high net worth (UHNW) segments. The number of millionaires has increased by 155%, while the number of UHNW individuals has risen by 216%, making them by far the fastest-growing group of wealth-holders."

The wealth of the poor and middle class has eroded (Zucman 2016). The bottom 90% of society held 23% of wealth in 2012, up from 20% in the 1920s but down from a high of 35% in the 1980s (Saez and Zucman 2016). The bottom 90% of the population held a store of wealth equal to the top 0.1% in 2012. Pensions and home ownership drive much of the wealth of the middle class, but as Saez and Zucman point out, the mortgage, consumer, and student debt of the bottom 90% has grown at a faster rate than its wealth. Saez and Zucman (2016) report that wealth inequality within rich families is also increasing – that is, the gaps within the top 10% of society are increasing. Some groups seem to be especially susceptible to wealth fluctuations and inequities. For example, the Great Recession disproportionately hit two groups: adults under 30 (across races and

ethnicities) and African Americans (Zhan et al. 2016; Taylor et al. 2011).

The United States is not alone in experiencing growing wealth inequality. All OECD member countries have shown an inequitable concentration of wealth in the last four decades (Martin and Mira d'Ercole 2015). Like the United States, wealth distribution is also more concentrated than the income distribution in Europe. The top 10% of Europe hold 50% of total wealth, which is ten times more concentrated than income distribution (Martin and Mira d'Ercole 2015).

In 2015, the \$111,270 median family income for families headed by a four-year college graduate was more than twice the median for families headed by a high school graduate. The degree to which people accumulate wealth over the course of their lives correlates strongly with their education level, with people with higher education accumulating more (Mondragón-Vélez 2009). This suggests that increasing access to education will mitigate wealth inequality. But we cannot simply suggest that having an education has a direct positive impact on wealth equity, as there are aspects of the educational system that prevent this. On the one hand education has a positive impact on successful investment decisions and avoiding bankruptcy, loan default, remortgaging, and foreclosure (Cole et al. 2014); on the other hand, student loan debt constrains wealth creation. Education is a complex construct and it would be simplistic to suggest that education alone can eliminate barriers to wealth accumulation. But improving the system itself would greatly increase its power to address wealth equity and narrow the wealth gap.

## Limitations to Contemporary Education

Perhaps one of the more persistent issues with American education is its extremely hierarchical nature. There is the problem of the strata in the American college system. Beyond college and major selection, employability depends on factors that tend to align with class. For example, people with more family money are more likely to have social connections that help them get ahead. They

are also more likely to be able to work as interns for little or no money without starving or exhausting themselves with a second job. These factors compound disadvantage. Constructs like class and power are as important as education itself, especially for those lacking who lack class status and power. Education alone will not solve wealth equity issues because not all educational institutions are equal. The children of the wealthiest dominate the most selective schools. Being born into wealth facilitates the purchasing of education, learning support, and educational success, increasing one's ability to maximize the benefits of an education. It also can translate into a more valuable degree, as schools with higher tuition rates tend to produce higher incomes (Hallsten and Pfeffer 2017).

Even as the cost of college tuition has increased, financial aid to help pay for it has decreased (Cragg and Ghayad 2015; Zhan et al. 2016). This has put post-secondary education out of reach for many, with grave impact on low- to middle-income households (Cragg and Ghayad 2015). For many who do manage to attend college, the increased cost of post-secondary education has also put increased pressure on students to finance their education with debt. Average tuition in 2016 at public 4-year colleges was 3.1 times what it was in 1986. Tuition at private 4-year colleges grew 2.3 times over the same period (College Board 2017). The college board argues that a decrease in funding by the states are a major reason for this increase in price (state funding is cyclical, but indeed the trend is downward). In 2016 funding for eligible full-time equivalent students was 8% lower than in 2006 and 11% lower than 1986 (College Board 2017.)

Student loan debt in the United States quadrupled between 2004 and 2014, from \$260 billion to \$1.1 billion (Yellen 2014). Black students are twice as likely to have student debt as White students (Ratcliffe and McKernan 2013), and the negative impact of student loans on wealth is greater for Black graduates than White ones (Zhan et al. 2016) reflecting the disproportionate poverty of Black families. Across races, net worth is seven times lower for graduates with education-derived debt than for those with no student debt.

While this in part reflects selection effects – people from wealthy families do not take out as many loans, and parents may transfer wealth to young adults – it also means that the same factor that enables the accumulation of wealth incurs a barrier to wealth building. In addition to draining finances, student loans make it difficult for graduates to access credit to purchase assets, which makes it difficult to accumulate assets, such as a home, upon which to base wealth accumulation (Zhan et al. 2016).

Beyond negatively impacting the credit scores of graduates, education-based debt is negatively correlated with initial wage in comparison to similarly educated students, and education loans are negatively related to growth in salaries over a lifetime (Zhan et al. 2016). This suggests that the financial pressure to repay loans leads students to take jobs that they perhaps would be unwilling or less likely to take, were they not under pressure to get to work as quickly as possible. The lower salary level of these jobs suggests they may not require the degree new graduates have just earned, which may suggest they are not good steps in the pathway to stability that a college degree should confer. Furthermore, Zhan et al. (2016) argue that the difficulty of qualifying for a mortgage when one carries high student debt is not the only reason that education-derived debt blocks wealth accumulation. They suggest that people with high student debt have an aversion to taking on new debt for the purchase of assets to build wealth. This psychological barrier is likely further exacerbated by the fact that student loans cannot be discharged in bankruptcy, which makes it particularly risky (Cragg and Ghayad 2015).

The relative value of different majors also reduces the role education can play in improving wealth equity. A nation should value different types of education equally, including different undergraduate majors. The actors and influencers associated with the education system have not upheld this principle. While the people who oversee the education system should be those who are best positioned to take a holistic approach to learning, who prioritize the creation of an educational system as a foundation to build a flourishing society, economy, and political system, including

government actors, this is not the case. Special interest groups like business interests that are not experienced in education have exerted increasing control. Business has become ever more influential in the educational landscape and the strategic and curriculum focus of colleges and business schools in particular. This has driven a focus on work related skill sets, sometimes at the expense of broader skill sets like creative and critical thinking, as well as interest in the common good. This affects wealth equity in a circular way as a lack of students with interest in the common good bodes ill for the future.

For many, education has been reduced to job preparation, leading to a view of higher education as a product in which students and families invest for future employment (Natale and Doran 2012). Because of the financial burden post-secondary education imposes, students and their families often focus on financial return on investment in seeking out degrees. This placement of increased importance on practical oriented education and practical learning outcomes affects students' and student families' perception of what constitutes a worthwhile education. Many place pressure on students to avoid liberal arts degrees and in particular humanities degrees. Liberal arts degrees and perhaps education degrees to a lesser extent are not valued by society to the same extent as business or science degrees. Disparities in earnings, the markets' way of signaling value, between business and liberal arts graduates reflect this. History graduates should be able to look forward to the same financial reward as their business or science school peers after graduation.

Clamoring for an education that imparts skills that promote employability, students' interest in professional education began outstripping interest in liberal arts education in meaningful ways in the 1970s. The growth of majors such as accounting, business administration, and nursing speaks to increasing orientation toward the utility of education across many campuses. From 2000 to 2015, undergraduate enrollment increased by 30%, and for all races and ethnicities, business was the degree pursued most often. Between 2004 and 2015, the number of students graduating from college with a business degree grew from

312,000 to 364,000, while the number of social science or history graduates grew from 157,000 to 167,000 (NCEAS 2017).

Simply put, some majors do not lead to jobs that increase wealth building and misrepresenting them is an error.

The rigid distinction between an education for thinking and caring and an education for doing does not exist. But the myth that one exists encourages students to study fields for which they have no passion. This can lead to a deficiency of needed workers in fields that advance the public interest, such as nonprofit work. It also perpetuates the cycle of wealth inequity. Furthermore, by equating value to earning potential, our culture denigrates necessary fields such as teaching. Not only does this deprive one of the most important fields in the country of highly talented students but it also supports the underpayment of teachers. The supply of teachers is falling as fewer students are choosing this as a career (Allegretto and Mishel 2016), and while the simple supply and demand mechanisms would predict teachers' wages should increase with a contraction of workers, they have not. Public school teachers earned 17.0% less in 2015 than did comparable workers (as opposed to 1.8% less in 1994) (Allegretto and Mishel 2016). More generally, in 2015, the median annual salary of graduates with a bachelor's degree in engineering- or computer science-related degree ranged from \$60k to \$72k, business-related degrees ranged from \$45k to \$58k, and fine arts, education, humanities, or history degrees ranged from \$36k to \$41k (NCEAS 2017).

## Conclusion

Americans are too optimistic about the upward financial/wealth mobility of disadvantaged Americans (Norton and Ariely 2011). The same optimism could lead to excessive optimism about the role of education in fixing issues of wealth equity. This overly optimistic perspective on the efficacy of contemporary education could block needed reform. There are other issues at play, and education, while important, could do much more to fix

the wealth equity issue were the issues outlined here addressed. Some students are constrained in their wealth building capacity by where they study, others are constrained by what they study, and others are constrained by how they pay for their studies. None of this should continue. College for all would be a great step, but it will not close the wealth gap without reform.

## Educational Ethics

## Introduction

Educational ethics, understood both as an area of scholarly inquiry and a subject taught in university- and college-based teacher training, has a history that is very distinct from the way ethics emerged as a concern in recent decades in classical professions like medicine and law. According to the standard narrative, starting in the 1960s, a decline in public trust towards traditional authorities fueled a demand for greater accountability among the professions. Confronted with a new situation in which public trust could no longer be taken for granted, the professions responded by introducing more stringent and transparent mechanisms to regulate professional conduct. These mechanisms included enhanced ethical codes, formal disciplinary committees, and mandatory training in ethics. In teaching, by contrast, it has long been recognized that ethical concerns permeate and guide every aspect of educational practice. Like other professionals, teachers are expected to adhere to standards of ethical conduct themselves. But they are also called upon to impose ethical standards on students by enforcing school rules, participate in the promotion of collective values through instruction and the curriculum, and act as a positive influence on students by modeling ethical conduct, both on and off duty. How to best prepare educators to assume the multifaceted role morality of the teaching profession is a perennial concern among educationalists as well as a source of contention. Inspired by discourse on professional ethics emanating from the classical professions, some emphasize that teachers are subject to a set of common norms of professional conduct that exist primarily to ensure that teachers provide the highest quality of public service and exercise the authority granted to them by society in a responsible way. This perspective on educational ethics, however, is but one among at least three conceptions that vie for dominance in educational scholarship, practice, and preparation. There is also the moral education perspective, which centers on preparing teachers to foster positive ethical traits and dispositions among young people, and the social justice agenda, which centers on raising

teachers' consciousness about the fact that schools can be a motor of both exclusion and social justice, and preparing educators to act as agents of civic equality. To understand these unique contours of educational ethics, one needs to understand how teachers' role morality differs from that of a classic profession and how teachers' role morality as it is currently conceived contains layers that reflect the historical development of teaching as an occupation.

## Role Morality in Teaching

As soon as teaching began to emerge as a livelihood – historians of Western education typically trace this moment back to ancient Athens – the teacher's main task was to shape their students by instilling in them certain desirable ethical and social qualities. Although the exact combination of traits teachers were expected to foster has shifted over time and in relation to their students' place in the social order, the basic purpose of teaching has overwhelmingly been to facilitate the acquisition of socially desirable traits among students. This moral orientation of teaching influences not only the curriculum, or the subjects and skills in which teachers are asked to provide instruction, but also the standards of conduct they are held to in their interactions with students and their families as well as in their private lives. Today, the teacher's role is centered on providing instruction in taught subjects as a way to prepare students to enter a competitive job market and meet the needs of a rapidly changing society. From the vantage point of the present, it is easy to forget that this is a rather new conception of teaching. Until very recently in historical terms, instruction was a means to another, ethical end of the holistic forming of persons. In this context, the primary responsibility of teachers was to incarnate and model the kinds of personal characteristics the education system was designed to foster and promote.

As any historian of teacher education can readily confirm, preparing future teachers to assume the role of moral models for their students was a primary concern of teacher education in Europe,

North America, and Australia from the beginning of formalized teacher education. Traditionally, teacher educators were very much preoccupied with impressing on prospective teachers the need to adhere to strict moral standards of personal conduct as much in their private lives as in their work with children and young people in schools. Over roughly the first half of the twentieth century, as teacher training was handed from religious groups to normal schools and then finally to universities and colleges, its focus gradually moved from ensuring that candidates possessed the ethical qualities associated with morally upright people to helping them develop the skills they would need to provide effective instruction (Labaree 2008).

Despite this radical reorientation of teacher preparation, contemporary analyses of teachers' role morality continue to regard standards of conduct that set ethical limits on the exercise of professional skills as merely one facet of the role morality of the teaching profession. Ethical concerns surface in teachers' work in four additional ways that make the professional relationship between teachers and the public they serve fundamentally different from the standard professional-client relationship (Forster and Maxwell 2022). First, teachers are expected not only to adhere to standards of ethical practice themselves but they must also, through setting and enforcing school and classroom rules and regulations, impose ethical standards on the primary recipients of their services: students. Second, what teachers teach, the act of including and excluding classroom material via the curriculum, sends implicit but powerful messages about which knowledge and perspectives are valued and which are not. Third, how teachers teach, the manner in which teachers carry themselves in the classroom in terms of their attitudes towards content, students, and student behavior sets a standard for students of intellectual integrity and interpersonal conduct. Finally, because teachers are in such close social proximity with students – as it is often observed, many primary school students spend more time with their teachers than they do with their own parents – society demands that teachers model social values and good personal conduct, an obligation that

extends to their private lives. Teachers are held to higher ethical standards off-duty than other professionals. The way teachers behave in their private lives can, it is claimed, influence young people and parents need to know that teachers are the kinds of people to whom they can entrust their children. Because of these multiple ways in which ethical concerns interpenetrate teaching practice, it is still very difficult to wholly separate being an ethical teacher from being an ethical person, as much for the public as it is for teachers themselves.

## Professionalization of Teaching

The emergence of the professionalization of teaching movement in the 1980s added an additional layer of nuance to the already complex issue of teachers' role morality. Mirroring the professionalization process of other semi-professions like nursing and social work, teaching's struggle for recognition as a profession pursued two main strategies. One strategy focused on modifying the institutional framework of teaching and teacher education so that it came to mirror those of a typical profession. An example of this strategy is the massive and successful drive to bring teacher education into universities and colleges. The other more radical approach involved trying to modify the very nature of teachers' work so that it became more analogous to the kind of "knowledge work" that defines the classical professions. The exponential growth of educational research, ostensibly aimed at providing the requisite evidence base for effective instruction, exemplifies this strategy. In this context, two discourses in teacher education appeared to converge, making it clear to many that a renewed prioritization of the ethical dimensions of teaching in teacher education was an urgent, if not a forgone conclusion.

The first discourse, widely associated with Tom's (1984) celebrated book *Teaching as a Moral Craft*, centered on the idea that "the act of teaching is moral" in the sense that education inevitably involves attempting to transform people in ways that are considered to be good or worthwhile. What incited Tom and other scholars

of this period to embark on a renewed exploration of this ancient idea was a concern about the future of teacher education when it is increasingly focused on evidence-based instruction. In a critique that still seems fresh today, Tom argued that the newly dominant “applied-science metaphor” of teaching highlighted the technical aspects of teaching while rendering obscure to those involved in teacher education that teaching is necessarily as much about transmitting values and social ideals as it is about transmitting knowledge and skills.

The second discourse, which emanated from the reform movement in teacher education launched by the landmark 1983 report on the state of public education, *A Nation at Risk*, was concerned about aligning teacher education with broader trends in ethics education in the professions. In the immediate wake of *A Nation at Risk*, two major commissions on teacher education were struck: the Holmes Group initiative and the Carnegie Task Force. Both groups’ analyses of teacher education in the United States, as well as their recommendations about how to improve teacher education, took as a touchstone the model of professional education that had emerged in medicine over the course of the twentieth century. The reports of both groups, for instance, advocated for the abolition of undergraduate degrees in education to be replaced by “clinical schools” under the auspices of local school districts, and both reports urged trustee institutions responsible for overseeing teacher education to work towards a field-wide consensus on the “knowledge base of teacher professionalism.” In the short term, the impact of these reports was to lend a great deal of credence to the idea that teacher education in the future would look more and more like medical education and hence include training in professional ethics.

In the teacher education literature, then, a new idea began to be taken very seriously by a number of high-profile educationalists. This idea was that the basic conception of professional ethics education that had emerged with the modernization of medical education – focusing on familiarizing students with codes of ethics, the ethical concepts embedded in practice, the inherent ethical

complexity of professionals’ work (and the attendant ethical dilemmas), and so on – now had a place in teacher education. Following the introduction of the National Education Association’s code of ethics in 1975, and against the background of the drive to professionalize teaching mentioned above, there was a period of confidence that before long educational ethics would have a central place in teacher education programs, either in the form of a dedicated course or as integrated curriculum (Goodlad 1990). During this period, a literature on the ethical and moral dimensions of teaching began to appear and efforts got underway to align how ethics education content was handled in teacher education with broader trends in professional education (Warnick and Silverman 2011).

## Educational Ethics and Teacher Training

By the 1990s, however, teacher educators had already begun to raise doubts about the progress made in this direction and attempts were underway to account for why teacher education, as Glanzer and Ream (2007) put it, had “missed the ethics boom.” To gain an empirical perspective on mostly anecdotal claims that teacher education has resisted the ethics movement in higher education, and following the lead of similar work aimed at tracking the progress of ethics education implementation in other professions, survey work was undertaken to take stock of the state of ethics education in teacher education (i.e., Maxwell et al. 2016).

In terms of the question of how common it is for future teachers to receive dedicated training in the ethical dimensions of the profession, the main finding of this research was that 24%, or 97 of the 401 teacher education programs surveyed across five OECD countries, included at least one mandatory course dealing with educational ethics. When compared with the cross-disciplinary data on the frequency of an ethics requirement in professional formation in fields including medicine, business, dentistry, engineering, this finding suggests that initial teacher education is in no way exceptional. Teacher education may be far from

the top of the league tables with regard to the structured teaching and learning of ethics in the form of a dedicated course. However, the finding that roughly a quarter of the programs leading to teaching certification surveyed contained a mandatory ethics-related course places teacher education above engineering but still well below the 50% frequency figure found in medicine, the field often considered as being at the vanguard of the ethics education movement in higher education.

Another significant feature of ethics education for preservice teachers revealed by the survey was just how many different forms ethics courses on educational ethics take. On one hand, there seems to be broad agreement among teacher educators the educational objectives of ethics training for teachers. Over 90% of respondents affirmed that developing teachers' ethical sensitivity, raising their awareness about professionalism, promoting professional values, developing professional qualities like honesty, fairness, and empathy, and practicing reasoning skills are important teaching and learning objectives of a course on educational ethics. On the other hand, the educational strategies put in place by particular academic units to pursue these goals vary considerably.

Ethics courses for future teachers tend to adopt one of three approaches that allign roughly with the three aspects of teachers' professional role morality, presented above: the social justice approach, the moral work of teaching approach, and the professional ethics approach. The social justice approach prioritizes raising teachers' awareness about and how teachers and schools can contribute to social exclusion and what they can do to change that (see Clausen and Logan 2020). The moral work of teaching approach prioritizes preparing teachers to help foster character, virtues, or values in young people, often through promoting virtues, values, and professional ideals among future teachers themselves (see Sanger and Osguthorpe 2015). Finally, the professional ethics approach prioritizes initiating future professionals into a community of practice defined by a shared conception of what it means to act ethically and responsibly in the provision of educational services (see Campbell 2008).

In the abstract, the way these approaches to educational ethics articulate with one another is bound to generate normative friction. In practice, however, they are complementary. The professionalism agenda in ethics education, for instance, is routinely critiqued by proponents of the social justice agenda. By focusing narrowly on teachers as individual actors responsible for their own conduct and the immediate well-being of their clients, critics argue, the professionalism approach risks obscuring crucial macroethical issues in professional practice. From a practice perspective, however, establishing a rigid hierarchical ordering of these agendas in teacher education seems artificial and counterproductive. To illustrate with a simple example, when teachers treat their pupils fairly, they are respecting norms of ethical professionalism *and* promoting equality as a moral and social value through modeling *and* acting to minimize discrimination in the school. Preparing ethically accountable practitioners versed in the collective standards of teacher professionalism, supporting new teachers' capacity to act effectively as moral educators and models of good citizenship, and raising teachers' awareness about how the school systems can reinforce deep seeded social injustices may be distinct objectives of teacher development, but they are all important.

## Conclusion

Teachers' role morality is multifaceted and comprised of historically layered ethical expectations that society and the teaching profession impose on teachers. In light of this reality, it should come as no surprise that the problem of the professional socialization of teachers into the collective ethical norms of the profession is contested terrain. The rich variety of approaches to dealing with ethics, values, and morality found in teacher education – and the heated debates among teachers themselves about which approach serves students, society, and teachers best – is not just an attempt to “catch up” with trends in higher education or “normalize” teacher education by making it resemble more closely that of the classic professionals. Instead, it is the reflection of continuing

efforts among teacher educators and the teaching profession to find an appropriate educational response to the unique ethical contours of teachers' work.

## Ego Depletion: Overview and Implications for Ethical Choices

## Introduction

This entry provides an overview of ego (“regulatory”) depletion (or, simply, “depletion”), including potential triggers and implications. Then it explores implications of ego depletion in ethical settings. Finally, the entry concludes with suggestions on how to mitigate the potential depletion effects.

## Overview

Consider walking into the grocery store after a long day. You have made many decisions throughout the day and have just challenged your self-control by bypassing the ice cream aisle. You are now facing a wall of cereal boxes and your favorite brand is sold out. . . what do you do? Do you leave? Do you pick the closest one? Do you take the time to review the boxes to find a healthy alternative? Research suggests that when your regulatory resources are depleted, you will become a “cognitive miser” and focus on whatever dimension of the current choice demands the least amount of your regulatory energy. For some people that choice becomes focused on price; for other people it might be taste – in fact, research finds that many depleted people will simply stop

buying when there are too many options (Baumeister and Tierney 2011).<sup>1</sup>

Whether called ego depletion (Baumeister et al. 1998), self-control depletion (Muraven and Baumeister 2000), self-regulation depletion (Muraven et al. 1998), or some other form of regulatory depletion terminology, the concept focuses on one's ability to self-regulate (regulation). Regulation is the activity whereby individuals "seek to exert control over their thoughts, their feeling, their impulses and appetites, and their task performances" (Baumeister et al. 2006, p. 1773). It is the regulation of self-control that provides the resources necessary to get up in the morning instead of hitting snooze one more time, restrain from eating the last bite of dessert, work when it is a beautiful day, and so on. According to Baumeister et al. (2007), "self-control refers to the capacity for altering one's own responses, especially to bring them into line with standards such as ideals, values, and social expectations, and to support the pursuit of long term goals" (p. 351). However, research finds that the ability to regulate one's self-control is finite – the act of utilizing self-control depletes this limited supply of regulatory resources, which then leads to conservation of the remaining regulatory resources – which then impacts performance in any task requiring further regulation (Baumeister et al. 1998, 2000, 2007; Baumeister and Vohs 2007). From an ethical perspective, depleted individuals have reduced resources available to manage their ethical decisions.

## Regulatory Resources

Imagine you are about to face a parole board; would you want this to occur before or after

lunch? The board's decision should be based solely on laws and facts made in a "rational, mechanical, and deliberative manner" (Danziger et al. 2011, p. 6889). In theory, the time of day shouldn't matter. However, research by Danziger et al. (2011) suggests that it might. Their study finds that parole board members default to the more passive decision of denying parole before lunch or at the end of the day, as opposed to granting prisoners with similar profiles parole more frequently at the beginning of the day or after lunch. They attribute these differing decisions to regulatory depletion. In essence, they find that taking breaks replenishes the judges' regulatory resources and influences their decision patterns.

## Why Do People Become Depleted?

Research suggests that self-regulation operates similar to a muscle. That is, once the "muscle" is fatigued from exertion, it must be given time to replenish (Baumeister et al. 2007). Similarly, the act of utilizing regulatory resources leads to "an effort to conserve remaining resources" (Baumeister et al. 2000, p. 130). Thus, when depleted, individuals are limited in their ability to engage in tasks requiring self-regulation until these resources are replenished (Muraven and Baumeister 2000). Baumeister et al. (2006) outline the distinctions between the impacts of regulatory depletion versus mental fatigue and conclude that depletion impacts a higher level of cognitive ability requiring regulatory resources in a way that is distinct from mental fatigue.<sup>2</sup> In fact, they note that when an individual is fatigued, stimulation tends to increase performance on a related task, whereas when individuals are depleted, their performance on a second task requiring depletion (regardless of domain) is negatively impacted.

While the impact of regulatory depletion is likely not attributable to mental fatigue, there is likely some physiological impact related to the

processing of glucose. This phenomenon isn't completely understood, but Baumeister (2018) suggests that glucose is depleted as one utilizes self-control, leading to self-regulatory depletion. This raises the question: can the human body really run out of glucose? Baumeister cites work by Beedie and Lane (2012) who suggest that while the body may still have adequate resources, it will rely on a resource-allocation model for self-control. In essence, the body estimates the current resource demands and decides whether the given (and future) task is worth investing in. This leads to a situation where the current expending of regulatory resources (glucose) leads to the conservation of future resources until such time that the resources are fully replenished.<sup>3</sup> Thus, "restoring glucose to higher and optimal levels should replenish the ability to exert self-control" (Gailliot et al. 2007, p. 326). In essence, this means that one should maintain a healthy caloric consumption during tasks that require self-control. Since individuals do not typically eat continually, nor do they always know when they are depleted (Baumeister et al. 1998; Muraven et al. 1998), they succumb to the effects of depletion.

## Potential Triggers

Early regulatory depletion studies find that resisting temptation leads to a decrease in self-control resources. For example, Baumeister et al. (1998) find that individuals are depleted when they are instructed to eat radishes while fresh cookies are available but they are not allowed to eat them. In addition, Baumeister et al. (1998) find individuals become depleted when they are forced to present counter-attitudinal speech on a disagreeable topic or where individuals are asked to cross off all "e"s in a passage of meaningless text. Further, Muraven et al. (1998) find that restricting participants' emotions during a sad movie, instructing participants' to not think

about a white bear during a writing assignment, and completing hard math problems all lead to depletion. Beyond resisting temptation, research finds that activities such as making active choices (Vohs et al. 2008), switching mindsets (e.g., "how" versus "why") (Hamilton et al. 2011), and delaying gratification (Buccioli et al. 2013) all also cause ego depletion.<sup>4</sup> In essence, research finds that any activities requiring active regulatory resources lead to a depleted regulatory state.

## General Impact

Research has found that the depletion impacts a wide spectrum of activities – from not being able to withstand physical efforts (holding a hand in cold water, drinking sour liquids, enduring physical stamina tasks, etc.) to cognitive tests (completing puzzles, completing problem-solving tasks, duration of watching boring movies, etc.) (Muraven et al. 1998; Baumeister et al. 1998).

One unifying theme related to the impact of depletion is that, as depleted individuals attempt to conserve their remaining self-control resources, they default to the decisions that are the least impactful on remaining self-control resources (Baumeister et al. 2000; Pocheptsova et al. 2009; Evans et al. 2011) or to situational cues (Banker et al. 2017). For example, if someone is naturally risk-averse, they might default to choices consistent with less risk (as exemplified in the earlier parole scenario). However, if someone is more risk-seeking, they may engage in riskier behaviors. Interestingly, this can be situation specific. Thus, building on the earlier parole board scenario, one parole board member could default to not providing parole before lunch but might then drive in a risky manner on his/her way to dinner. In both settings, the parole board member is depleted. However, the individual follows a conservation strategy that leads to seemingly opposite outcomes where the parole board

member is acting in a risk-averse manner when judging a parolee but in a risk-seeking manner when driving (s.f.e. Unger and Stahlberg 2011; Freeman and Muraven 2010).

Schmeichel et al. (2003) find that outcomes are conditioned on the nature of the decision process. They find that depletion only affects complex thinking (e.g., logic and reasoning tasks), as opposed to simpler, route-type thought processes (e.g., general knowledge questions). They find this effect is caused by the need for active processing when engaged in complex thinking, which utilizes the limited pool of regulatory resources. Further, Hurley (2017) finds that the impact of depletion can accumulate over time and lead to an exacerbating effect on the within-day depletion effects.

### Impact on Ethical Decision-Making

As a thought exercise, consider the following: if we accept the precept that depleted individuals make decisions to conserve their regulatory resources, what is the default decision when someone faces an ethical decision? Mead et al. (2009) observe that there is “motivational conflict” between the short-term gains earned through a dishonest act and the long-term rewards earned through social acceptance. Their research reconciles this conflict by testing and finding that depleted individuals have less resources available to dedicate the self-control necessary to act honestly. Thus, they find that not only does dishonesty increase with higher depletion, but also individuals will be more likely to expose themselves to situations with temptations to cheat – thus, exacerbating the situation.

In addition, Reinhard et al. (2013) find that depleted individuals are less accurate at detecting deceptive messages than those who are non-depleted. Possibly more disturbing, but maybe not surprising, is that depleted individuals are also found to feel less guilty than non-depleted individuals (Xu et al. 2012). Thus, not only does research suggest that individuals will act less honestly and more easily find themselves in morally complex situations but that they will feel less guilty when they do make an unethical decision.

However, if we return to the precept that individuals act to conserve regulatory resources, then these findings raise the question of how depletion will impact someone who is naturally inclined toward honesty. Gino et al. (2011) explore this question. They find that individuals measuring high in moral identity are less dishonest when depleted than individuals who are lower in moral identity.<sup>5</sup> They conclude that those who are naturally more honest do not need to expend the same level of regulatory resources in making an honest decision, which moderates the impact of depletion.

Finally, Yam et al. (2014) explore when depletion can lead to *decreased* unethical decisions instead of *increased* unethical decisions. In their setting, they focus on whether the unethical behavior has high or low social consensus. They argue that because high social consensus unethical behavior is generally agreed to be unethical, it requires a significant amount of initiative to act on the unethical decision, which requires the engagement of self-regulation resources, thus leading to a decrease in unethical behavior. Conversely, low social consensus unethical behavior is more ambiguous as to the moral impact. Thus, a depleted individual lacks the regulatory resources to overcome the moral conflict making short-term rewards seem more beneficial than long-term gains of following their moral principles and leading to an increase in unethical behavior.

In summary, when the choice requires regulatory resources to actively decide to follow an unethical path, depleted individuals will default to an ethical decision. However, when the choice is ambiguous and choosing the ethical decision requires regulatory resources, then a depleted individual will default to an unethical choice, contingent on their level of moral identification. Thus, when considering the impact of depletion in an ethical setting, it is important to consider what the least effortful choice (in a regulatory sense) will be as that will likely guide an individual's

<sup>5</sup>Gino et al. (2011) observe that, “Individuals high in moral identity have strongly internalized moral standards and thus do not need to expend cognitive resources when thinking through the decision of how to resolve ethical dilemmas.”

decision – whether they realize it or not. In the next section, we explore some tools for mitigating the effects of depletion.

## Mitigating Regulatory (Ego) Depletion

Think about the last time you worked out. If you are like me, your muscles wore out quickly and needed time to recover. As discussed earlier, depletion research often uses the analogy of a self-control muscle: performance declines over time and needs time to recover (Muraven and Baumeister 2000). However, with frequent exercise of self-control, individuals can train themselves to better resist the effects of depletion (Muraven and Baumeister 2000). In fact, research finds that self-control can be improved even with regular exercise. Research supports the idea that the self-control necessary to engage in exercise on a consistent basis also builds a greater reserve of this regulatory “muscle,” which then translates into other, unrelated, tasks requiring similar regulatory resources (Baumeister 2018).

In addition, as mentioned earlier, individuals likely do not know when they are depleted. Thus, another line of literature explores ways to address depletion through various strategies to enhance an individual’s ability to self-regulate their behavior. For example, Webb and Sheeran (2003) find that forming implementation intentions prior to the depleting task helps minimize the impact. Implementation intentions take the form of specifying when, where, and how to act. In this way, they circumvent the need for cognitive control by creating specific behavioral cues *prior* to the need for self-control. Thus, if one knows that they are going to be tempted with unethical decisions, she/he could create personal decision cues that would automate their decision process. Consider someone who is about to take a test in a crowded setting. She/he could decide ahead of time that anytime they needed to look away from their test, they would only look up. That way, they would not have the temptation to look at a neighbor’s exam.<sup>6</sup>

It should be noted, however, that setting a personal implementation intention is distinct from expectation of a future depleting task. Muraven et al. (2006) find that someone who is currently depleted, and expects that they will be required to perform in a future depleting task, will perform worse on a current task than someone not knowingly facing a future depleting task. Thus, the act of attempting to conserve resources actually *decreases* performance in the current task. Muraven et al. (2006) observe that “self-control performance is related to how much self-control participants exerted previously and the amount of self-control they expect to exert in the near future” (p. 536). While warning someone about a future depleting task may be counterproductive to the current task, Janssen et al. (2010) find that by forewarning someone about an impending situation where they are likely to be influenced, they conserve resources such that they can more effectively avoid complying with the persuasive request. And Martijn et al. (2007) find that providing a positive exemplar (“a person or thing to be copied”; Savur 2017, 22) seems to increase performance in depleted individuals. In their setting, they provide a vignette about a famous ice skater who didn’t give up or quit. They suggest that this simple motivational example provided an adequate prod for participants to expend additional self-control resources.

Taken together, these results suggest that individuals can decrease the potential for making unethical decisions when depleted. For example, helping individuals identify specific situations where they may be tempted to engage in unethical situations and then helping them role play decision cues that can short-cut their need for self-control in those settings are likely to increase adherence to positive ethical decisions. Further, providing examples of others who have successfully navigated these settings likely would help as well. In general, research suggests that for someone facing an unethical setting, it is important not to simply focus on the challenge generally but

<sup>6</sup>This is consistent with Mary Gentile’s “Giving Voice to Values” (Gentile 2019). Future research could explore

whether this (or similar practical) system for ethical integration provides an adequate foundation that would lead individuals’ ethical choices to be less impacted by depletion.

rather focus on the impact of situations on self-control resources – preferably *prior* to the individual becoming depleted.

## Egoism and Libertarian Ethics

Eric Pezet

University of Paris Nanterre, Paris, France

### Synonyms

Laissez-faire; Libertarianism; Self-interest; Selfishness

### Introduction

Although not a concept contemplated in ethical terms by either Murray Rothbard or Ludwig von Mises, egoism is strongly present in libertarian philosophy through the work of Ayn Rand: “The Objectivist ethics holds that the actor must always be the beneficiary of his action and that man must act for his own *rational* self-interest” (Rand 1964:

8). Rand also developed this idea in her fiction, which is chronologically anterior to her philosophy. Her literary work gives context to her philosophy and makes it possible to associate psychology with normative objectivism.

Historically, Rand’s thought was significantly influenced by the political context of the Cold War, which explains both its development and its popularity, in particular in the USA. Against the backdrop of a philosophy of the state rendered as important as the philosophy of the individual, egoism appears as the salutary asceticism needed to resist the state.

### Egoism in Libertarian Doctrine

Rand’s philosophy and fiction are so closely intertwined that, in her essay entitled *The Virtue of Selfishness: A New Concept of Egoism* (1964), she introduces her approach to values by quoting her literary characters:

I quote from Galt’s speech: ‘Man has been called a rational being, but rationality is a matter of choice and the alternative his nature offers him is: rational being or suicidal animal. Man has to be man by choice; he has to hold his life as a value – by choice; he has to learn to sustain it by choice; he has to discover the values it requires and practice his virtues by choice. A code of values accepted by choice is a code of morality’ (Rand 1964: 19).

Although individualistic, egoism is not asocial. It does not separate the individual from others: “There is a fundamental moral difference between a man who sees his self-interest in production and a man who sees it in robbery” (Rand 1964: 7). Furthermore, freedom is collectively exercised through communities where people share norms of living. Friendship and love are important aspects of social life. Friendship is a way to relate to others – but, in Rand’s view, it is evaluated by reference to emotional cost. This cost is unavoidable because it is the uncontrolled price paid for the support of others; it has to be evaluated because “man must live for his own sake, neither sacrificing himself to others nor sacrificing others to himself. To live for his own sake means that *the achievement of his own happiness is man’s highest moral purpose*” (Rand 1964: 23).

Nozick (1971) questions whether Rand has succeeded in demonstrating that life is a value. To illustrate the fragility of Rand's argumentation, he examines the behavior of John Galt in *Atlas Shrugged* and points out that Galt is prepared to sacrifice his own life if his beloved Dagny Taggart is threatened with torture. There are internal conflicts here which run counter to rational behavior as defined in Rand's own philosophy. According to the latter, emotions are not denied, and they are also closely related to values: "Emotions are estimates of that which furthers man's values or threatens them, that which is *for* him or *against* him – lightning calculators giving him the sum of his profit or loss" (Rand 1964: 23). Measuring effective involvement, which is a characteristic of friendship and similar relations in Randian philosophy (Saint-Andre 2007), is an aspect of libertarian egoism. There is a constant concern for measurement here, while there is also an acceptance that human rationality is fallible. The impact of emotions on value is measured in order to control and adapt one's behavior and thus exact more personal profit. This permanent control and adjustment of one's behavior is a property of asceticism, which reflects "voluntary, personal practices intended to cause a transformation of the self" (Hadot 2002: 276).

Selfishness is emotional, and emotions are seen as a signal of the existence of values. Although emotions are not regarded as directly productive of personal benefit, as indicators for ascetic practices they are nevertheless indirectly productive, in that they relate the individual to society. In sum, Nozick highlights the contradictory effects of emotion in Rand's novel: instead of acting as a signal guiding toward rationality, as suggested in Rand's own philosophy, emotions overwhelm Galt and lead him to act irrationally. Thus, the ideal of free society that Rand presents as "only rational, productive, independent" (Rand 1964: 102) appears difficult to reach.

## Business Ethics and Egoism

Rand's difficulty in arguing and demonstrating her own theory of value might be due, according

to Nozick (1971), to the incompleteness of her philosophy. In addition, her philosophy is first and foremost a philosophy of the individual against the state – a feature that allows it to articulate so well with libertarianism. Any individual should be able to live according to the basic value of self-accomplishment; and the government should grant all individuals the freedom to act in alignment with this value. Government and private individuals are symmetrically positioned on either side of social norms: "A private individual may do anything except that which is legally *forbidden*; a government official may do nothing except that which is legally *permitted*" (Rand 1964: 104).

Objectivist philosophy is attractive to business ethics because it deals with self-confidence in a context where institutions and competitors can be a threat to the individual business decision maker. In the libertarian view, institutions constitute threats by definition, while other individuals may be, depending on circumstances, either threats or sources of support. Under the assumption that industry is production and government is force (Rand 1964: 107), government is regarded as having a tendency to jeopardize individual freedom – through various means such as discourse, propaganda, and direct action on people. Consequently, communities have to protect themselves from the dominant agency of the state.

From a libertarian point of view, utilitarianism is not acceptable because it assumes a renouncement of the self for the common benefit: "The philosophers who attempted to devise an allegedly rational code of ethics gave mankind nothing but a choice of whims: the 'selfish' pursuit of one's own whims (such as the ethics of Nietzsche) – or 'selfless' service to the whims of others (such as the ethics of Bentham, Mill, Comte and of all social hedonists, whether they allowed man to include his own whims among the millions of others or advised him to turn himself into a totally selfless 'shmoo' that seeks to be eaten by others)" (Rand 1964: 26).

Egoism is, therefore, the most effective shield that the individual can hold against the state, an instrument of self-defense against the aggression of the state. Hence, as resistance to the pressure

of society, selfishness is at the center of entrepreneurial ethics. Business does not wait for any entrepreneur, and self-confidence is the first asset an entrepreneur should possess. While in Mandeville (*The Fable of the Bees*, 1724), egoism is regarded as a psychological trait, Rand's interest in egoism is associated with the influence of emotion on human behavior. Rand's appeal to egoism provides capitalism with an ethical context. Her chronic aversion against the state draws her to libertarianism, and she complements the latter by proposing an asceticism of self-confidence. The State may weaken the citizens and make them lose self-confidence in order to better control them. To hold one's life as a value, as Rand recommends, presupposes strengthening one's self-confidence.

The entrepreneurial ethics inspired by Rand's ideas is distinctive in that it insists on this strengthening of self-confidence. As Wilson (1993: 784) mentions, the manager has to find internal fortitude to resist changes in the context of their managerial projects and decisions. However, business ethics cannot be reduced to the colloquium of one single author with their fictional characters. Organizations are complex phenomena that profoundly influence business behavior, in many ways. In this context, it can be said that the ethics of egoism is not about the defense of universal moral principles but about the vital preservation and nurturing of one's life, when one's life is understood as the central value of that life. Egoism, therefore, cannot be limited to resistance. It is, inevitably, a driving force for self-development.

## Introduction

### What Is in a Name?

In the USA and the UK, the term “socially responsible investment” (hereafter SRI) dates back to the 1970s and was primarily associated with selecting a portfolio of equities that screen out companies that on some basis violated the beliefs of the portfolio creators. So-called negative screening might omit,

for example, firms involved in nuclear power, weapon manufacturers, or major polluters. Also called “ethical investment,” negatively screened portfolios could and did vary in the actual content of what one considered ethical based on the creators’ political, moral, or religious belief systems. By the late 1990s (again in the UK and somewhat later in the USA), such negative screening did not disappear but was supplemented and overtaken in assets under management by additional (and sometimes exclusive) systems of portfolio creation. Thus, for example, rather than necessary excluding a major polluting firm, shareowners (as well as nonowning stakeholders) might engage with the management and directors of the firm to attempt to mitigate the offending conditions.

Such engagement (also known as corporate governance activism) sought less to ensure a given portfolio was ethically “pure” but rather focused within some set of limits on changing corporate behavior. The earlier forms of SRI became known as the ethical case, while the later became known as the business case, which additionally argued that firms that do “good” also do “well.” (However, it should be noted that many “ethical” SRI portfolio managers also engaged with corporate leadership.) Over time, the “business case” SRI came to distinguish itself from the “ethical” SRI as new terms and categories were developed, in part to developing a “mainstream” business case SRI. The most important among these terms is the acronym ESG, which stands for environmental, social and governance investment factors.

As of this writing, so many terms and categories have been developed with multiple meanings and usages that it is often difficult to know what the user means if one does not query for his or her specific understanding. Thus, for example, even the abbreviation “SRI” can have its original meaning (socially responsible investment) or a newer meaning, and even more recently “sustainable responsible impact” investing, which often tilts toward the “business case.” Similarly, “SRI” can also mean “responsible investing,” “sustainable investing,” or including in investment decision-making environmental, social and (corporate) governance (ESG) factors. This entry uses SRI and ESG to

encompass all these terms with multitudes of various meanings.

## Emerging Trends in SRI

As of this writing, the growth of SRI is exemplified by, for example, the London-based Principles for Responsible Investment (PRI) that is composed of about 1,600 global signatories with approximately \$60 trillion in assets under management. ESG has become the new normal as an investment factor integrated increasingly into benchmarks against which to measure a portfolio’s performance. It increasingly encompasses non-equity asset classes, e.g., bonds, private equity, real estate, infrastructure, and commodities, as well. In addition to the focus on ESG factors, there is an emphasis on long-term investment ownership horizons, in contrast to a shorter-term trading. The former is increasing also characterized by an explicit investor stewardship concern, which is seen as implicit in the categories of social and environmental foci. Some large investors (e.g., CalPERS, the largest US public pension fund) have begun to formulate investment principles or philosophies emphasizing, for example, three forms of capital: financial, physical/environmental, and human/social, the latter two corresponding to E and S.

While there are numerous foci in the E and S and G categories, the following indicate some typical specific examples:

- E:** carbon emissions, energy efficiency, waste management, clean technology
- S:** labor management, human rights, employee safety and working conditions, product safety
- G:** corporate board structure and practices, compensation disclosure and structure, board diversity, ownership engagement

As ESG has become the new and increasingly global normal as a core investment factor, one major challenge is the interrelated problem of how firms disclose their ESG factors and how those factors should be defined and by whom. In short, what is the firm-specific composition of

SRI? Thus, disclosure, standardization, and third-party authentication (auditing) have emerged as key issues. The global current state of affairs lack agreement on factor definition, disclosure standards, and/or metrics and third-party auditing.

There are a number of systems in use or proposed for disclosure, such as the Global Reporting Initiative (GRI) and the US-based Sustainability Accounting Standards Board (SASB); the former aimed at both investors and stakeholders, while the latter is focused only on investors. SASB models itself on the US Financial Accounting Standards Board, and its proposed disclosures are based on governmental reporting requirement for publicly listed firms. A major challenge for both the GRI and SASB is that disclosure by firms is entirely voluntary and far too often highly selective, rather than comprehensive. Indeed, many large corporations receive more than 500 requests for disclosure on a myriad of topics per year. Questionnaire fatigue has become widespread. What constitutes completeness is not yet determined. From an investor point of view, for example, SASB focuses its disclosure standards using its materiality yardstick, basing its analysis on US Accounting and Disclosure Standards. Other stakeholders (e.g., animal rights or environmental activists) may have other standards, but the one that is emerging from increasingly large number of investors and among corporates themselves is some version that uses a materiality standard for disclosure.

### **Materiality**

Materiality from an accounting and legal point of view is usually closely related to regulatory regimes, which can vary among jurisdictions. But in regards to ESG and SRI, various regimes have much in common. The US SASB's materiality standard is defined based on the Supreme Court decision which held that if there is "... substantial likelihood that the disclosure of the omitted fact would have been viewed by the reasonable investor as having significantly altered the 'total mix' of information made available" it is a material omission (TSC Industries, Inc. v. Northway, Inc., 426 U.S. 438 (1976)). A critical element here is the nature of the

"reasonable investor" and what such an investor considers "reasonable." This is a moving target. For example, corporate governance was not considered "material" prior to the Enron and WorldCom crises in the beginning of the twentieth century. But the "reasonable investor" came to consider governance a critical value component of a firm and as such emerged as "material." Similar developments among the E and S factors have emerged and are rapidly also becoming central to what is considered materially reasonable. For example, the US Security and Exchange Commission recognized that certain firms' carbon emissions should be considered material and therefore publicly disclosed.

As significant actors in investment markets come to consider a host of E and S and G factors important, and the market, or significant segments of it, comes to take note of these views, these factors become material. That is, they are seen by the "reasonable investor" as adding or detracting from the value of corporate assets and financial instruments.

To put this process another way, to the degree that a particular belief comes to be widely held in a country, regionally or globally, it may become a material factor if those beliefs are significantly and "reasonably" shared among market actors. Thus, there is not necessarily a black-and-white partition between the "ethical" and ESG as material views. Indeed, oftentimes, ethical/SRI investment foreshadows (sometimes by decades) what later becomes "common knowledge" or common beliefs. The ethical and material approaches are often linked over time through looking at reputational risk (to individual firms or whole industries), market risk, and political risk. Ethical investment has often been called the "canary in the coal mine," as it can be and often has provided early warnings and red flags of problems afoot.

A driving factor behind the emergence of a materiality standard is that many if not most corporate ESG disclosures are not, in fact, useful for investment decision-making. For example, most banks release carbon data for their operations, but this is definitely not material to their value; it is entirely irrelevant from a material point of view. In sum, what the "reasonable investor" find

reasonably material has long since undergone and continues to undergo profound change.

### **Fiduciary Duty**

Closely related to the specification of materiality is the changing scope of fiduciary duty. While fiduciary duty as legal obligation is common to both many civil and common law jurisdictions, it is in the latter that it is more deeply and historically rooted. While particulars of fiduciary law vary by country, common law countries (e.g., the USA, Canada, South Africa, UK, Australia) all undergo an expansion of what fiduciary law entails. What is too often called “nonfinancial” (ESG) information is in fact better thought of as emerging financial (or not as yet financial) information since if it is material by definition it has financial value to the reasonable investor. As such if ESG is material, fiduciary obligation involves due diligence consideration as to its relevance in specific circumstances. For example, part of the fiduciary duty of care is the duty of impartiality, to treat one cohort of investors or pension fund beneficiaries equal to another. Thus, older individuals cannot be favored at the expense of younger ones. Therefore, climate change is likely to impact younger people more than older ones over their respective life spans. Investment strategies that ignore potential climate impacts would violate the duty of care. In sum, the duty of impartiality is an emerging fiduciary duty directly related to ESG factors.

### **Reporting Standards and Integrating Reporting**

As the desire for standardized reporting increases, it intersects with the development of integrated reporting (IR). IR is the joining of a traditional annual corporate report with an ESG-SRI sustainability report. Some corporations have begun this, although the content of these IRs varies dramatically, from truly integrated reporting attempting in a few cases to integrated relevant (material) E and S and G data into specific financials, operating and risk/opportunity metrics, to simply appending an ESG-SRI section to a traditional annual report. In either case, the underlying problem remains: what ESG-SRI sustainability data and developments should be disclosed and in what form(s). While

financial reporting varies across jurisdictions and with different accounting protocols, such data is broadly comparable. This is far from the case with ESG-SRI sustainability data. Consequently, integrated reports are only as good and comparably useful as is the standardization of the relevant (material) data.

As mentioned, in the USA, SASB has concretized and focused a form of disclosure based on US parameters, as SASB interprets them, of ESG materiality. Parallel developments have yet to develop in other jurisdictions, although in the EU there is mandatory ESG disclosure for large firms. Lacking are both standards and forms for such disclosure, effectively making comparisons difficult or impossible. Nevertheless, there are indicators that this may be a first regulatory step to fuller disclosure and standardization.

A related emerging challenge will be the third-party authentication and auditing of ESG disclosures, whether voluntary or mandated by government or other authorities.

### **ESG Data: Analysis and Analytics**

A significant challenge is emerging focused on the very nature of ESG/SRI data itself. This has at least two elements. The first is that ESG data providers, both major ones (e.g., Sustainalytics, MSCI, Thompson-Reuters) and more boutiques ones (e.g. Viego-Eiris, Reprisk), have radically different methods and category definitions for their data, making comparisons very difficult, if not impossible. There is a very low correlation among the different providers for both overall ratings and many of the specific categories (e.g., labor conditions of supply chains). Underlying this element is that the way data is collected and analyzed and a ranking/score developed is mostly a proprietary black box. The second challenge is time frame. Most data providers issue reports annually, with topical updates as judged important. Consequently, the analysis and rankings are typically 6 months to over year old when published. This is because most data providers use human analysts, which is both slow and relatively expensive and difficult to scale up.

An emerging alternative to human analysts is data analytics. This approach uses the existing

artificial intelligence (AI) technology to sift through the vast amounts of data on corporate behavior available on the web, most of this data being in the form of “unstructured” data, that is, text. Technologies can read this data using natural language processing, analyze it algorithmically, and create a numeric data point for each individual piece of data. The result is a time series for various categories making various quantitative analyses useful in a manner previously not possible using human analysts. Using AI is highly scalable and far less expensive than the human analyst approach and is potentially much more transparent as to sources and methods. TruValue Labs/Insight360, a new ESG data provider, is currently taking this approach to ESG data analysis, but one would expect others to adopt a similar approach as a major emerging trend.<sup>1</sup> Yet common to both the human and the AI analytics approaches (or some amalgam of the two) remains the problem of categories and weighting, as discussed above. This problem is likely to be the focus of stock exchange listing requirements, accounting standards organizations, and regulatory actions by government.

### ESG Investment Strategies

A recent white paper by the Principles for Responsible Investment (PRI) enumerated five major emerging ESG investment strategies:

- *Fundamental* focused on topics such as labor standards’ impact on revenue and discount rates, ESG’s impact on beta (the market as a whole, its “ESG efficiency”), and materiality and its impact on tax avoidance.
- *Quantitative* focused on issues such as ESG’s correlation with volatility and returns and ESG portfolio construction and risk mitigation using a materiality profile (e.g., based on SASB).
- *Smart beta*, that is, factor investing, focusing on specific E or S or G elements such as a smart water index or using corporate governance insights for investment. This approach is also called alternative beta or strategic beta.
- *Passive (indexation)*, that is, using some form of ESG to weight or exclude specific firms such as a low carbon index. This can easily overlap with a smart beta approach.
- *Impact investing* which is highly focused on a specific project to produce both investment (either at or somewhat below market risk adjusted) returns and a social benefit. Example would be low-income housing and clean energy access for low-income communities.

In addition to these five PRI approaches are some emerging variants such as ESG momentum investing which attempts to identify specific firms likely to make significant progress on achieving specific E or S or G goals but currently may underperform some ESG benchmark. A version of ESG smart beta is an ESG tilt that overweighs high(er) ESG performing firms in a portfolio and/or underweights poorly performing ones (e.g., fossil fuel producers). It should also be noted that the current trend to significantly underweight certain sectors (e.g., fossil fuels) or specific industries (e.g., coal) or to entirely exclude them from an investment portfolio is growing.

In addition to ESG investment strategies, an important trend is the large growth of ESG investment across asset classes, e.g., green bonds, private equity, and infrastructure.

From a different and significant angle, there is an emerging among some ESG proponents (as well as the US Federal Reserve in Boston and San Francisco) a focus on ESG and systemic issues. Some of this so-called investment integration approach overlaps with trends already discussed, so this will only briefly mention additional three areas. The first is a focus on how to achieve long-term value creation, rather than shorter-terms gains (e.g., ESG alpha seeking). The second is the adoption of a universal owner perspective (for larger institutional investors), which means in particular viewing the investment portfolio holistically. Thus, explicitly taking into account, for example, of how externalities generated by firms in a portfolio impact other firms held, and finding a means to calculate this and account for it. It also suggests that large diversified (and especially passively held) portfolios in

<sup>1</sup> The author is affiliated with TruValue Labs.

the long-term cannot outperform the economy as a whole, so they have a financial and economic interest in how the economy performs. The third factor is a focus on what has been called investment stewardship, a form of oversight aiming the long term, bringing together corporate governance engagement, proxy voting, ESG integration, and a universal owner perspective.

Underlying these elements, the systemic issues of concern are climate change and global financial stability (as well as the role of the financial sector in sustainable economic development generally). The idea is that to date, much ESG analysis has not adequately taken into account systemic issues. This system approach sees an evolution in the management philosophies of large diversified portfolios from the early twentieth century. At first, the focus was to avoid “risky” securities/equities; then changing by the mid- to late-twentieth century to a focus on diversification and risk management informed by modern portfolio theory. Currently the investment integration approach considers feedback loops between portfolio investment decisions and systemic issues which in part may be the result of those very decisions.

### **ESG and Performance: Correlations and Causation**

In the last few years, an increasing number of both academic and practitioner ESG studies examining investment and financial performance and returns have been published. The large majority of these studies, using a variety of methods, definitions, and data universes, have reached parallel conclusions that at minimum ESG/SRI investing does not harm financial returns, and in some cases ESG (or E and S and G, disaggregated) outperform relevant risk-adjusted benchmarks. Taken together, these many dozens of studies (as well as meta-studies) have had significant impact helping to propel ESG into mainstream investing. This is obviously a complex topic, but two examples are illustrative. Academic research indicates that strong governance structures in a firm have led to

reduced default risk (e.g., lower credit default spreads) and lower bond yields, therefore less expensive access to capital. Similarly, other academic researches suggest that when using a SASB materiality lens, firms’ equity price and volatility (beta) are superior over a 20-year period than those with lower materiality-based ESG scores. The same study found cost of debt lower for higher rated (materiality based) ESG.

There is currently much debate about whether such findings are correlations (albeit very important ones) or whether ESG factors themselves may be causative. Evidence to date is highly incomplete, complex, and debatable. We would expect to see the growth of a variety of studies approaching this important topic in a host of ways.

### **ESG and “Beta Activism” (Corporate Governance Activism)**

Governance engagement (or activism) began in the late 1980s in the USA (and somewhat earlier in the UK). On the whole, this meant that an individual investor (usually institutional and usually very large ones) takes action using a variety of means (e.g., publicity, proxy voting and initiation, meeting with top executives and independent board members.) Far more often than not, institutions acted on their own, at best loosely communicating and occasionally coordinating among themselves. This form of corporate governance activism was effective in some regards and less so in others. What are emerging are forms of more coordinated engagements and other governance actions. It is often termed “beta activism” or “beta engagement” because it either aims to or has the effect of impacting the whole market (beta). The goal is to coordinate actions among investors, both in one country and increasingly across nations. Not only is greater coordinated action growing, but the scope of such actions is as well. For example, issues such as board diversity and problems associated with long-tenured board members move to the forefront in addition to the older issue such as proxy access and board declassification (staggered board terms rather than

annual elections). Many of the newer focus issues are long(er) term in nature, e.g., pay gaps between the top executives and the median employee pay, climate change.

As most equity ownership is highly concentrated among the largest institutional owners (e.g., Blackrock, Fidelity, Vanguard), these institutional investors often hold critical voting power on proxy issues. As some of these investors (e.g., Blackrock, Fidelity) typically vote with management on all proxy issues well over 95% of the time, there is emerging pressure on them to vote in accordance with their published ESG policy statements, according to many of their critics. For example, voting for climate disclosure or accounting proposals at major fossil fuel firms (e.g., Chevron, ExxonMobil). In response to this criticism, some of these large investors dismiss the concerns as based on political, ethical, or social and not be imposed on their clients' interests, as these institutions view them.

## Conclusion

SRI/ESG since 2014 in the USA (and earlier on, e.g., Europe, Canada, and the UK) was at a tipping point. Having been a growing niche in the investment markets prior to 2014, it has not merely become (more) mainstream but increasingly has come to be regarded as a means to achieve financial outperformance. It has also become a way to invest in or construct portfolios with lower volatility (and on a risk adjusted basis) yielding greater return (in some cases) as well. Although such empirical findings run head long into the investment trope that greater volatility (a proxy for risk) brings greater return, such evidence is emerging that there is more to SRI/ESG than at first meets the eye. This in turn may suggest a rethinking of traditional investment understandings. This essay has reviewed major trends in the emergence of SRI/ESG as increasingly not only in the mainstream investment world but likely having a significant impact on that world, changing elements of received wisdom.

## Empathic Leadership

Samuel M. Natale and Anthony F. Libertella  
Robert. B. Willumstad School of Business,  
Adelphi University, New York, NY, USA

## Synonyms

Emotional intelligence; Empathy; Leadership; Social intelligence

## Definition

To garner the essence of empathic leadership initially requires an individual to discern the meaning of empathy. Empathy, which necessitates a deeper understanding toward others, is the ability to identify with their perceptions, feelings, and encounters (Batson et al. 1995). In relation to leadership, empathic understanding is the capacity to be aware of the needs, feelings, and motives of others and to develop the appropriate advancement plan to facilitate the fulfillment of those identified needs (Goleman et al. 2002; Goleman 2006). Concomitantly, empathic leadership enhances the leader's capacity to comprehend, to experience with, and to be perceptive to all internal and external stakeholders' concerns and feelings, which in turn builds trust, collaboration, and connectivity in relation to the overall organization. The interest in empathy within the leadership dynamic fosters a paradigm shift from the traditional theories that emphasized the rational basis of leadership, as opposed to its humanistic construct.

## Description

In the last quarter century, a paradigm shift has occurred in business, whereby the utilization of empathy in leadership decision-making has proven to be beneficial to organizational

effectiveness. However, early leadership theories disregarded or dismissed the application of empathy in leadership decision-making in favor of a more objective and measurable approach (Pink 2005). Accordingly, empathy is viewed by other researchers to be a combination of both a cognitive state and an affective state, whereby leadership decision-making is skewed toward baseless feelings and perceptions (Batson 2010). This disregard for empathy as a value-adding leadership construct is due to the need of many organizations to pursue tangible metrics such as shareholder value and maximization of profits (Freedman 1970). Patnaik and Mortensen (2009) assert that the mentality of “profits over people” with regard to leadership decision-making and policy-shaping has led to the neglect of understanding people’s underlying interests.

Recently, the advancement of neurobiological and psychological studies provided deeper insight into the nature of empathy and its symbiotic relationship to leadership. Neuroscience research has been paramount in demonstrating the power of brain functioning in enhancing empathic practices. The ability to empathize with others has been tied to more biological functions, such as the brain and limbic system, whereby empathy is impacted by mirror neurons and brain circuits that enable individuals to innately express empathy (Brothers 1989; Patnaik and Mortensen 2009). From a psychological perspective, Salovey and Mayer (1990) introduced empathy as a component of emotional intelligence, allowing one to “gauge accurately the affective responses in others” and react appropriately to those aforementioned responses. Daniel Goleman, who is considered to be the foremost advocate of and expert in the area of emotional intelligence, furthered the research on the subject by both highlighting and emphasizing the interdependent relationship between empathy and leadership. Through his seminal work, *Emotional Intelligence*, Goleman (1995) shone a spotlight on the importance of taking a more humanistic approach to leadership. In his work, Goleman suggests that empathy is the most important facet of emotional intelligence with regard to management.

## Dimensions

Goleman’s research introduced a holistic foundation with regard to empathy and the leadership dynamic. Goleman and his colleagues assert that leaders with the capacity for empathy in their decision-making can assist with fostering a sense of “social responsibility” and “social awareness” (Goleman 2006; Goleman et al. 2002). Goleman further examines the dimension of empathy in leadership by discussing the notion of “the empathy triad” and the pivotal role the triad plays with regard to effective leadership decision-making (Goleman 2017). Components of the triad entail the following: “cognitive empathy,” the leader’s ability to intellectually be aware of others’ feelings; “emotional empathy,” an affective state whereby the leader relates to the feelings of others; and “empathic concern,” which entails a leader’s ability to recognize the needs of others and to establish an action plan to satisfy these needs. Effective empathic concern enlists leaders to maintain a controlled response in addressing the feelings and needs of others. Goleman suggests that the holistic framework of the triad creates connectivity, trust, and loyalty that ultimately enhances the organizational leadership construct.

Goleman (2017) posits that “executives who can effectively focus on others are easy to recognize. They are the ones who find common ground, whose opinions carry the most weight, and with whom other people want to work. They emerge as natural leaders regardless of organizational or social rank.” In a much broader dimension, the leader’s quest is to incorporate the empathic paradigm throughout the organization in order to create and sustain the relationship with stakeholders to achieve organizational success (Patnaik and Mortensen 2009). Recently, it has been illustrated through various case studies (Natale et al. 2011, 2014) that the application of the empathic dimension underlies the success of a number of today’s significant leaders. In sum, these case studies have shown that the capacity for empathy created a deeper connectivity between leaders and their stakeholders, whereby the stakeholders felt that all of their concerns and needs were considered and mutually understood.

Furthermore, the case studies demonstrated that the application of the empathic dimension enabled those leaders to develop the open communication necessary for their organizations to enhance its brand and differentiate itself from the competition. In his book *Leading Matters: Lessons from My Journey*, John Hennessy (2018), former President of Stanford University, asserts that “empathy should always be a factor in making decisions and setting goals. Empathy represents a crucial check on action – placing a deep understanding of and concern for the human condition next to data can lead to decisions that support the well-being of all.”

## Importance

The capacity for empathy in leadership impacts today’s work environment in a number of ways. A leader’s use of empathic thinking in decision-making can assist with the retention of skilled subordinates, have a direct impact on organizational performance, and promote general “business health,” which is crucial in today’s business environment (Goleman 1998a; Higginbottom 2018). Further, empathic leadership promotes effective collaboration and teambuilding (Goleman 1998b).

Deutschendorf (2018) asserts that empathic leaders have more loyal, better-working, and highly engaged staff. Loehr 2016 further indicates that inculcating an empathic focus to the leadership construct results in building strong relationships, reducing conflict, inspiring others, and understanding how others perceive you. Furthermore, relationship building through empathic leadership allows the leader to understand the viewpoints of outgroup members, which is necessary for the inclusion of all perspectives in organizational decision-making (Northouse 2018). In a research study performed by the Center for Creative Leadership (Gentry et al. 2007), it was found that increased empathy in leadership is positively correlated to job performance. The study concluded that “managers who show greater empathy toward direct reports are viewed as better performers in their job by their bosses.”

The importance of empathy in decision-making at a leadership level has been exemplified by significant leaders from diverse fields. Recently, comparative case studies have explored the practical benefits of interpreting empathy in leadership (Natale et al. 2011, 2014). These case studies have illustrated that a leader’s people-centric focus that emphasized an “empathic engagement orientation” can prove to be highly beneficial to the financial well-being of the organization. More notably, the case studies have demonstrated that “significant financial rewards and the use of an empathic approach to leadership are not exclusive.”

## Limits

In lieu of the benefits and importance attributed to empathy in the leadership construct, recent research have examined the limited nature of empathic leadership. Korn Ferry Institute, in its studies, found that executives who overemphasize empathy while disregarding other elements of emotional intelligence have noticeably less engagement than those executives who have a more balanced EQ (Lewis 2015). The study goes on to propose that executives who overstress empathic understanding are more likely to lose sight of core goals/objectives. Overall, if a leader puts too much emphasis on empathic understanding, they may not be able to dedicate the appropriate time to all of their organization’s needs.

Waytz (2017) further explored the limitations of applying empathy to the leadership dynamic by highlighting three key limits that entail the following: as empathy burnout resulting from “compassion fatigue,” as a limited resource whereby less empathy is available for other individuals or situations, and as a loss of ethical focus caused by the need to connect with and protect “insiders.” If a leader is overly invested in understanding the needs and perspective of others, they may overlook bad behaviors in favor of sharing interests. As a result, leaders who are overly empathically attached toward others may produce unintended negative results, especially when decision-

making involves issues such as organizational change and performance reviews.

## Developmental Dimensions

Empathy as a complex phenomenon is somewhat challenging to teach. Nevertheless, Goleman (1998a) indicates that empathy is not simply inborn but can be developed with awareness, understanding, patience, and deep commitment. During the past 25 years, emotional intelligence development programs have explored various methodologies to enhance a leader's empathic capacity.

The Center for Creative Leadership indicates "leaders can develop and enhance their empathy skills through coaching, training, or developmental opportunities and initiatives" (Gentry et al. 2007). Research contends that empathy can be improved upon with the implementation of several distinct practices, such as "radical listening," forming bonds, seeing things from another's point of view, and seeking "entrepreneurial adventures" (Krzmaric 2014; Stobierski 2018). In addition, other developmental methodologies have been suggested to be effective in enhancing leadership with empathy, such as mentoring, coaching, and mindfulness/meditation practices (Goleman 1998a, 2011; Atkins 2014; David 2016; Harvard Business Review 2018). Ultimately, the type of methodology utilized by a leader for his or her empathic leadership development will be the one that works best for that leader's unique learning style.

## Conclusion

In conclusion, the symbiotic relationship between empathy and leadership becomes significantly important due to the factors of "rapid pace of globalization, the increasing use of teams, and the growing need to retain talent" shaping today's complex business environment (Goleman 1998a). More specifically, this complexity requires human connectivity and networking capabilities,

whereby empathic engagement enhances decision-making by leaders at all levels within an organization in order to achieve positive outcomes. As the business environment becomes further influenced by fluctuating macro- and microenvironmental forces, the continued exploration of empathic leadership and its effectiveness toward attaining organizational objectives is to be expected.

## Introduction

Organizational Justice and Corporate Social Responsibility (CSR) both have important effects on the functioning of organizations and the well-being of their workforces (Colquitt et al. 2013; Rupp and Mallory 2015). This entry briefly defines and reviews the foundational research on organizational justice (perceptions of fairness) and CSR (organizational actions taken to benefit stakeholders and influence the triple-bottom line of social, economic, and environmental performance; Aguinis 2011; Jones and Rupp 2018). Historically, organizational justice research has been conducted at the individual level of analysis while CSR has been traditionally studied at the organizational level of analysis. However, this entry takes an approach similar to that of Rupp (2011), which brings these constructs together within an employee-centered perspective. Such a perspective recognizes that employees (including potential employees) “look in” to consider how they themselves are treated by their employers; “look around” to consider how

the organization treats workers in general (i.e., justice climate); and “look out” to consider how their employer treats various stakeholder groups (such as local communities and the ecological environment; p. 80). This framework organizes the entry’s review of justice and CSR from the employee’s perspective.

This entry begins by defining organizational justice before covering its consequences, the reasons why individuals are concerned with organizational justice, and the factors that dictate the formation of justice judgments. Following this, it defines CSR and discusses why employees might care about CSR initiatives. Finally, it discusses the antecedents of employee CSR perceptions, as well as factors that mediate and moderate their effect on important outcomes.

## Organizational Justice

### Defining Organizational Justice

Organizational justice is commonly defined using four factors or dimensions: distributive, procedural, interpersonal, and informational justice (Colquitt et al. 2013). *Distributive justice* is concerned with the allocation of outcomes and is most commonly defined as equity of outcome allocations, which refers to the rewards and punishments that are distributed based on individuals’ contributions (Adams 1965). *Procedural justice* is concerned with the processes used to allocate outcomes and is typically defined through characteristics such as the control and voice individuals have within a process; the consistency of procedures; bias, accuracy, and ethicality within procedures; and opportunities to appeal outcomes of the procedures (Leventhal 1980; Thibaut and Walker 1975). *Interpersonal justice* refers to employee perceptions of fair treatment in social interactions (Bies 2015) and has been guided by criteria such as respect and propriety. *Informational justice* refers to fairness of communication and includes criteria such as truthfulness and justification for decisions (Greenberg 1993).

Justice researchers have argued that in addition to these four justice dimensions, the source of the just or unjust treatment also matters (Lavelle et al.

2015). While previous research has assumed specific justice dimensions were connected to a specific source (e.g., distributive justice was seen as stemming from the organization, while interpersonal justice was seen as stemming from one’s supervisor), more recent evidence suggests that different sources (i.e., supervisors, coworkers, customers, etc.) can influence perceptions about outcomes, procedures, and interpersonal treatment in the workplace (multi-foci justice; Rupp et al. 2014). This approach recognizes the different relationships employees can have with different parties at work and recognizes the complex ways in which perceptions can interact and be aggregated over time to form overall perceptions of organizational justice (Ambrose et al. 2015).

Finally, justice research has been described as taking either a social entities or events perspective (Cropanzano et al. 2001). The events perspective involves specific reactions to outcomes, processes, or interpersonal relationships that occur in the workplace. This approach reflects state-like reactions to justice events. In contrast, the social entity perspective reflects reactions to how one feels they have been treated in the aggregate (over time) by particular sources of justice (e.g., one supervisor, coworkers). This distinction fundamentally changes the questions that researchers can investigate and reveals the importance of understanding justice events, justice sources, and the dimensions that influence each.

### Outcomes of Organizational Justice

When expectations associated with any of the justice dimensions mentioned above are not met, injustice is perceived, and negative outcomes can follow (Colquitt et al. 2013). For example, justice perceptions are often positively associated with job satisfaction, performance, positive affect, organizational identification, trust, perceived support, and social exchange; and negatively associated with counterproductive work behavior, negative affect, and turnover intentions. Additionally, justice perceptions about a particular source are often associated with subsequent attitudes about and behaviors targeting that source, such as perceptions of supervisor fairness predicting leader-member exchange, perceived supervisor

support, and citizenship behaviors directed at the supervisor (Lavelle et al. 2015; Rupp et al. 2014).

### Content (Motivators) and Process Models of Organizational Justice

Content models look to evaluate why organizational justice is important to employees (i.e., the “why”) while process models refer to how justice judgments are developed (i.e., the “how”).

#### Content Models

Major content models include the *instrumental model* (Thibaut and Walker 1975), which argues that individuals care about justice since it allows them control over their outcomes and allows them to maximize benefits to the self; the *relational model* (Lind and Tyler 1988), which argues that fair treatment (or lack thereof) provides information to individuals about their standing in groups; and the *deontic model* (Folger and Cropanzano 2005), which argues that individuals also value fairness for fairness’s sake, and will punish transgressors even when they themselves are not involved in the situation. Cropanzano et al. (2001) further classified these theoretical perspectives in terms of human needs, spanning from instrumental to relational to moral (deontic).

#### Process Models

Process models focus on the justice perception formation process. Justice perception formation can include both conscious and automatic processing (Colquitt and Zipay 2015). Conscious processing requires a great amount of cognitive effort in evaluating the details that contribute to justice judgments. Conversely, automatic processing requires little effort because employees rely on cognitive heuristics and shortcuts to make justice judgments, making mistakes in judgments more likely. The degree to which an individual is likely to rely on conscious or automatic processing depends on the context. For example, if individuals are unable to obtain the information required to make a conscious judgment, then it is useful to rely on heuristics and previous experiences to form their justice perceptions. Additionally, in contexts where there is not a high level of urgency, individuals have time to evaluate all

sources of information available to avoid making inaccurate judgments.

An example of a specific process theory that relies heavily on automatic processing is *fairness heuristic theory* (FTH; Lind and van den Bos 2002). This theory states that individuals use any (incomplete) accessible fairness information to form their justice perceptions and that these justice perceptions, in turn, are used as a heuristic to aid employees in determining future attitudes and behaviors. These heuristics allow employees to mitigate uncertainty and stand in for assessments of trust, which are more challenging to determine. An example of a process theory that relies more heavily on conscious processing than FTH is *fairness theory* (Folger and Cropanzano 2001). Fairness theory argues that an injustice event prompts individuals to consider different counterfactuals (possible alternative events). Specifically, employees are thought to consider whether a different outcome that *would* have lessened harm was possible; whether the party being held responsible for the injustice *could* have influenced the outcome; and whether the outcome *should* have been different based on moral or ethical standards. Together, these counterfactuals allow employees to determine if a party can be blamed for an injustice.

#### Third-Party Justice Perceptions

Research has also found that individuals do not need to be experiencing mistreatment themselves to have strong reactions to observed mistreatment. For example, Turillo et al. (2002) found that study participants chose to punish individuals who previously intended to distribute outcomes to others unfairly or treat others in an interpersonally unfair manner even when the study participants had no reason to identify with the unfairly treated party and when the punishment required a sacrifice on the participant’s part. This line of research is important because it provides a lens that merges organizational justice and CSR. Specifically, this perspective discusses how individuals who are not involved in justice events can be influenced by these events and how employees can form judgments about the organization’s externally directed behaviors.

## Corporate Social Responsibility (CSR)

### Defining CSR

CSR refers to voluntary organizational acts that benefit society and are not included in the organization's mission or required by an authoritative entity (McWilliams and Siegel 2001). While previous research has largely focused on macro-CSR (i.e., organizational level outcomes), research is amassing on employee perceptions of and reactions to CSR. Inherently, the responsible source for CSR behaviors is the organization; however, the target or beneficiary of CSR behaviors can change (Farooq et al. 2017). Specifically, this refers to two dimensions of CSR that have been explored in past research, internal and external CSR. Internal CSR refers to behaviors that benefit employees; conversely, external CSR refers to behaviors that benefit external stakeholders, such as the community, environment, or consumers (El Akremi et al. 2019). Externally focused CSR can include contributing to social causes, engaging in environmentally conscious behaviors, or providing support for consumers.

### Antecedents of Employee CSR Perception

Agunis and Glavas (2019) developed a conceptual framework that identified the factors that influence how employees make sense of CSR (experience CSR and find meaning through it), organizing these into intra-individual, intra-organizational, and extra-organizational factors. At the intra-individual level, they suggested that factors such as values (environmental and communal), work orientation, and moral identity allow for employees to make sense of CSR behaviors. At the intra-organizational level, the structure of the organization can influence employee perceptions of CSR. Specifically, employee perceptions can vary based on whether CSR is present in organizational strategy (i.e., embedded vs. peripheral) or from where the initiatives are being implemented (i.e., top-down vs. bottom-up). At the extra-organizational level, factors included national culture, family, and external stakeholders.

### Outcomes of Employee CSR Perceptions

Research has suggested that employee CSR perceptions predict a number of important employee-relevant outcomes. Examples include organizational attractiveness, job pursuit intentions, organizational identification, job satisfaction, work engagement, creativity, organizational commitment, organizational citizenship behaviors, and performance (see Rupp and Mallory 2015).

### Motivators, Moderators, and Mediators

Similar to the motivators for caring about organizational justice, Gond et al. (2017), building off the work of Aguilera et al. (2007), reviewed the motives that drive employees to care about and engage in CSR, grouping them into instrumental, relational, and moral categories. That is, individuals engage in CSR to maintain power and control (instrumental drivers), to interact with people and obtain recognition (relational drivers), and to contribute to the greater good, such as to their community or the environment (moral drivers). Jones and Rupp's (2018) review of the literature utilized this framework to identify mediators (e.g., expected treatment, organizational pride, perceived value fit, which represent instrumental-based, relational-based, and moral-based drivers, respectively) and moderators (e.g., communal orientation, distributive justice, collectivism) that explain and influence the relationship between employee perceptions of CSR and work outcomes.

To give an example of an important moderator of CSR perceptions, Jones and Rupp (2018) identified culture as a relational-based moderator of the relationship between CSR and employee outcomes. Agunis and Glavas (2019) also suggested that the relationship between CSR and experienced meaningfulness through work would be stronger for collectivistic cultures as compared to individualistic cultures. Empirical work has suggested that the specific manner in which collectivism and individualism moderate CSR effects depends on the type of CSR. Specifically, Farooq et al. (2017) found that collectivism moderated the

relationship between external CSR and organizational identification, where greater levels of collectivism increased the effect. Conversely, individualism moderated the relationship between internal CSR and organizational identification, where greater levels of individualism increased the effect.

Finally, some research has suggested that specific moderators can also influence which mediators are relevant. Farooq et al. found that pride in the organization mediated the relationship between external CSR and organizational identification, while perceived respect mediated the relationship between internal CSR and organizational identification. El Akremi et al. (2018) found that perceived organizational support positively mediated the relationship between CSR and organizational affective commitment.

## Conclusion

This entry discussed organizational justice and corporate social responsibility. After defining each construct, it discussed the outcomes of each in addition to the motivators for caring about each. The organizational justice section discussed the factors that influence the steps through which organizational justice perceptions are formed (process theories); and the corporate social responsibility section discussed the potential antecedents of CSR perceptions and the mediators and moderators that influence their effects. The research reviewed demonstrates the importance of both organizational justice and CSR as organizational constructs for both research and practice.

## Employer Loyalty

Kemi Ogunyemi

Lagos Business School, Pan-Atlantic University,

## Introduction

Loyalty is a quality by which one party upholds the interests of another whether the other party is present or absent. At the very minimum, it means fulfilling what one owes to others explicitly or implicitly. While loyalty is not always acknowledged when present, the lack of it is quickly tagged as disloyalty. A loyal building contractor would work to fulfil the terms of the construction. A loyal employee would maintain confidentiality about the company's trade secrets even if offered

money by the competition. Going beyond the minimum, loyalty means standing by the other person even when it is not a duty or when it means going out of one's way. Beyond the minimum, it often includes some form of affective commitment, or adherence and devotion (Coughlan 2005). A loyal friend would try to avoid publicizing negative information about his or her friend even if it is true. A loyal customer might buy a particular company's products or services even when they are more expensive than a competitor's. Whether from the perspective of employers or from that of employees, loyalty would ordinarily be expected at both levels (Ogunyemi 2014).

Notwithstanding the foregoing, it must be clarified that loyalty is not necessarily a good thing especially when it is blind; rather it is a quality that needs to be qualified by the extent to which its cause or its recipient is noble. Thus, for example, being loyal to a gang of thieves could only be admired in an abstract manner. And loyalty that prevents an employee from blowing the whistle to the appropriate authorities, when all internal resources have been exhausted to counter a harm being done to the common good by a company, is questionable. Similarly, the loyal agent's argument remains unacceptable as an ethical position when proffered in the defense of criminal or unethical actions, as shown in the famous example of the Nuremberg trials where the justification of "I was only following orders" was found inadequate and could not absolve an individual of personal responsibility. These considerations clearly indicate that loyalty has limits and that senior administrators especially cannot escape being held responsible for wrongdoing by appealing to a duty of loyalty to their employer.

In general, however, and keeping in mind these restrictions, employees have usually been called upon to display loyalty to their employers. If their loyalty fails, the business usually suffers. Yet, possibly the most effective spur for employee loyalty is employer loyalty. Employers who exhibit no loyalty to their employees should not be surprised if their employees are not loyal to them. In this entry, loyalty is discussed with an

emphasis on employer loyalty and ways to demonstrate it, to identify and address its vulnerable points, and to build it by bridging gaps in communication. Toward the end of the entry, some costs of employer disloyalty are flagged. The more familiar concepts of employee disloyalty and loyalty serve as a starting point for the discussion.

## Employee Loyalty

Among the most commonly found instances of employee disloyalty are deliberately not cooperating with their work teams, leaving the employer in the lurch, refusal to be creative at work, information hoarding, reluctance to go the extra mile, apathy in the face of a crisis, non-dependability, lack of interest in self-development, lack of willingness to develop subordinates, lack of dedication at work, and choosing personal over organizational goals when faced with situations where the two interests conflict.

Employees who quit without notice, who only do their routine jobs and would not apply their minds or their imagination to the task at hand in order to avoid extra work, who show no concern when the company is going through a tough crisis, who cannot be relied on to do their best for the company if there are customer complaints or if a query comes from regulatory authorities, who deliberately dampen the mood of others at work, who are sent to training programs and avoid learning, who try to keep down their subordinates as if these were competing for their jobs, and who have their own agenda to carry out and spend company time and resources pursuing it – all these are identifiable as cases of disloyalty that could hamper organizational progress.

Yet, it is difficult to encourage employees to take care of the interests of the company at possibly their own cost, if they are not reasonably sure that their own interests are also the company's interests. The above is one of the reasons why it is important that employers are loyal to their employees.

## Loyalty from Employers

Instances of disloyalty of employers to their employees are as common if not more common, yet much less attention is given to them. These incidents undermine employee morale and productivity. Employer loyalty, as explained in the introduction, should mean going beyond merely fulfilling contractual obligations and should extend to some understanding of shared value, in a long-term transaction which leads to mutual adherence and devotion (Coughlan 2005). The following 11 subtopics depict ways employers should show loyalty; their headings could also serve as a list of the characteristics of employer loyalty which show the employer's concern for the legitimate interests of the employee.

*Solidarity:* Employees expect their employers to back them up when there are problems with customers or with suppliers. Whether these stakeholders are internal or external to the organization, they expect "dirty linen to be washed at home." Even when they may be at fault, they count on the boss's loyalty not to upbraid them publicly, much in the same way as employers expect employees not to whistle-blow without exhausting all internal remedies before resorting to a public disclosure. Employees are happy with superiors who support them in front of clients or clarify issues on their behalf when there are disputes with clients.

*Fairness and Consistency:* Employees expect their employers to provide adequate resources for the tasks to be done and, if these are not available, to tailor their expectations of the output in proportion to the input and not ask the employees for a miracle. Employees also expect that loyalty to them will make the employers acknowledge and appreciate it when they have actually wrought a miracle by producing output with less than ideal input.

*Goal Alignment and Fit:* Employees expect their employers to be interested in promoting a fit between their personal goals and the organizational goals. When one person is out of alignment, it could affect that person's engagement with the job and, consequently, others who work with him or her as well as the organization's goals are negatively affected. Employees would find it

difficult to continue to invest themselves in organizations that do not invest in them in return.

*Recognition:* Employees expect their employers to acknowledge effort even when the results do not come. When organizations reward only results and never the effort put in, it can lead to a perception of injustice. Organizations that measure effort as well as results find ways to be fair to all their workers. When people's contributions are not acknowledged or rewarded for long, they could become bitter and indifferent to the organizational goals.

*Honesty:* Employees expect their bosses to be honest with them when communicating. For example, they expect employers to admit mistakes when appropriate and not blame their subordinates instead. Also, employees expect their bosses to acknowledge, where appropriate, great ideas that have come from employees rather than themselves. Nothing undermines trust in this relationship more than situations when an employee comes up with a brilliant solution to a problem and the boss takes all the credit (and glory) for the idea without acknowledging its source. Berkley and Watson (2009) speak about accountability as owed to employees by the organization and the need to have it reinforced by legislation.

*Sincerity and Directness:* Employees expect their employers to tell them things directly, to be straight with them, and to tell them the truth. If an employer gets at the employee through a third party rather than directly, the employee may feel betrayed.

*Development and Freedom to Create:* Employees expect to be treated as intelligent beings, to have their ideas listened to, acknowledged as good when they are, implemented when reasonable, and appreciated as their contribution to the firm. Employees expect to grow on the job, that is, to be given opportunities for professional and personal development. They sometimes also expect to be given an opportunity to be moved from one job to another, so as to avoid the monotony of repeating the same operations year in year out. Thus, a global leading firm goes so far as to regard enjoyment of work as an "actionable right of every employee" (Simon 2009, p 262), and Rosanas and Velilla (2003) suggest that

employers should be interested in employees' career progress and personal development.

*Respect:* Employees expect their employers to address them respectfully. Non-respectful language is noise to communication and obstructs it. Everyone knows how critical clear and unambiguous communication is in a relationship. Mutual respectfulness, both verbal and nonverbal, breeds cordial interaction, and this is good for the climate of the organization. The more acrimonious a relationship is, the more difficult it is to elicit loyalty from the employee.

*Representation:* At meetings or other interactions with higher-level officials of the company, employees expect their bosses to be their voice, so that, whether it is resources, responsibilities, or culpabilities that are being allocated, they have someone to represent their interests. Similarly, they expect loyalty from those who represent them at the top-level meetings where promotions or protection may be at stake.

*Discretion:* At times, employees may say something to their employers in confidence. Even when they lack the temerity to indicate that such communications are confidential, they do expect their bosses to be discerning enough not to later use such communications to the employee's disadvantage.

*Dependability:* Employees expect their employers to be there for them in times of crisis, much in the same way their employers expect them to remain committed during the company's difficult moments. When the employer does not support an employee when there is a problem, it may strengthen turnover intentions if the employee has some alternatives.

The above 11 points provide some insights as to ways in which employers can show loyalty to their employees. Through each one of them, a basis is established for the employee to reciprocate with loyalty.

### **Reciprocity: The Need to Recognize and Resolve Loyalty Risks and Conflicts**

The importance of having a reciprocal link between the expectations of employers and

employees cannot be overemphasized. While knowledge of how employer loyalty fuels employee loyalty is essential (Ogunyemi 2014), awareness of the converse is also instructive. Employer disloyalty fuels employee disloyalty, and, therefore, employee loyalty is difficult to sustain when it is not reciprocated. Realizing the importance of meeting employee loyalty expectations, employers should be quick to recognize opportunities to display loyalty and make use of them. Loyalty risks and conflicts resulting from gaps in employer loyalty should therefore be quickly flagged and resolved, thereby reassuring employees. For example, a football coach should look out for potentially difficult relationships between him or her and the team members and attend to things immediately. A leader does not allow wounds to fester.

### **Clarity and Consistency in Communication: A Tool to Foster Mutual Loyalty**

Communication is belied by action when the two are inconsistent. Employees that do not observe behavior that they would ordinarily expect in a climate of trust and loyalty will adjust to what they find in reality with reservations about the degree of loyalty they should owe to the firm in return. In order to communicate the clear and unambiguous message of employer loyalty, employers may need to smoothen out any inconsistencies that may inadvertently exist in their current messaging patterns within the organization. They need to confirm whether they are saying what they want to say.

Moreover, employees expect their bosses to be loyal not only to them but also to the company's avowed culture, values, and principles. Any perceived betrayal of loyalty expectations due to incongruence in verbal and nonverbal messaging leads to cracks in employee loyalty. Some instances of such messages are discussed below:

The "we are customer-focused" message. Companies sometimes insist on the need for employees to have an "internal customer" focus, meaning that they should attend to their

co-workers as if they were their customers. However, this concept is usually emphasized horizontally but not vertically, such that among themselves, employees are pushed to see their colleagues as customers to whom they owe good service, but bosses are not asked to look at their subordinates as customers whom they have to serve. The message become increasingly ambiguous if the leaders fail to walk their talk.

The **“customer feedback is important to us”** message: The customer or employee should be asked – how did we serve you today? If employers pass the test, the benefit of having well-served employees will be transferred to the customer. If they do not, it becomes clear that the top management are not role models and that employees are somehow expected to have split personalities: wolf for their colleagues/subordinates and lamb for the customers.

The **“when something has gone wrong, admit it”** message: Seldom do managers admit their mistakes boldly without fear of losing face. If they are unable to articulate statements such as “I was wrong...” then it is also difficult for employees to reciprocate.

The **“everyone is equal; it does not matter who you know, we judge on merit”** message: Bosses who try to pass across this message and yet fill the company’s vacancies based on personal recommendations can also create an atmosphere of distrust and disloyalty in the organization. When nepotism becomes the norm, once a new employee comes in, the old ones try to find out “who does he or she know?” in order to know how to treat him or her. The grapevine fills in communication gaps with gossip, while bootlicking and backstabbing flourish and undermine mutual loyalty.

The **“we are fair minded”** message: It is important to watch out for lapses of fairness or incidents of discrimination, e.g., in workload distribution. It is also good to watch out for the temptation to label employees and not give them second chances after a first impression is made. Every effort should be made to limit subjectivity in appraisal systems even if it cannot be eliminated.

The **“we care about you”** message: This message is underscored by making available the tools

and other resources that each employee needs to get his work done, and by giving explanations whenever this is not possible. It also involves active interest in the employee’s development. If employees never hear of a plan for their development, they will find it difficult to believe that the company cares about them. Companies that take the trouble to give feedback to people who are not hired after a recruitment process already stand out as companies that empathize and go an extra mile. These companies are more likely to find loyal employees that will go an extra mile for them.

In the same vein, the manner in which layoffs are done can show both to outgoing employees and to those left behind how much the company cares. For example, a certain company invited targeted employees for a meeting outside the office and informed them that they were being let go. As they talked, codes and passwords were already being changed and, shortly after, their personal effects would be handed to them at the front gate. This approach showed little respect for the persons involved and little or no sense of loyalty toward them. The dismissed employees felt they had been used for as long as they were useful. Furthermore, their colleagues, who did not receive this treatment, were nevertheless affected. A loyalty poll taken before and after would have gauged the effect empirically. Badly handled layoffs have adverse effects on knowledge management resources, on the perception of how ethical the organization is, and on the loyalty of those left behind.

The **“people are our most important assets”** message: Over time, people tend to experience greater adherence to leaders whose actions reflect their words and therefore command respect and commitment. Employers can earn the commitment of employees by taking concrete steps to show that they care for employees rather than only saying it.

## Costs of Employer Disloyalty

The costs of employer disloyalty are real though not easily quantified. Cases abound of disgruntled employees using company resources for their own private practice and stealing clients from the

company. Sometimes employees abstract cash and materials, as happens in beauty salons, pharmacies, household help, or cooking in institutional kitchens. Other times employees take away customers, either selling their own wares within the employer's premises (e.g., CD shops) or outside the premises (e.g., photographers; opticians, tailors). The latter option is often also accompanied by stealing the employers' materials. These acts are not always or solely caused by employer disloyalty; however, it is easier for an employee to dispense himself from putting his employer's interest above personal preferences when he perceives that the employer does the same to him. It is also easier for badly behaved employees to excuse their bad behavior and to persist in it when they feel badly treated by their employers.

Time spent off the job is also time lost to the organization: employees selling goods to colleagues during worktime, doing online jobs, answering unnecessary emails, browsing for general information or visiting online social networking sites, chatting on social media with friends for hours, searching for jobs, rewriting their CVs, etc. At a less tangible level, brand theft could happen when the employees use official connections for personal purposes, e.g., to get preferential treatment for themselves or their families. It would be difficult, however, to accuse such an employee of disloyalty in cases where the office also uses the employee's personal networks for selling their products and/or services.

When employers steal employees' private hours with the use of intrusive devices such as smartphones and tabs, weekend work schedules, and late closing hours, employees may rebel, consciously or unconsciously, by frittering away the actual working hours and taking sick leave as often as possible. Consequently, employers have to spend time and energy scaling the walls of internal resistance thrown up by non-loyal and disloyal employees, and this can be a significant cost to the company.

Employees may leave the organization without being guilty of disloyalty, much the same as employers may terminate the employment contract without such an accusation being levelled. The critical factor may lie in the way the

severance/separation is effected. If the manner of disengagement does not reflect employer loyalty, the employee leaves bitter, takes with him knowledge acquired in the course of employment, and does not care about transmitting it to the next person. Moreover, he may transmit it to a competitor, without a thought about the possible harm to his previous employer. Recruitment, on-boarding, and retraining expenses also matter. They affect productivity, continuity, customer loyalty, and many other variables that have a direct impact on the company's bottom line.

These are some of the costs that a company incurs when it chooses, strategically or negligently, to be disloyal to its employees.

## Conclusion

Within this entry, the employer-employee relationship has been acknowledged as one where mutual loyalty is expected, and that can be enhanced by experiences of loyalty or damaged by experiences of disloyalty. In the latter situation, many problems may ensue. Employees may have good ideas and conceal them. Knowledge sharing, transfer, and management become difficult, especially in knowledge-intensive companies such as those in the consulting industry. People may shirk work when they can get away with it. Staff foment may have difficulties within their areas of control and obstruct the work of other team members, other teams, or the whole company. Some may leave the organization, causing recruitment and comprehensive training to become necessary. The organizational culture may be negatively affected.

In conclusion, loyalty expectations are not a one-way road to be traversed only by employees; reciprocity in loyalty is beneficial to both parties. Since employer disloyalty can have a negative impact on productivity, it is useful to be able to identify the types of employer actions which may be perceived by employees as disloyal and which may reduce employees' loyalty to the organization. Organizations could also assess their levels of loyalty as employers and take action to raise these levels. For more general purposes, a code of conduct for employers can serve as a professional

guide to the forms of loyalty that all employers could identify with, while perhaps giving specified guidelines for what would constitute best practice within each industry.

## Introduction

Incidences of industrial unrest continue to exist across the world (e.g., China Wal-Mart strike in 2016) and are a reflection of still-existing hostile relationships between employers and employees, which are harmful to the interests of all parties involved. People and the relationships between them and the employer for whom they work are, and always have been, however, a crucial aspect for organizations' competitiveness, and the main goal of any employment relationship strategy is to improve these relationships in the workplace. In this regard, given that managers at all hierarchical levels frequently interact with employees, their daily behavior and leadership may be pivotal in guiding the relationships between employer and employees in a good direction in which all the parties involved become highly benefited by giving their best.

Employment relationships are defined as the efforts made in an organization to efficiently manage the relationships between employer and employees. In other words, employment relationships are understood as exchanges arising from the behaviors of both employees and employers (Tsui and Wu 2005), between the inducements offered by employers and the expected contributions of the employees. These relationships may not be successful for all the parties in all cases, yet the objective of any employer is to seek employment relationships in which all parties are satisfied and give their best in a sustainable, long-term manner (Tsui and Wu 2005). To this end, shaping employees' positive perceptions of these relationships is critical, and the fair treatment, care, respect, ethical behavior, setting of ethical standards, and transparent decision-making of managers in any organization (i.e., the practice of ethical leadership, Brown et al. 2005) may help in this endeavor. Ethical leadership refers to “the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making” (Brown et al. 2005: 121). The practice of such leadership imply that individuals live as moral persons

(i.e., holding strong moral principles and traits and performing ethical behaviors) as well as act as moral managers, exhibiting visible behaviors (e.g., communicating ethics, Brown et al. 2005) with which to make employees act responsibly and protect the rights and needs of all parties involved in their interactions with others. It is of no surprise then that, by engaging in ethical leadership, managers encourage employees to “go above and beyond” in order to help the manager and their organization” (Brown et al. 2005). As such, encouraging ethical leadership at all managerial levels may be a successful strategy to improve or elevate employment relationships in organizations.

### Employment Relationships: Nature and Typology

Management scholars have studied employment relationships for many decades. This interest is based on the need to understand the behavior of employees in organizations as responses to the perceptions of the exchange relationships that occur between the employer (the organization or its representatives) and the employees themselves. Positive, valuable behaviors and attitudes (job involvement, likelihood of staying, low absenteeism, and productivity or job effectiveness) are expected to be displayed by employees in organizations where such relationships are perceived as good. Hence, there is a growing interest in studying these relationships and particularly the factors that can help make them a competitive advantage for organizations.

To analyze employment relationships in organizations, Tsui et al. (1997) proposed a model (Table 1) in which they combined an organization’s “offered inducements” and “expected employee contributions.” Tsui et al. (1997) defined “offered inducements” as the economic and developmental rewards that employers offer to induce employees to contribute to the organization. “Expected contributions” are, instead, defined as employers’ expectations of employees contributing to the organization with previously designated and desirable behaviors, goals, and

**Source:** Based on Tsui et al. (1997) and Tsui and Wu (2005)

attitudes (e.g., performance, new organizational improvement ideas, and commitment).

When the “offered inducements” coincide with “expected employees’ behaviors,” employment relationships are balanced, which means that both actors (employees and employers) agree on the provision of services and on the compensation offered and received, with both employer and employee coexisting in balance with one another. There are two balanced employment relationships: “**Quasi-Spot Contract**” and “**Mutual Investment**,” each having contrasting implications, as described below.

Balanced “**Quasi-Spot Contract**” relationships represent pure economic exchanges, where the organization adopts an “economic-utilitarian” approach in the design, implementation, and development of its HR (human resources) management system. In these relationships, the organization offers a narrow set of inducements, such as poor remuneration systems, little job security, and few social benefits. In return, employees are expected to offer a minimal return, largely characterized by low bonding and low commitment. This relationship therefore has a clearly short-term orientation, as none of the parties expects inducements or contributions beyond those specified. “**Mutual Investment**” employment relationships, meanwhile, endure in the long term. In these relationships, the high level of investments made by the organization is compensated for by the high level of “expected employee contributions.” In this case, employers consider their employees as a source of competitive advantage and offer them attractive incentives (e.g., high

salaries, job security, and social benefits) while expecting in return a high level of contributions, i.e., the provision of broad open-ended obligations and of high performance and commitment to their organization's mission.

As Table 1 shows, in addition to the aforementioned "balanced" employer-employee relationships, two unbalanced employment relationships can also emerge. These are termed "**Overinvestment**" and "**Underinvestment**," such that when either of these situations occur, there is said to be no balance between the organizational offer of inducements and the expected employee contributions.

"**Overinvestment**" is, for example, characterized by the organization offering its employees manifold valuable incentives that are likely greater than the contributions employees are expected to offer. The employer, based on their trust in the employee's future expected contributions, offers open-ended and broad-ranging rewards, including training and strong commitments to provide the employees with career opportunities. However, the employee performs (or is expected to perform) only a well-specified set of job-focused activities. In this scenario, the organization is ahead of the results and assumes certain risks, given the high investments in its employees' development. Some civil service jobs or jobs protected by a union contract may fall under this approach. On the other hand, "**Underinvestment**" relationships are characterized by the imbalance between the low investment made by the employer in the human aspect and the high demands the organization makes of its employees. The "inducements" offered to employees are poor (e.g., precarious work conditions, low salaries, lack of incentives, and no investment in training or professional career), yet the organization expects much more from employees than what it offers. Employees are likely to accept this minimum level of inducements provided they have no better employment options. However, potential consequences of such a situation include high turnover and absenteeism, and labor conflict. This relationship is unbalanced and unsustainable (Tsui and Wu 2005).

The fundamental contribution of Tsui et al.'s (1997) employment relationships perspective to HR management is that it identifies the critical processes that link HR management practices to organizational outcomes. Tsui et al.'s (1997) model of employment relationships is a broader HR management conceptualization than the model of high-performance work systems (HPWS). The former includes not only the appropriate variety of practices and procedures an organization can implement to achieve employment relationships which they can make the most of (e.g., employee engagement and employee motivation) but also expectations about potential employee contributions to the organization (Tsui and Wu 2005). Under this model, the typical recommendations offered are that a "fit" between "offered inducements" and "expected contributions" can generate better results for organizations. Thus, workers from whom the employer expects high contributions must be managed through "**Mutual Investment**" employment models and workers from whom the employer expects low contributions must be managed through transactional HR management practices to produce their expected short-term, specified outcomes (Quasi-Spot contract). Furthermore, these recommendations also include the short-term oriented "**Underinvestment**" and "**Overinvestment**" employment relationships models being corrected and transformed into balanced situations (Tsui et al. 1997). However, the target of achieving a similar or superior situation to that produced by a "**Mutual Investment**" approach should be set (Tsui and Wu 2005), for which ethical leadership at all managerial levels is likely to help.

Indeed, Tsui et al.'s (1997) model analyzes employment relationships in organizations from the employer's perspective. This widely recognized model explains these relationships through the lens of the employer, who seeks to maximize the benefits of these relationships according to the specific HR management strategy that is (or will be) implemented. However, given the high level of daily interactions between managers at hierarchical levels and with their employees, their leadership style in day-to-day dynamics is likely to

play a role in “how” these relationships are perceived by employees. Through ethical leadership, managers may be key in bolstering employment relationships with a strong ethical component, where people are considered as ends in themselves and not just as means to an end, thus steering all possibilities of employment relationships toward their maximum level. By building high-quality social exchanges with and between the employees (social exchange theory, SET, Blau 1964), by leading employees to learn the right behavior to perform (social learning theory, SLT, Bandura 1977), by providing employees with abundant resources (e.g., support, caring behavior, integrity, honest communication, and safety net) or the perception that their current set of resources will not be lost, but rather expanded (conservation of resources theory, COR, Hobfoll et al. 2008), and by aligning employees’ identity to that of the organization (social identity theory, SIT, Tajfel and Turner 1986), managers’ ethical leadership can leverage and boost employees’ efforts toward achieving organizational objectives.

**Ethical Leadership: How Does It Elevate Employment Relationships?**

Scholars have widely demonstrated the positive outcomes of ethical leadership at individual (e.g., extra effort, willingness to report problems to management, job involvement, organizational commitment, job satisfaction, and affective well-being, Brown et al. 2005; Den Hartog 2015) and unit/team level (e.g., team performance, team citizenship behavior, low team deviance behavior, and low relationship conflict; Den Hartog 2015). A number of theories (SET, Blau 1964; SLT, Bandura 1977; COR, Hobfoll et al. 2008; and SIT, Tajfel and Turner 1986) provide theoretical explanations for this. SET, for example, argues that due to the care, support, and fair treatment provided by an (ethical) leader, employees feel an obligation to reciprocate with positive outcomes directed toward either that leader or other more general targets (i.e., team, unit, and organization) (cf., Blau 1964). SLT argues that employees are

attracted to their leaders and may see their ethical leaders as role models of correct behavior in the workplace, such that this guide for good behavior (consistent with ethical standards and the practice of virtues, e.g., being fair, having the best interest of others in mind, and serving the common good; see Table 2) should lead employees to flourish as humans, and therefore excel in the workplace (Aristotle 2004, 1098a). Meanwhile, according to COR, an ethical leader can be conceptualized to be a source of resources, such that any fear employees may have of losing their current resources is likely reduced (cf., Hobfoll et al. 2018). Furthermore, under an ethical leader, employees may feel they gain abundant resources (e.g., support, honesty, caring behavior, fair and transparent treatment, and safety net), which should compensate for any other drawbacks and help them to obtain other valuable resources and feel less stress and greater affective well-being (cf., Hobfoll et al. 2018). Finally, SIT argues that individuals identify with organizations evoking positive values (Tajfel and Turner 1986). Consequently, since ethical leaders work to instill ethical values in their teams, employees may see positive characteristics in these teams, likely leading them to identify and feel oneness with their teams, thus

**Source:** Adapted from Treviño et al. (2003) and Brown et al. (2005)

being intrinsically motivated to do their best for the collective good of the organization (cf., Tajfel and Turner 1986).

Ethical leadership can therefore inspire employees in the need to do their best for the leader, the team to which they belong, and/or their organization. This brings an interesting nuance to the understanding of Tsui et al.'s (1997) employment relationships model. Their four types of employment relationships are based on the employer view, yet the day-to-day leadership of the managers of the organization, including that of the employer, could make a difference in what can be achieved in any of these four relationships, regardless of whether they are balanced or unbalanced. Indeed, while “**Mutual Investment**” employment relationships involve mutual, long-term, sustainable benefits for employers and employees, the other types of employment relations can also be transformed into beneficial relations for both employers and employees, especially if all managers within the organization practice ethical leadership. Table 2, which describes the characteristics of ethical leadership, can help appreciate the key role of managerial ethical leadership in qualifying the possibilities of Tsui et al.'s (2005) four employment relationships model.

In line with previous research, ethical leaders present a series of positive characteristics (Table 2), such that they may lead employees to change their perceptions of the inducements they perceive as being provided by their organization, and even, of the efforts they should make for their leader, team, unit, or organization. Indeed, the presence of an ethical leader who is a principled performer, enforces ethical standards, is caring and fair, and serves the common good (Table 2) is a factor that can lead employees to perceive multiple positive inducements and can lead them to contribute more than expected. These leaders will motivate the employees to do their best for them, the team, and, as a result, the organization in which they work.

Thus, the possibility of a “**Quasi-Spot Contract**” employment relationship appearing in an organization is lower when managers practice

ethical leadership, as employees are unlikely to view their contract with their organization as a pure economic exchange. Rather, they will see it as a social exchange or as a relationship through which they gain resources, feel oneness with their team or organization, or perform behaviors that are “the right thing to do.” An “**Underinvestment**” employment relationship is also unlikely to appear, as employees will probably not perceive their organization is offering low-quality inducements, rather they will perceive they are receiving more than expected (e.g., multiple resources, social exchange, and social identity), which should lead them to reciprocate with positive outcomes. Additionally, an “**Overinvestment**” employment relationship in which the employees are only expected to perform a reduced set of job activities – despite the multiple positive inducements offered by the organization – is unlikely to emerge under the supervision of an ethical leader. Because these leaders embody a purpose that is compelling and morally rich (one of serving society and the common good) and inspiring (Table 2), employees’ endeavors are likely to be aligned with fulfilling the organizational objectives and mission in a way that exceeds expectations. Finally, ethical leadership will further enhance the positive outcomes expected for both employees and the employer in a “**Mutual Investment**” employment relationship situation. This is in line with Aristotelian thinking that suggests the provision of moral goods in any relationship is what most matters to make it sustainable (Aristotle 2004, 1156b), such that it can lead the parties involved (employer and employees) to pursue the greatest good for each other.

Overall, the inclusion of managerial ethical leadership in the equation can influence Tsui et al.'s (2005) model of employment relations. By promoting a culture of respect (i.e., treating employees as ends in themselves), trust, honesty, and support in the team, managers engaging in ethical leadership at all levels in an organization is likely to positively shape employee perceptions of employment relationships and build such relationships to maximize employee contributions and ensure collective benefits for both the employer and employees.

## Conclusion

Employment relationships and ethical leadership intersect when these relationships produce that all the parties involved can flourish as humans. On the one hand, the practice of ethical leadership by managers affects the inducements (or the perception of the inducements) offered by the organization. Thus, by practicing ethical leadership, managers may transmit that the company clearly offers plentiful positive inducements. Importantly, they may also show that the organization is seeking respect for employees' dignity, even when the offer of inducements, for technical and organizational reasons, is precarious (as may happen in cases of **"Quasi-Spot Contract"** and **"Underinvestment"** relationships), which should positively shape employees' perception of the inducements offered by the organization. On the other hand, ethical leadership should affect the expected contributions of employees, driving their endeavors to the highest level. By displaying the moral manager dimension, ethical leaders are expected to provide moral goods, as well as promote ethical behavior and communicate the importance they attach to ethics and to meeting stakeholders' needs (humanity's needs). This should help employees perceive the broader purpose of their daily work, one that likely induces workers to flourish as humans and thus provide, in return, the highest performance and commitment possible to their teams, units, or organizations. Overall, then, as it was reasoned in this encyclopedia entry, ethical leadership may make a significant difference in making employment relationships as beneficial as possible to both parties (employers and employees).

## Enron Scandal

## Definition

At the end of the twentieth century, Enron was an admired and often praised energy supply and trading conglomerate based in Houston, United States of America. The subsequent scandal at Enron was a scandal of toxic leadership and fraud involving the systematic and prolonged portrayal of a healthy financial picture at the corporation which

was completely unrelated to the reality of its actual trading and profitability status (Boddy 2015).

Enron went bankrupt in the first year of this century (2001) as the largest bankruptcy and auditing failure in United States history at the time, involving over \$63 billion in corporate assets. The fraud also caused the destruction of Enron's auditors, a (top 5) global accountancy firm (Arthur Andersen), as other clients lost confidence in them. Enron had reportedly bullied and pressured the auditors at Arthur Anderson to ignore financial reporting issues. During the legal investigations into the scandal, Arthur Anderson was found guilty of illegally destroying documents relevant to the investigation of Enron and it lost its license to audit, its reputation, and its customers and went out of business.

The Enron scandal entailed toxic leadership, fraud, grandiose lying, personal greed, and a lack of concern by the agents involved, over the consequences of their actions on the employees, shareholders, or any other stakeholders of the corporation.

## Description

Enron is an attention-grabbing example in business ethics studies as it has been described as being a perfect example of an unethical (Culpan and Trussel 2005) and systemically psychopathic business. Lauded by Fortune magazine, among others, as one of the most innovative and admired corporations in America (Van Niel and Rapoport 2004), Enron was a very large United States energy corporation, and it was ranked about fifth biggest in the Fortune 500 list by the year 2000.

Various investigators have presented explanations for why Enron went bankrupt. However, many of these explanations are mechanistic in nature. They answer the question of how events unfolded rather than why, and do not address the behavioral root causes of the events which underpin the technicalities of the failure. Enron may well have failed because it booked profits up to 20 years ahead of when those profits could reasonably be expected to be realized, or because it

was very much in debt and too short term in orientation or was fraudulent or persuasive in presenting a false illusion of financial accomplishment. However, personal attributes like avarice, ruthlessness, and an unethical approach to business underpinned Enron's approach to management. There was reported to be a huge amount of personal greed involved in the Enron fraud.

Enron went bankrupt in December 2001 after losing money for years and finally declaring losses of \$1.2b in an off-balance sheet equity fund. Enron is linked to unethical behavior, toxic leadership, and corporate psychopathy for many reasons, one of which is that Fastow, the Chief Financial Officer at Enron, was described as displaying several of the traits of the corporate psychopath. These included setting up fraudulent entities with which to make deals with Enron in order to keep various financial liabilities off the official company books, thus displaying untruthfulness and a cheating personality.

Corresponding with the theory that corporate psychopaths create chaos and confusion in their immediate environment so as to hide their true intentions from view, Enron fashioned a web of special purpose financial entities whose transactions were not appropriately reflected in the balance sheet. This made for a lack of transparency in the accounts and represented a structure that was "an extraordinarily complex piece of financial engineering." Further, many of Enron's transactions appeared to be designed to enable the manufacture of flattering financial statements rather than to describe authentic business transactions. For example, Enron created a complicated web of over 700 related companies and deals to hide the true extent of their debt. These dealings allowed Enron to obscure market losses and mislead analysts. It has been noted that this obfuscation via organizational complexity may be a common characteristic of corporate psychopaths.

Enron and its leaders demonstrated several of the traits of toxic leaders, for example, they were narcissistic in that they overtly sought praise and admiration and referred to themselves as the world's greatest corporation, even though this was largely pretense. Enron was also Machiavellian as an organization as it manipulated events at

the expense of others to further its own interests. Corporate psychopathy was also evident as Enron and its leaders lied without conscience, remorse, or regret and at the expense of others to gain personal wealth and power. The culture within Enron was ruthless and intra-personally competitive and, for example, 15–20% of the “worst performing” employees were dismissed every year, creating a vicious culture of brutal in-fighting (Van Niel and Rapoport 2004). This led to a cruel, immoral, and venomous corporate culture where employees attacked one another rather than supporting each other. Theoretically corporate psychopaths, like other toxic leaders, use divide and conquer tactics such as this to divert attention away from their self-serving activities which may include fraud. An anxious, in-fighting workforce is easier to dominate and manipulate and less likely to speak out against malpractice.

Corporate psychopaths employ close control of their environment, and Enron was also marked by enforced conformity and the penalizing of dissent (Tourish and Vatcha 2005). Meanwhile, Enron’s manipulation of the United States energy markets led to large reported profits for that part of the business, while clients for that electricity paid unprecedented amounts for it. Further, customers such as schools, businesses, and households suffered from power disruptions and complete blackouts (Clarke 2005). This demonstrates ruthlessness and a lack of care for others such as customers, at Enron; these are among the characteristics of psychopathy. Enron was further characterized by its selfish and rude culture, and the leadership can be described as toxic because the tone at the top of Enron was reportedly one of ruthlessness, arrogance, bullying, stage management, and lying; further, it was one where unethical practices were encouraged and rewarded (Tonge et al. 2003). Enron was also reportedly well known for bullying those analysts who disagreed with its own optimistic estimation of Enron’s prospects. Objectors and whistle-blowers were persecuted or forced out of their positions and, in the face of this mistreatment, very few internal or external accountants, auditors, or analysts raised any suspicions concerning

Enron’s inflated revenues. Internal whistle-blowers were reportedly demoted or transferred to other posts. Subordinates cannot often do very much to defend themselves against bad managers, and an examination of Enron appears to confirm this because whistle-blowers were easily reassigned and silenced.

Enron was manipulative and untrustworthy, creating illusory revenues and profits. Ken Lay (the Chief Executive Officer) similarly encouraged employees to believe that the stock price was buoyant while simultaneously selling (2001) millions of dollars of his own shares in Enron. Lay had also previously cashed in \$123.4 m in stock options in 2000. The scale of deception at Enron was so great and so stage managed that it fooled investment analysts for years. Lay repeatedly hosted Wall Street analysts to the sixth floor of the Headquarter building where a fake trading floor of energy services dealers was set up. Computer screens were connected to receive bogus data, dealers talked to each other in teleconference rooms and by telephone, making pretend deals whereas no real business was conducted (Boje et al. 2007). Analysts were both hoodwinked and impressed despite the fact that Enron’s lack of financial clarity was well known on Wall Street.

Of the top managers at Enron, Ken Lay, Jeff Skilling, and Andy Fastow, all three have been mentioned as candidates for psychopathy. Enron’s Skilling was described by Frank Perri in 2013 as possessing the traits of a corporate psychopath being manipulative, glib, lying, bullying, egocentric, and lacking in remorse. Fastow has also been described as displaying many of the traits of a corporate psychopath. Correspondingly, Enron’s tone at the top was depicted by inside managers as being one where acceptable practices included lying and deception as long as money was being made, and top executives were reported to be aggressive and greedy. Further, when Lay was confronted with one executive who questioned the reality of Enron’s financial statements, that executive was replaced. This applied to external critics as well and an external auditor who questioned whether Enron’s business was

supported by sound financial performance was removed from the audit team.

Thus, Enron as a corporation arguably displayed all the signs of being a toxic and psychopathic entity while its Chief Executive Officer, Lay, also displayed many of the same signs himself. That Enron ran a regular employee dismissal scheme demonstrates a callous and cold indifference to the fate of others; again this is a characteristic of corporate psychopaths. It also demonstrates ruthlessness, as does Lay's misleading of investors in claiming that Enron was fundamentally strong when Lay and the Chief Financial Officer were aware that financial cataclysm was approaching. The example of Enron illustrates how toxic, irresponsible leadership can bring down the largest of corporations as well as one of their multinational partners. This case also illustrates the devastating destructiveness of toxic leaders.

## Introduction

Environmental accounting is a broad term which covers both national- and corporate-level environmental performance activities and associated stakeholder interactions. It includes the processing of both financial and nonfinancial information regarding environmental and ecological impacts. At a corporate level, environmental accounting can be defined as a set of organizational activities that deal with the measurement and analysis of the environmental performance of corporations and the reporting of such results to concerned groups, both within and outside the corporation. At a national or regional level, environmental accounting is that branch of accounting dealing with activities, methods, recordings, analysis, and reporting of environmental and ecological impacts of defined economic systems.

The exact scope of environmental accounting remains contested, however, and definitions and applications vary; environmental accounts usually

include a mix of financial and nonfinancial terms and can be prepared for internal and/or external use. Nevertheless, two major subsets of environmental accounting can be identified: environmental management accounting (EMA) and environmental reporting.

### **Environmental Management Accounting (EMA)**

*Environmental management accounting (EMA)* is a comprehensive approach to management accounting aimed at assisting internal organizational calculations and decision making regarding environmental matters. EMA includes recording and analysis of both the physical processes for material and energy consumption, flows and final disposal (including release of emissions), and the monetized procedures for costs and benefits related to activities with potential environmental and ecological impact. At the corporate level, EMA typically focuses on the cost and associated control structure of environmental and ecological impacts of a company. At a national level, EMA (which can be used for both internal and external purposes) records the flows of raw materials (such as water, energy, minerals, and fossil fuels) from the environment to the economy while also recording shadow prices for these materials and environment protection expenditures. EMA is, however, a flexible approach, and there are substantial differences in the scope or boundary of its application.

### **Environmental Reporting**

Environmental reporting deals with the disclosure of environmentally related information by an organization. This can include (but is not limited to) contingent environmental liabilities/risks, asset revaluations and capital projections as they relate to the environment, cost analysis in key areas (such as energy, waste, and environmental protection), investment appraisal to

include environmental and climate change factors, carbon emission and related control measures, ecological impacts, levels of support for community environmental projects, and levels of emission reduction support (such as the Clean Development Mechanism) for developing countries.

The disclosure of environmental information can be viewed as part of an organization's responsibility to its stakeholders and/or a response to stakeholder expectations. Environmental reporting, at both national and corporate levels, is a voluntary activity, and organizations make use of a diverse range of reporting media. These include annual reports, stand-alone sustainability reports, integrated reports, special purpose reports, websites, and social media to communicate environmental information to the wider community.

### **Motivation for Environmental Accounting**

Both positivist and normative approaches have been suggested to explain the underlying motivations for environmental accounting. Positivist approaches include agency theory and political cost theory, legitimacy theory, stakeholder theory, and institutional theory. Normative approaches primarily include accountability theory and critical theory. Each approach offers particular systematic assumptions, preconceptions, and insights, and each has its limitations and critics.

Agency theory and political cost theory suggest that organizations take environmental actions in order to maximize managerial and shareholder interests, and these theories rely upon the economic-based assumption that all action is driven by individual self-interest (tied to wealth maximization). According to legitimacy theory, stakeholder theory, and institutional theory, however, environmental accounting is a tool used to respond to stakeholder and community expectations and maintain legitimacy. Unlike agency and political cost theory, stakeholder,

institutional, and legitimacy theory do not rely on the central assumption that all action must be driven by individual self-interest.

The normative theories (accountability and critical theory) typically reject market-related solutions, consider all stakeholders to be morally deserving, and argue that one stakeholder group (such as shareholders) should not benefit at the expense of other stakeholders (such as the community or employees). Accountability theory, in particular, suggests that an organization has a duty to provide an account of the actions for which it is held responsible, with critical theory suggesting that organizational actions should play a pivotal role in reducing social inequality and injustice. While there are different branches of accountability theories and critical theories, they are helpful in understanding the critical basis of environmental accounting. The Gaia hypothesis, for example, posits that the effect of an organization's activities upon externalities is the organization's concern and hence a proper concern for accounting; organizations are accordingly accountable for any environmental and ecological impacts on the society in which they operate. As a critical theory, it thus represents a radical departure from economic-based assumptions (that underlie agency theory for instance).

Both accountability theory and critical theory are significant in regarding environmental accounting practices as a moral discourse to satisfy a larger range of accountability relationships. However, as these theories seek to prescribe how accounting should be practiced (or perhaps, should not be practiced), empirical support is limited.

## Introduction

Environmental assessment (EA) is a planning tool used to systematically consider the potentially serious environmental and social effects of projects, programs, or policies on societal values in order to inform decision-making. In some jurisdictions, project-specific EA is legally required for major land and resource developments and results in a “go” or “no go” decision with final decisions resting with the highest order of governments. A substantial part of EA involves the public, interest groups, local governments, Indigenous peoples, and provincial and federal government agencies

weighing evidence and information in order to defend alternative preferred futures.

The most commonly applied EAs today are those required by legislation to assess large or complex development projects and inform decisions on whether or not such a project will proceed. There is no similarly strict legislative requirement for governments to consider environmental and social effects of other kinds of decisions. Instead, strategic assessments designed to consider government policies, programs, or plans are adopted on a much more informal basis and lacks systematic approaches and methods. Regional cumulative effects assessments are also increasingly being used in some jurisdictions to consider regional scale and longer-term effects of multiple developments. These kinds of assessments are discussed in the section at the end of this entry, but the focus of this entry is on project-level EAs and is organized into four sections that outline (a) the EA process, (b) the emergence of EA, (c) common criticisms, and (d) new approaches.

## The EA Process

Project EAs tend to apply to large or complex projects that meet or exceed particular characteristics. For example, a new hydroelectric generating station with production capacity of 200 MW or more requires a federal EA in Canada. Due to this clear legal requirement, EAs are one of the most frequently used processes to make decisions about development. In Canada and other jurisdictions with Indigenous populations, this legal requirement also makes EA one of the most frequently used mechanisms for governments to address their legal duty towards Indigenous peoples. Internationally, this duty is best defined in the *United Nations Declaration for the Rights of Indigenous Peoples* and the principle of free, prior, and informed consent. Public participation is also a central element of the process and is used more or less depending on factors such as level of public concern about a proposed development.

In general, the project-level EA process begins when a developer proposes to build, expand, or decommission an extractive, industrial, or infrastructure project. While every EA is different due to jurisdictional requirements, level of concern, type of development, among other reasons, the process is composed of a set of steps that are typical of most EAs. These steps are:

- Proponent provides description of proposed project components to initiate the process.
- Detailed process and information requirements are defined.
- An assessment of individual effects of the project is completed on specified valued ecological and socioeconomic components and their understanding of significance of each effect.
- Gaps in information are identified and additional information and analyses may be requested before accepting the assessment application.
- All parties deliberate on adequacy of information and present new information to include in the assessment until regulator determines that there is enough information to make a decision.
- Regulators consider all information provided by the proponent and other parties and present their understanding of significance of each effect with justification, which includes a set of measures that the proponent and regulators must commit to, with recommendations to decision-makers (e.g., federal Minister of Environment).
- A decision is issued with reasons, where a “go” decision may require additional information, monitoring, and compliance measures, and a “no go” decision results in the process ending.

All of these steps involve Indigenous governments and the public to greater or lesser degrees, with requirements for engagement oftentimes defined in policy and law. For example, Canada’s laws requires that consultation with Indigenous groups take place in order to identify seriousness of impact on constitutionally protected Aboriginal rights so that any infringements on these rights can be identified and accommodated. The scope of the assessment can either be

narrow or broad, depending on several factors, including the level of engagement and concern raised by interested parties, the depth of information and analysis in the assessment of each effect, the temporal boundaries of assessment to include historical change over time, and the comprehensiveness of the selected valued components (VCs). VCs are defined as the aspects of environment, society, economy, culture, or heritage that are valued by the government, Indigenous peoples, scientists, or the public likely to be affected by the proposed development.

EAs are also coordinated in various ways, depending on project complexity and jurisdiction. In Canada, the federal government may appoint a three-member, independent panel to coordinate and assess large and complex projects, like mines, for example, and make recommendations to cabinet. EAs in the provinces of British Columbia, on the other hand, tend to rely on government staff to coordinate the process and make recommendations to their responsible Minister(s).

Every EA, though, requires multiple government agencies to cooperate on addressing interdependent environmental, social, cultural, and economic issues that arise from large developments. This kind of integration and whole project kind of decision makes EAs distinct from single-agency, permit-based environmental decisions, and allow for broad objectives like sustainability and reconciliation to be considered. There are few processes that legally require interagency and interjurisdictional cooperation and engagement to discuss mutual issues and concerns in relation to development across landscapes, including with Indigenous governments. There are also few process available to discuss development of the public. Despite the intention of integration and engagement, however, decisions often come down to weighing the importance of localized negative effects to national policy imperatives. For example, when significant adverse effects are identified, the decision maker must consider if these effects are justified in the circumstances. Policy imperatives like economic development and job creation may overshadow

uncertain effects expected to occur on a local population of salmon, for example. Despite these limitations, however, EA remains an important tool for influencing development outcomes by creating rare public opportunities for deliberating over preferred futures.

## Emergence of EA

Before EA was introduced, resources were managed with little to no consideration of ecological and social values. Forestry and fishing, for example, were extracted at a rate of maximum sustained yield to, theoretically permit future use, and non-renewable resource deposits like oil and minerals that were continuously being discovered. Unlike holistic Indigenous approaches that managed resources in a way that considered the interconnections of social and ecological factors across a territory, western resource managers more narrowly focused on rates of extracting a single resource sector at a time. Environmental and community costs were deemed to be externalities to the primarily economic goals of development. As industrial mechanization and other methods led to increased rates of extraction, however, the public became increasingly concerned over environmental and social impacts of development. In the 1960s and 1970s, governments established departments related to environmental protection and introduced the first environmental assessment laws.

The first EA laws passed in the United States in 1969. Canada established the *Environmental Assessment Review Process* in 1973, but the Province of Ontario, the James Bay Cree, and Inuit of Northern Quebec first formalized EA law in Canada in 1975. The Cree and Inuit through the James Bay and Northern Quebec Agreement was the first of several modern treaties with Canada that establish comanaged EAs. While the federal government did not introduce EA legislation until the 1990s, the federal Mackenzie Valley Pipeline Inquiry led by Justice Thomas Berger is often referenced as a good example EA. The Inquiry

took place between 1974 and 1977 and was broadly scoped to include strong Indigenous engagement, regional considerations such as cumulative social and cultural effects, a broadly defined pipeline corridor concept rather than a specific pipeline proposal, as well as strong consideration of accidents. The EA resulted in policy-level recommendations to government asking that outstanding land claims be settled before development proceeds.

## Common Criticisms

Since EA was first introduced, it has been subject to immense criticism from industry proponents, environmental groups, Indigenous peoples, and scholars alike. Common criticisms include:

- Unpredictable process and timelines, creating uncertainty for all parties involved.
- Central concerns like sustainability, ecosystem stewardship, and cumulative effects are avoided despite the stated purposes of EA to include these concerns.
- Cumulative effects are done poorly, with assessments focused on contribution of a project to a cumulative effect without serious consideration of ecological thresholds that may already be exceeded or, for Indigenous communities, historical activities that have already seriously eroded a culture and way of life.
- Expert judgment tends to be relied upon without adequate scrutiny and verification of these judgments.
- Developer is responsible for compiling the evidence and, in turn, process is heavily biased towards their interests.
- Process relies upon lawyers and creates an overly bureaucratic process that is intimidating for public to participate.
- Regulators and proponents lack of experience in integrating Indigenous traditional knowledge, especially when it may conflict with scientific information.
- Funding and time is too limited in the EA, placing pressure on communities and governments experiencing capacity constraints.
- Social impacts are often overlooked in favor of economic benefits, especially social impacts to vulnerable populations.
- Once EAs are complete, very little is done to follow-up and verify effect predictions or monitor seriousness that could be used to improve EA practice.

These problems with EA have been discussed at length in the literature and responses have emerged in theory and in practice, such as socio-economic impact assessment that is now a common part of many EAs. More recent approaches responding to EA criticism are described below.

## New Approaches

**Streamlining EA:** The most common changes to EA practice have involved streamlining that aims to make EA more efficient and predictable for government and for developers. Mechanisms for improving speed of EAs include introduced timelines, narrowly scoped EAs, and reduced time for public participation. Streamlining also involves centralizing decisions, so decisions rest with (a) less dispersed authorities, (b) higher orders of government, and (c) reduces influence of public and other parties in the process. This approach runs contrary to other emerging approaches that often require more time, integration across governments and agencies, and public deliberation.

**Strategic environmental assessment:** This approach is not new but is often identified as a tool that has potential to improve upon several of the deficiencies of project EAs. Strategic environmental assessment is a systematic approach for considering environmental effects of plans, policies, and programs. The European Union adopted a directive that aims to introduce the process as it pertains to plans and programs that affect land use. However, the institutional or methodological

foundations of the approach are not well understood and rarely implemented systematically.

**Regional cumulative effects assessment:** As industry sectors experience fast-paced growth, intensive development in one region may place strain on regional ecosystems and human communities. Typical project-specific EAs may include cumulative effects assessment as one consideration, but regional cumulative effects assessment functions to consider regional environmental change and stressors on valued components using scenarios, trends, and defining desirable futures in light of historic, ongoing, and future development pressures, as well as more strategic considerations like policies and programs. These assessments share many similarities with strategic environmental assessment.

**Collaboration and consent models:** As Indigenous rights are increasingly gaining recognition in decisions over development, Indigenous governments are pushing for collaborative EAs and implementation of the principles of the *United Nations Declaration of the Rights of Indigenous Peoples*, including free, prior, and informed consent. Where rights are a central consideration, new methods for cultural impact assessment, Indigenous rights assessments, and assessments on traditional use practices are being developed and adopted by Indigenous communities that allow for development of novel management and regulatory regimes, including development of unique mitigations and follow-up measures negotiated through impact management benefit agreements.

## Conclusion

EA is nearly 50 years old and has emerged today as one of the more important tools used by many governments to ensure environmental and other considerations are included in decisions about development. EA remains a central decision tool for development across the landscape in many parts of the world. A wide variety of issues can be considered in any EA, from culture and Indigenous rights to ecological and economic issues. Unlike strategic assessments designed to consider

government policies, programs, or plans, project-level assessments are often legally required for major projects. Strategic and regional cumulative environmental assessments, however, have an important role to play when governments choose whether or not to adopt specific policies and programs.

While EA practice is well-established, the process remains subject to important and longstanding criticism. Effects on vulnerable populations, Indigenous traditional knowledge, and cumulative effects tend to be assessed and considered poorly in most EAs. Practitioners continue to test new approaches to address these problems both in theory and practice with some success. Like all decisions that aim to manage development, however, governments and populations are often divided over priorities such as job creation and environmental conservation. Practitioners and citizens alike deserve a rigorous and transparent EA process to ensure government accountability when EAs are used to rationalize these difficult choices.

## Environmental Change in the Arctic

### Introduction

The intersection between ethics and politics in the Arctic region has become an important issue under international discussion. One main topic to which this relates is environmental change and the sustainability of the Arctic region which is linked to the use and exploitation of natural resources. This raises questions about how we should define environmental ethics, environmental change and sustainability as a general principle for the Arctic region, as well as how we define the problem in relation to participating stakeholders. With the ongoing climate crisis and damage to the environment, new possibilities and dilemmas have emerged. Many countries seek to benefit from the natural resources of the region and there is an ongoing debate about who has legitimate rights there. Accordingly, we need to discuss the future of environmental ethics and sustainability as a general principle as well as ethical challenges for the Arctic region. What are the different ethical issues that are at stake? Who owns the Arctic? (Schönfeldt 2017).

Ethical challenges for the Arctic region include issues related to interventions by technology and natural science in order to preserve human and environmental sustainability (Hough 2013). Given our Anthropocene age, the protection of human beings and flora and fauna within the context of nature and the geological landscape is critical. This is particularly challenging given the rapid rate of environmental change in the Arctic and ongoing economic concerns which put

pressure on this region (Johnstone 2015). The issues involved are complex. Political and economic issues are critical. What is considered “good politics” of the region as opposed to “power politics”? What is the most appropriate way of dealing with natural resources in this area (Powell and Dodds 2014)? What is the moral responsibility of corporations doing business here? Legal issues are an important part of the debate as discussed in the “Yearbook of Polar Law” which is a major reference work in this field (Alfredsson 2008–2016). One challenge has been how international law protects the Arctic region (Schönfeldt 2017). Further challenges are posed by considering sociocultural factors relating to the peoples living here.

### Case Study: Uranium Mining in Greenland

In terms of ethical theory, we can address this as a problem of the relationship between business, society, and the state (Rendtorff 2018). One case study highlighting this relates to the recent debate in Denmark regarding uranium mining in Greenland. This case is pertinent as it links to the important issues of social responsibility and environmental ethics currently faced in the Arctic region. Greenland has been self-governed since 2009 following the 2008 Self-Government Act and referendum, and there is an official policy in place with Denmark regarding environmental and social sustainability. According to this Act, Greenland has full authority over its natural resources. As environmental change in the Arctic accelerates the melting of the ice, Greenland’s natural resources including uranium, iron ore, lead, oil, and diamonds are becoming more accessible. Greenland has identified resource extraction as a means of becoming economically self-sufficient but this has posed significant challenges for the young government which has sought international assistance in developing this. In particular, the issue of uranium mining has proved contentious for relations between Greenland and Denmark. Denmark is decreasing its reliance on nuclear energy and is still responsible for international safeguards agreements on the export of

uranium. Denmark has done little towards fulfilling its responsibilities in this regard despite their legal agreement with Greenland to do so. Despite the fact that Greenland does have rights over its natural resources including uranium, it relies on Denmark for issues relating to security and foreign policy. Due to its use in nuclear energy and technology and the demand for this worldwide, uranium is, therefore, an issue requiring the active participation of both Greenland and Denmark. This equal engagement has not always occurred. For example, although Greenland has decided to adhere to the Treaty on the Non-Proliferation of Nuclear Weapons in 2004, Denmark has done little to ensure that the issue of uranium mining in Greenland is submitted to the relevant international conventions.

### The Concept of Responsibility

The case of Greenland and uranium mining can be used as an example of the changing conditions posed by ethics, law, and responsibility in the Arctic in this global age. In his 1979 book “The Imperative of Responsibility,” Jonas focuses on the social and ethical problems caused by technology and defends a global and metaphysical concept of responsibility. He poses the argument that technological and scientific development implies a need for the increased responsibility for humanity and the environment more than at any other point in history. The responsibility of humanity is made that much greater due to the ability of humankind to destroy the world. Jonas proposes a new understanding of bioethics and the ethics of science in relation to technological civilization to ensure the survival of the human species. Jonas’ rallying cry was “Act in this way that there will always be human life on earth” (Jonas, p. 15). The concepts expressed in his work implied expanding the concept of responsibility that embraces the future of the biosphere in its totality. This concept of responsibility may have beneficial applications in international politics particularly relating to the implementation of sustainable development.

The concept of “sustainable development” was outlined by the 1987 Brundtland Commission as

the fundamental aim of the international community (World Commission on the Environment 1987). It is defined as “meeting the needs of current generations without compromising the ability of those in the future to meet their own needs.” Elkington (1997) expanded on this with his introduction of “the triple bottom-line” in which a corporation or organization focuses on profits and gains as well as on environmental impacts, social relations of its employees, the relationship between the corporation and the local community, and other related factors. In this context, it is the general intention of the concept of sustainable development to integrate the social, economic, and environmental concerns within an overall policy of responsibility for sustainable development in the world. This can provide the basis for discussions about governance in the Arctic (Byers 2009, 2013; Molenaar et al. 2013; Rothwell and Stephens 2016; Nord 2016).

The debate about the social responsibility of the corporation is highly relevant given the potential impact on Arctic businesses caused by environmental change. It moves beyond the responsibility of the individual and the community to include the institutional responsibility of a corporation (Rendtorff 2009, 2018). Thus, the corporation is a political and moral actor that must respond to its duty as a good citizen with respect for its duties to the community and world at large. In “Valueshift” (2002), Paine contends that there is a change of values in the modern capitalist economy when we no longer consider the corporation solely as an instrument for profit maximization but as a responsible moral actor with values and ethical principles. Carroll’s work on ethics and the responsibility of the corporation distinguishes between economic, legal, ethical, and philanthropic responsibilities (Carroll 1979). In this context, it is possible to distinguish between the institutional responsibility of the corporation, the responsibility of the corporation’s directors and managers, and that of the employees. The concept of the responsibility goes further than a specific legal responsibility and includes a large number of obligations that are ethically defined in relation to the stakeholders of the corporation.

Thus, the shift in the definition of the concept of responsibility relates to the emergence of collective and institutional accountability. It is a collective responsibility that can and should be taken by groups or by individuals in common and is of tremendous importance in the Arctic region given the changing economic, political, social, and environmental landscape (Ricoeur 1990). With this collective dimension, we have found the link between individual and institutional responsibility with regard to the common good of present and future generations.

## Introduction

Environmental conflict<sup>1</sup> emerges directly over differential access to (and control over) natural resources, or differential exposure to environmental degradation. Natural resources are commonly understood as biological and geo-chemical inputs

<sup>1</sup>As opposed to the environmental damage wrought by military conflict.

into economic production – including renewable resources (water, soil, timber, plants, and animals) and nonrenewable or finite resources (Earth minerals and metal ores, fossil fuels, groundwater in aquifers). However, a broader conceptualization of natural resources would include ecosystem services – the elegant functioning of still intact ecosystems to sequester carbon, cycle nutrients, decompose waste, pollinate plants, and stabilize climate, while providing myriad other ecological, cultural, spiritual, and recreational benefits. Environmental degradation implies either resource depletion (deforestation, mineral extraction, species extinction) or loss of ecosystem integrity or quality (habitat fragmentation, air and water pollution).

Environmental conflict can be considered a wicked problem – complex and intractable wherein resolution (or even mitigation) requires coordination among diverse actors working with competing interests (Crowley and Head 2017). Therefore, the ethics of environmental conflict can be understood broadly as the power-laden negotiation of socio-natural values that come into question when competing development paradigms and Nature ontologies interact.

This entry identifies the biophysical and discursive construct within which this discussion (and its ethical considerations) must be situated – the Anthropocene. It then situates environmental conflict within a key conceptual frame – critical political ecology – identifying competing development paradigms as a primary site of encounter. Such struggle often pits proponents of extractive resource development against citizens of place-based communities (including Indigenous peoples), with crucial implications for deliberative democracy and local self-determination. This entry concludes with ways to mitigate environmental conflict, understood across scale, from local to global.

## Backdrop

### The Anthropocene

Sources of any specific environmental conflict remain highly contextual, but a set of broad environmental, socio-economic, and geopolitical factors provide a common backdrop. There is

growing recognition that we have entered (or are entering) a new geological epoch – materially and discursively framed as the Anthropocene – involving “human impacts on the Earth’s surface of such magnitude, scope and scale as to present an existential threat” (Castree 2014, 437). Environmentally, we face imminent global challenges of humanity’s own making (climate change, biodiversity collapse, ocean acidification, burgeoning global population, among others) that may well determine our evolutionary “fitness” as a species, and thus, our ability to survive.

Such environmental challenges disproportionately impact Indigenous, poor, and racialized populations across the globe. Therefore, attention to power dynamics at multiple scales is imperative to the ethics of environmental conflict. Consider that geologists parallel the beginning of the Anthropocene era with the European Industrial Revolution. The transition from subsistence economies to large-scale factory production and wage labor gave rise to a Western consumer society, fueled by the extraction of natural and human resources from periphery nations to feed the industrial core. Today, the colonized peoples and places that were exploited to fuel the expansion of economic globalization bear the brunt of climate change and environmental degradation brought on by centuries of natural resource extraction. Specific formations of capitalism and colonialism evolved in particular places (at particular times) to result in the uneven development of global production and consumption. The positive and negative social and environmental impacts of globalization are unevenly dispersed across space and time, experienced differently by various peoples and places. This uneven distribution of goods and bads privileges core, industrialized nations and disadvantages poorer, developing countries internationally, and privileges core urban centers and disadvantages rural or remote peripheries intranationally.

The political backdrop to the Anthropocene is greatly impacted by the historical and ongoing uneven development of the global political economy, which has resulted in a highly variable democratic index among countries around the world. Even in “full” democracies, the globalization of capitalism and epistemic blinders of neoliberal

ideology often result in government-industry collusion, lack of deliberative democratic process, and the undermining of civil society. Each of these exacerbating factors has deeply ethical implications for interrogating environmental conflict.

### **Environmental Ethics**

Ethics involves moral philosophical reasoning to determine what constitutes right conduct – a fundamentally axiological (values-based) discussion. Environmental ethics pivot on considerations of not only how value is determined, but also how it is applied. In other words, what do we consider to be valuable in Nature, why, who gets to decide, and to what effect? Do nonhuman species have intrinsic rights? Do ecosystems? Do future generations? If they do, how should those rights be reconciled with the human right to self-determination through development or exploitation of natural resources?

Environmental ethics forces us to confront the notion that our individual and collective actions impact one another, future generations, nonhuman species, and ecosystem health writ large across various geographic and temporal scales. Such ethical considerations have implications for justice and equity and demand a normative discussion of how we ought to live to reduce deleterious impacts that result in environmental conflict. As a concrete and acute example of environmental injustice, consider the disproportionate impact of anthropogenic climate change on less developed nations (from Mozambique and Malawi to low-lying island nations in the Pacific) (Kreft et al. 2017) that contributed only negligibly to its causes.

## **Conceptual Frame**

### **Critical Political Ecology**

Critical political ecology offers a flexible conceptual framework for ethical analysis of environmental conflict. The lens originates from scholarly attempts to integrate questions of Nature with political-economic relations. It is commonly understood as the merger of cultural ecology and political economy.

Critical political ecology involves a multi-scalar analysis, attentive to how regional and

global power relations impact ways in which the natural world is perceived, utilized, produced, and represented by humans in diverse historical, geographical, and ideological contexts. Situated within poststructuralism, this mode of theorizing maintains that Nature is always constructed – always mediated through social, cultural, political, and economic relations. For instance, Nature may be constituted materially, as a natural resource for commodification and regulation, or symbolically, as a cultural representation to produce meaning and collective understanding in diverse societies.

Therefore, an analysis of how power operates remains central to critical political ecology: notably, theorists uncover how power is circulated and harnessed to produce different Natures and how hegemonic discourses of Nature are invoked by a privileged set of actors, while counter-hegemonic discourses are silenced and dismissed. In this way, critical political ecology is a normative lens, for it contends that the uneven distribution of environmental goods and bads, environmental change, and ecological conditions are the product of political-economic processes that disproportionately impact marginalized peoples and places.

### **Nature as Ontological Terrain of Contestation**

Often, Westerners privilege Eurocentric understandings of Nature as separate from (and implicitly inferior to) humans – solely resources to be exploited for human advancement and recreation. However, scholars of postcolonialism, Latin American modernity/coloniality/decoloniality, and science and technology studies uncover pluralist conceptualizations of Nature that recognize a multiplicity of human relationships to the natural world.

For instance, the Inuit of the Arctic Circle practice a cosmology that includes humans in a balance with the natural and spiritual worlds – a balance severely disrupted by climate change. Similarly, in Peru, the Quechua people practice an “Andean shamanism” that respects sacred mountains, or “Earth Beings,” as sentient participants in local culture. Both examples provide extreme contrasts to the principles of exploitative

capitalism and the human activities that have birthed the Anthropocene.

Therefore, given that environmental ethics are questions of what in Nature is considered valuable and how that value is applied, environmental conflict occurs in the contention of competing philosophies about humankind's position contra Nature. Preempted by Indigenous knowledge and critique, Nature can be understood as a landscape of struggle upon which power is mediated and negotiated. In other words, competing ontologies of Nature underpin conflicts over access to, control over, and development of, natural resources, and challenge a priori assumptions over what constitutes a commodifiable "natural resource" in the first place. The contestation of Nature ontologies is imminently power-laden and political, cultural, and defensible. However, affinities and solidarities might also arise in the negotiation of meanings and interactions with Nature, formulating unique responses and alternative reactions to political-ecological conditions.

## Sites of Encounter

### Competing Development Paradigms

As mentioned above, environmental conflict often results from competing development paradigms – evident in place-based struggles between local peoples affected by environmental degradation and corporate players seeking to extract (or exploit) resources. Competing actors vie for state favor in decision-making to either: (1) (re)inforce socio-environmental regulations and protections to limit the scope and impact of harmful externalities potentially caused by resource development or (2) facilitate a regulatory regime conducive to corporate development of state environmental assets. In this way, mitigation of environmental conflict serves as a test of deliberative democratic values or, democracy in action.

Counter-hegemonic actors involved in place-based environmental struggles not only contest modernist constructions of Nature, but also highlight environmental (in)justice, including: the disproportionate impact of environmental degradation on racialized peoples; the absence of policies and

processes that enable the participation of marginalized communities in public decision-making; and the institutional and cultural (mis)recognition of communities of difference through the (mis)recognition of particular places and identities. Proponents seeking to shed light on the racialized burden of environmental impacts emerged in the Western world in the early 1980s as the environmental justice<sup>2</sup> movement. However, subsistence communities across the globe have long resisted the privatization of common assets, acutely aware of deleterious localized (and intergenerational) socio-environmental consequences.

Environmental justice advocates highlight instances of environmental racism and injustice, such as the siting of nuclear waste dumps and hazardous waste landfills near Native American reserves and African American communities in the United States, or the damming and rerouting of waterways that Indigenous livelihoods depend upon, so that hydroelectricity can fuel distant urban centers. With the environment defined broadly as the place where people work, play, live, and worship, institutional racism, such as the underfunding and lack of regulation of on-reserve water treatment facilities in First Nations across Canada, is also considered an issue of environmental injustice.

Contemporary examples of place-based conflict over what constitutes desirable development or acceptable environmental harm abound. For instance, in the United States, Native American opposition to the Dakota Access Pipeline (vis-à-vis a 2017 protest near Standing Rock Indian Reservation in North Dakota) garnered international attention. In Canada, Alberta's (and the federal government's) support for expansion of the Kinder Morgan Trans Mountain pipeline is actively contested. British Columbia presses for more stringent environmental regulations around spill response, restitution to communities in the

<sup>2</sup>The U.S. Environmental Protection Agency (2017) defines environmental justice as: "... the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies."

event of a spill, greater appreciation for the costs of remediation, and so on, while multiple Indigenous communities (including both coastal communities and those living in close proximity to the proposed pipeline) oppose the project.

### Place-Based Environmental Conflict

Place-based subsistence societies are more likely to feel the environmental impacts of extractive resource development and climate change than those living in cities and industrialized nations. Living off the land and local markets of exchange between neighbors for daily sustenance necessarily requires an intimate understanding of the natural world (when to expect rain, when to rotate crops, how to hunt and harvest to maintain balance with animal, fish, or plant reproduction, etc.). Because of this intimate connection between human survival and the well-being of the natural world, such subsistence requires balance with Nature as well as an understanding of humans as *one part of* Nature that must behave/relate harmoniously within the living ecosystem. Place-based ontologies see humans as a part of the natural world, rather than separate from it.

### Ways to Mitigate Conflict

Given the persistence and prevalence of environmental conflict, the ethical imperative remains to mitigate it. To this end, responses to environmental conflict can be understood across scale: from local to regional, state/provincial, national, and international. Individual responses might include critical, iterative, and self-reflexive evaluation of how lifestyle choices impact others (broadly interpreted) across space and time, to reduce current and future conflict. (Have I unwittingly consumed palm oil in packaged food products that contributes to rainforest deforestation and human rights abuses? Have I unwittingly purchased a “blood diamond” mined in Africa by forced labor, with proceeds funding armed rebels?).

However, an individual’s socio-economic position and geographic location necessarily impacts their ability to make consumption choices

based upon a privileged notion of right and wrong – a person living in sub-Saharan Africa cannot be expected to carry the same responsibility for making “greener,” more “ethical” consumption choices as a Westerner living in an urbanized society. The same considerations apply to the ethics of responsibility related to the human dimensions of climate change. Should countries that emit the least greenhouse gas emissions, yet bear the brunt of environmental impacts, be expected to cover the costs of mitigation/adaptation on their own? Should developing nations be limited in their energy use now when Western countries industrialized through extraction of resources from peripheral nations, where environmental impacts are now concentrated? The complex ethics of global climate change and questions of state roles, responsibilities, and compensation are central issues in the international negotiation of climate change agreements.

At the community level, environmental conflict can be mitigated through co-governance of natural resources. Environmental co-governance usually involves state actors sharing power over decision-making with community members and/or community-based organizations (with structural mechanisms to ensure transparency and accountability). Such a model supports local populations in their pursuit of self-determination – to have a meaningful say in decision-making over “development” of the land on which they live and make their livelihoods. More and more, in the era of economic globalization and cultural imperialism, this denotes a struggle over culture, and as such, environmental conflicts have been characterized as “cultural mobilizations” or contestations of Nature ontologies, as referred to above.

Environmental conflict often necessitates public consultations that tend to be dominated by corporate lobbyists representing powerful industrial interests (and fraught with government-industry collusion). Thus, ecological citizenship can be either promoted or constrained by the state. Moving along the continuum towards greater inclusivity of marginalized social actors, representing a broader range of interests from

civil society, and mitigating power differentials ensures at the very least a more robust and deliberative democracy. Principles of representation, transparency, public awareness, social justice, bias, accountability, and logistics must come into play when engaging citizens through public consultation. Adkin similarly advocates for: "... citizen participation in decision-making processes (planning, approval, monitoring, priority setting), transparency in these processes, resources for citizens' groups to 'level the playing field' in conflicts involving well-funded corporations, independent regulatory agencies, more funding for 'independent' scientific research, compensation for environmental harms, government and corporate accountability and responsibility, stricter regulation of corporate activities, community autonomy and self-determination" (Adkin 2009, 298). Only by embracing deliberative democratic principles can the state redress its own collusion with industry such that consultation and decision-making stands up to ethical scrutiny.

Many advocating for state-based solutions invoke the precautionary principle: when there exists a preponderance of evidence pointing to potential harm, policy makers ought to err on the side of caution. Current predictive capacity points to serious potential harm(s) of, for instance: a warmer and less stable climate; the global distribution of persistent organic pollutants; ocean acidification; loss of biodiversity; disruptions to freshwater, nitrogen, and phosphorus cycles; and so on. All of these biophysical stressors are precursors to conflict, and thus the ethical response would be to take preemptive action to avoid or mitigate them. In practical terms, state actions that advance a greener economy could mitigate environmental conflict (though they would inevitably be met with significant resistance from those benefiting from the status quo). However, the ethical way to divest from fossil fuels and extractive industries would involve supports for livelihood transitions – to move beyond the tiresome and unproductive lose-lose scenario when jobs are pitted against the environment.

In an international context, implementation of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) would affirm,

advance, and protect the human rights of Indigenous peoples – demanding comprehensive and transformative changes to state institutional and justice frameworks. Doing so would fundamentally challenge the current neoliberal, political-economic reality and directly impact Indigenous self-determination, thus mitigating environmental conflict. However, the UNDRIP is more likely to be adopted as an "aspirational" document.

And finally, local environmental conflict is now subject to extra-state involvement. In 2016, the International Criminal Court (backed by the United Nations) expanded its remit to include the prosecution of governments and individuals for deliberate environmental destruction, illegal exploitation of natural resources, and land grabbing.

Ultimately, our ability to mitigate environmental conflict will determine the long-term integrity of local and global ecosystems, the health of human and nonhuman species, and equitable and sustainable access to (and control over) natural resources.

## Environmental Ethics and Sustainability

### Definition

Since the World Commission on Environment and Development – also known as the Brundtland Report – first coined the concept of sustainable development in 1987, the meaning of the term has evolved considerably. However, there is general consensus that sustainability involves the reconciliation of ecological, social, and economic imperatives (Dale 2001; Robinson and Tinker 1997). Without equal access to these three imperatives, sustainability will not be realized (Dale 2001). From the beginning, the social imperative has been the least understood and routinely drops out when economic imperatives dominate (Dale and Newman 2008; Mayo and Ellis 2009; Moore 2007; Mueller and Dooling 2011; Saha and Paterson 2008; Sarmiento and Sims 2015; Szibbo 2016).

## The Social Imperative and Equity Issues

With respect to sustainability writ large, the social imperative implicates considerable equity issues, including a time dimension, that is, decisions taken now that are unsustainable “lock-in” development paths for future generations and foreclose the options of future generations. Although the Brundtland Report identified extreme inequality in resource distribution as the “main environmental problem” (World Commission on Environment and Development 1987, p. 6), claiming that “a world in which poverty and inequality are endemic will always be prone to ecological and other crises” (1987, p. 43), maldistribution of resources has continued to rise. Further, Piketty (2017) explains in depth that inequity is far worse now than 30 years ago when the Brundtland Report was published.

Equity issues have been variously referred to as environmental ethics, social justice, and, more recently, spatial justice, which introduces place into the “social” (Soja 2008). People and human communities have differential access to resources simply by virtue of the place they were born and either an abundance or paucity of natural resources. Spatial justice, therefore, brings new meaning to the privileges and advantages of class, race, and gender and how these modifiers have been dispersed according to geographic locations (Soja 2008). A further rationale for the existence of spatial justice is because “seeking to increase justice or to decrease justice is a fundamental objective in all societies, a foundational principle for sustaining human dignity and fairness” (Soja 2008).

A further argument for the integration of place into social justice is the reality that modern-day issues, such as climate change and biodiversity loss, are interconnected and dependent upon global-scale solutions. Climate change impacts are simultaneously local, regional, national, and international, with differential impacts on communities. For example, small island states are more vulnerable to sea level rise than inland communities, due to their small geographical area, isolation, and exposure. The failure to address these differential impacts and inequities results in even greater global turbulence. Further, 60%

of humanity live in coastal areas, and therefore, both developing and developed communities share vulnerability to climate change and sea level rise. Low-lying coastal areas in all countries are threatened, including agriculturally productive river deltas worldwide (Slade, COP 1, 1995).

## Sustainability and Generational Equity

In addition to inequities in access to natural resources as a function of place, there are now gross inequities that are generational. According to the Credit Suisse Research Institute's global wealth report, global wealth rose by 6.4% in the 12 months to June 2017, and the ranks of the rich expanded again, with 2.3 million new millionaires added to the total, and the top 1% own more than half of all global wealth. With respect to millennials, Americans currently aged between 30 and 39 years are calculated to have amassed 46% less wealth on average in 2017 than the equivalent cohort had gathered in 2007 (The Economist 2017).

And there are global impacts that do not take into account health effects in addition to spatial justice. In 1994, Mexico signed a free trade agreement with the United States and Canada, which triggered an insidious rise of obesity and malnutrition. Mexico became a tariff-free dumping ground for soft drinks and junk food imported from the United States. Almost a quarter of a century later, Mexico has the world's second highest obesity rate and growing child malnutrition crisis (Whitlow Delano and Summers 2018). This is but one example of the inequitable distributable effects of ignoring the critical intersection of social and spatial justice and its impacts on health outcomes. Both are essential to the realization of sustainable community development worldwide.

## Conclusion

Sustainability for some and not all clearly is not working with the rising threats from terrorism, the increase in the number of environmental refugees (Dale and Newman 2008). In addition, increasing places of "haves" and "have nots," social

exclusivity (Haase et al. 2017), homogenizing concentration of social problems in one place, and augmenting income disparities create a perfect storm for feeding the rising populism of the last decade. Only when social and spatial justice are integrated, recognizing that basic human needs must be met at the same time as the inequitable distribution and accessibility to ecological, social, and economic resources have to be addressed, will a lasting world peace be achieved and the full potential of human civilization reached.

### Introduction

Environmental philosophy (Western) encompasses a large area of study that is focused on examining the relationship between humans and nature, including differing positions on the ultimate value of the environment. Some claim nature is intrinsically or noninstrumentally valuable, while others believe it to be instrumentally valuable in terms of its various uses and resources that allow for humans to exist and flourish (Kaufman 2003; Pojman and Pojman 2012). In general, those that endorse a view of nature as possessing intrinsic value of some form are referred to as environmentalists or conservationists, while those who favor the view of nature as

instrumentally valuable can be referred to as industrializers (Newton 2005). Views on the value of nature exist on a continuum with preservationist perspectives on the environment as intrinsically valuable sitting on one end, and the perspective of the environment as purely instrumental, profitable, and exploitable on the other.

## Environmental Philosophy

### Positions on the Value of the Environment

A key distinction in the field of Western environmental philosophy and ethics is between the anthropocentric valuing of nature, which is human-centered and sees the environment as for the benefit of humans, and the ecocentric valuing of nature, which is valuing nature for its own sake. Anthropocentric views of nature are thought to have evolved from Judeo-Christian beliefs about human superiority and dominion bestowed by God over the rest of nature including animals and natural resources. These beliefs of human superiority were then fed into scientific and materialist worldviews that harnessed the power of science and technology to further exert control over the environment and its resources (Kaufman 2003; Pojman and Pojman 2012; Schmidtz and Willott 2012). Not all anthropocentric approaches to environmental value posit unrestricted exploitation of nature; some believe that natural resources can be managed carefully in order to preserve them for future generations, as seen in the concepts of sustainable development and sustainable resource management (Pojman and Pojman 2012). Others claim that all values are anthropocentric, and that all valuing exists only in virtue of the existence of valuers themselves, which are all human. Anthropocentric views of nature generally value nature instrumentally in terms of the benefits its resources bring for humans and their interests, and this often comes at the expense of other species of plants and animals.

Nonanthropocentric views of the environment focus on varying levels or aspects of the environment or the environment as a whole as possessing intrinsic or noninstrumental value. As such, the extent to which the moral community ought to be

enlarged from human beings becomes central in determining toward whom and to what extent we owe direct moral consideration or obligations. Nonhuman animals, for example, possess sentience, which means they have feelings and cognitive similarities to humans in such a way as to seem logical to extend the moral community to include at least other mammals (Thomas 2016). Biocentric thinkers believe that individual living things, whether animal or plant, are deserving of respect and that we should question the belief that humans are superior to other living things (Kaufman 2003). This view is also sometimes referred to as “life-centered” and can focus on the larger concept of the biocentric whole (biocentric holism), or on individuals (biocentric individualism) as the locus of intrinsic value. Questions concerning what it means to be living versus nonliving in addition to disagreements or potential conflicts between valuing wholes versus individuals can be characteristic of these views (Kaufman 2003).

Ecocentric views of the environment place moral value centrally on ecosystems of various kinds, despite debates regarding how to clearly identify what counts as an ecosystem and how to determine its value in relation to the individuals that inhabit it (Kaufman 2003; Pojman and Pojman 2012; Schmidtz and Willott 2012; Zimmerman et al. 2005). On this view, harming an ecosystem would be wrong not because of the individual plants and animals that will be harmed, but because the particular ecosystem itself will be harmed. Rather than viewing ecosystems as being alive themselves, as biocentric philosophers would claim, ecocentric philosophers believe they have their own moral standing as systems. Ethical considerations regarding the treatment of ecosystems would involve the preservation of the integrity of the ecosystem as a whole and how human actions, like hunting a particular species within that ecosystem to extinction, might affect the ecosystem’s ability to thrive. Humans are seen as members of these moral communities rather than as dominators or conquerors of them (Kaufman 2003).

Deep ecologists also view nature as being intrinsically valuable, and they distinguish

themselves from “shallow” ecologists who focus on technical solutions to environmental problems without requiring the more fundamental and deeper shifts in beliefs and worldviews. Deep ecologists come from more diverse intellectual backgrounds than other environmental philosophers, and so it is more challenging to provide any one definition or description to encompass the perspective as a whole. Broadly speaking, the view promotes a “deep” connection with and understanding of ourselves as inseparable from nature in such a way as to discourage harm toward it out of a sense of harming an extension of ourselves (Kaufman 2003; Schmidtz and Willott 2012).

Ecofeminism posits connections between the domination of nature and the oppression of women and espouses the view that environmental ethics will ultimately fail to properly address environmental issues without acknowledging and addressing this relationship. This view is explicitly against all forms of oppression and as such also focuses on the intersecting forms of oppression, such as racism and speciesism. For some ecofeminists, employing a care ethics approach to the environment allows for greater consideration of the specific relationships that exist between humans, other animals and living things, and systems as guides to our moral obligations (Kaufman 2003; Pojman and Pojman 2012).

Regardless of whether or not one endorses an anthropocentric or nonanthropocentric view of nature, we are faced with environmental issues today of great urgency to the continued existence of humans and other species. The application of these philosophical perspectives to these issues means that other disciplines will need to evaluate their underlying beliefs and values to better understand how to direct their policies and behaviors.

## Environmental Philosophy and Business

### Environmental Issues Involving Businesses and Industries

Businesses can be the cause of a number of environmental issues, but can also be invaluable in providing expertise, special knowledge, and

resources that can deal with them, and in creating new solutions for preventing further environmental damages. Despite debate about whether the bulk of the ethical responsibility for environmental issues lies with the consumer, companies and other businesses, or the government, businesses can certainly create, reduce, and increase or decrease environmental harms. From an environmentalist's perspective, using earth's resources as purely instrumentally valuable for creating profit can lead to the types of issues we are currently faced with, including emissions that lead to climate change and global warming; pollution of seas, oceans, lakes, and rivers; air pollution; destruction of habitats for wild species (both plant and animal) for development or manufacturing; destruction and pollution of soil through intensive farming practices and factory farming of animals; natural resource extraction; and more (Belshaw 2001). Other issues involve the use of animals as products or as labor and include causing pain to sentient beings through related business practices such as farming, experimentation, entertainment, and tourism (Zsolnai 2011). Multinational enterprises in particular take advantage of lower environmental standards in developing countries and "pollution havens," often leading not only to environmental issues, but to issues regarding the health and safety of local workers and communities and also to concerns about perpetuating the harmful "race to the bottom" that can occur within international business practices (Kolk 2016).

Environmentalist critiques of industries and business practices point to the monetization of nature and its resources and the reduction of the environmental to its instrumentally valuable goods and services (Newton 2005). For example, in performing a cost-benefit analysis, placing a monetary value on all costs and benefits allows for comparisons to be made. Unfortunately, using such methods can tend to almost always benefit the company performing the analysis, and many environmentalists believe that given the level of scientific uncertainty inherent in environmental science and related fields, many costs remain unknown. In such cases, it would clearly be in

the benefit of any given company to ignore preventative measures for environmental protection in order to obtain shorter-term benefits (Newton 2005). Despite cost-benefit analyses being a common method for companies and industries to evaluate their actions in relation to environmental issues or concerns, many environmentalists would argue that this method leads to environmental damages that can't always be measured monetarily, especially if one believes nature has intrinsic value (Kaufman 2003; Schmidt and Willott 2012).

## Environmental Philosophy and Business Ethics

There are a few ways that businesses and industries might approach environmental issues. Broadly speaking, some believe that market-based solutions are the most effective means of environmental regulation, whereby the market can effectively meet the preferences of consumers to live in a healthy environment. The assumption is that consumers are willing to pay higher costs for greater environmental protections. However, many have criticized this market-based approach because it fails to consider other sorts of preferences (like animals), that consumers don't always act freely and rationally, and that the assumption that the willingness to pay for something is an accurate way to measure its value may be false (Belshaw 2001; Kaufman 2003; Zimmerman et al. 2005). Environmentalists would argue that if nature has intrinsic value, including the value of sentient creatures and living units like ecosystems, then the market-based approach to addressing environmental issues is flawed from the start.

Corporate social responsibility (CSR) is another approach to including environmental issues into a business's responsibilities to its stakeholders, which may include the natural environment or other elements of it (Schuler et al. 2017). Meeting the desires of environmental stakeholders, as well as potentially viewing nature as a stakeholder, can mean that CSR is used as a means for increasing profit while maintaining the view that nature is only valuable instrumentally.

“Green” initiatives or policies that can be included as part of a company’s CSR activities can lead to greater competitiveness by increasing its market power. While it’s possible that CSR can include social justice issues and ways to more directly address environmental issues (as some smaller companies may do out of a genuine desire to protect nature), generally speaking, environmental issues are addressed only when profitable and advantageous to the firm (Schuler et al. 2017). So, although some companies may view nature as intrinsically valuable and thereby consider it, or part of it, directly in their CSR policies, for the most part nature is still considered instrumentally valuable on this view.

Finally, the concept of sustainable development and sustainability policies has been implemented by some businesses in the attempt to address environmental issues related to business actions and behaviors. Sustainable development, as a concept, was developed as the idea that any development should meet the needs of people today without compromising the needs of people in the future, and it has been applied in numerous areas including natural resource management policies (Pojman and Pojman 2012; Schuler et al. 2017). Most often, sustainability is understood as a means for meeting human preferences, and so is characterized as a view that holds nature as instrumentally valuable, and not as intrinsically valuable. Much work has been done to consider how companies might incorporate sustainability policies into their practices. However, many environmentalists are critical of these attempts, highlighting problems such as the tendency to adopt a utilitarian perspective that neglects the idea of nature having interests (as it isn’t sentient) and for failing to address the fundamental problem of consumption in developed nations, which underlies the immense drive to exploit natural resources at a pace that simply can never be sustainable (Pojman and Pojman 2012; Schuler et al. 2017; Zsolnai 2011). While some companies may value the environment noninstrumentally, it remains a challenge to combine the pursuit of profit with practices that improve, or at least are neutral, to the overall health of our environment.

## Summary

There are a variety of views on the value of nature and on the human–environment relationship within environmental philosophy. Many of these adopt a perspective of nature that possesses intrinsic value that is irreducible to its uses for humans. Conversely, businesses are often faced with the pressure of creating and implementing environmental policies that promote sustainability and that meet the desires of their stakeholders, including environmentalists who hold the natural environment and nonhuman animals to have intrinsic value, from a view that nature is valuable instrumentally. Some would argue that businesses simply can’t adopt a view of nature that is biocentric or ecocentric as it is simply not pragmatic, and that one will always commit some sort of environmental harm regardless of sustainability goals (Rosenthal and Buchholz 1998). The urgency of issues such as climate change may just be the impetus needed for a genuine reevaluation of environmental values held and endorsed by businesses, which can be usefully implemented into policies and actions.

## Equality of Opportunity

Fair and Open competition; Fair merit-based adjudication

### Introduction

Equality of opportunity is usually a concept applied to the public domain in liberal democracies and capitalist countries. The assumption is that merit-based evaluations of people are fair and morally acceptable as long as all positions within a competition are open to all and decisions about who is selected for the opportunity at hand is based on who is most qualified to fill the opportunity. Fairness, in turn, is based on bona fide qualifications, sometimes referred to as talents. Consistent with this articulation of the principle is the understanding that it is limited in scope. As Strauss (1992) states, “equality of opportunity requires the elimination of barriers to advancement that are in some sense arbitrary.” Further, he states, “This conception sees equality of opportunity as a meritocratic principle that allows,

roughly speaking, the free operation of the market.” It is precisely this conceptualization that critics finding unsatisfactory morally and a misnomer as a descriptor.

There have been many versions of equality of opportunity, including utilitarian arguments and deontological arguments. In his arguments about access to education for women, Mill argues that education is good to increase overall utility, including education to increase people’s understanding of higher order judgments about happiness and satisfaction. And if women are educated then open competitions should result in the best candidates getting the jobs whether those are women or men.

The basic disagreement is between those who believe that equality of opportunity is a just way to evaluate the outcome of competing for a position, whatever that position might be which is in the public domain, and those who believe that justice requires equality of outcome or equality of results rather than just equality of opportunity. The argument against equality of opportunity charges that there are many social and economic determinants which serve as barriers to effective and actualized equality of opportunity.

### Example of An Equality of Opportunity Case

Universities are good examples of institutions that are in the public domain but somewhat meritocratic in terms of bona fide conditions for admission. Many universities, for example, have standards that must be met for acceptance and entrance into university programs of study by students. Universities publicize deadlines for admission and publicly list all of the necessary conditions that must be met to be acceptable for entrance. Due to equality concerns and challenges based on systemic discrimination claims, these requirements have been broadened in past decades. These include pathways for admission such as graduation from high school with a certain grade point average and often include graduation from standard arts and science courses or alternative evidence that one meets the standards through

different means, such as, community college courses and/or portfolios of equivalent work experience. So, no one has a right to attend university but people have a right to be fairly evaluated based on relevant grounds and a right not to be discriminated against based on irrelevant grounds, such as, sex or gender, sexual identification, race, or ethnicity. But they can be discriminated against based on access standards which operate as a meritocratic basis for admission and be denied access based on inadequate educational preparation, such as lack of necessary levels of literacy, numeracy, or basic understanding of the entrance requirements such as preparatory courses in Biology or Chemistry or Calculus. Further, some traditional and it could be claimed more elite institutions set cut off criteria that still fit the classic standard of fair equality of opportunity, such as, high cut off grades like graduation with 85–90% points from high school. While this discriminates against a number of students below that grade, it is seen as meeting the equality of opportunity criteria if such a standard is made public and all students who satisfy that entrance requirement are treated in a procedurally fair and similar fashion. Many programs of study where the numbers of students admitted are capped by limitations in, for example, clinical placements often start with a lower threshold for students but then admit by criteria, which include grade point averages. So a Nursing Program may say that students are eligible to apply to the program with the minimum of a B average but if they have a cut off of, for example, 250 students a year they may fill the 250 placements by beginning with the highest grade point average and meet their quota without admitting any students with lower than a grade point average.

### Criticisms of Equality of Opportunity Using this Example

Critics argue that equality of opportunity is not fair or just because you cannot equalize everyone's starting position in competitions for opportunities that are open and where success is based on what used to be called "talents." The critiques

basically argue that equality of opportunity does not result in equality of outcomes and this is where traditional liberals and theories which argue for interventions and compensations diverge. For example, Arneson (1999) argues that equality of opportunity allows for inequalities imposed by socialization, among other variables. So, in our university example, women may have been brought up to believe that higher education is not for women so are excluded from competing by their socialized "stunted ambition." Further, many researchers (Mettler 2014) have noted that data confirm that even if the competition for entrance into university including students from different economic backgrounds has been broadened to make university more accessible, the outcome of that access is not equitable. As Mettler notes,

...degree attainment among upper income households so dramatically outpaces that of low-and middle income that the percentage who obtain diplomas is greater than the other three quadrants [of income] combined.

### Rawls' Fair Equality of Opportunity Principle (FEO)

While there are many articulations of equality of opportunity principles, Rawls' attention to this principle has been a source of focus since the latter part of the twentieth century. In its revised iteration, Rawls (1999) states that the following will be henceforth referred to as "the liberal principle of fair equality of opportunity." Part of the challenge of presenting Rawls' theory is that he stated that it was inextricably related to his difference principle which consequently will be briefly presented here. As well, he argued that the assumption of his theory is that education was open and accessible for all.

Rawls states of his FEO that

...positions are to be not only open in a formal sense, but that all should have a fair chance to attain them. ...[and] that those with similar abilities and skills should have similar life chances. More specifically, assuming that there is a distribution of natural assets, those who are at the same level of talent and ability and have the same willingness to use them, should have the same prospects of success regardless of their initial place in the social system. In all sectors of society there should be roughly equal prospects of culture and achievement

for everyone similarly motivated and endowed. The expectations of those with the same abilities and aspirations should not be affected by their social class.

Rawls' Difference Principle assumes that some people are better situated than others and compensates for that imbalance as follows:

Assuming the framework of institutions required by equal liberty and fair equality of opportunity, the higher expectations of those better situated are just if and only if they work as part of a scheme which improves the expectations of the least advantaged members of society.

While there are many critics and defenders of Rawls' theory, the fundamental issues seem to precede Rawls' version of FEO and its precursors. On the one hand, there are arguments and empirical evidence which claim to illustrate that prejudice exists and mitigates against objective assessment in the exercise of operationalizing the employers' interpretation of the same level of "talent and ability". Further, although Rawls acknowledges that family and early circumstances can work against some people, he still thinks that education can serve to equalize one's chance. Critics argue that data such as Mettler's noted in this article proves the resilience of circumstances of birth, sex, sexual orientation, race, ethnicity, and poverty in significantly determining one's future social and economic status in liberal democracies and capitalist countries.

## Ethical Analysis of Tax Avoidance

## Introduction

Corporate tax avoidance is generally used as an umbrella term to refer to all tax minimization practices which stay within the legal boundaries. Being characterized as legal, tax avoidance is distinguished from *tax evasion*, which refers to illegal actions to reduce tax liabilities, typically entailing deception and concealment. In the last decade, the practice of tax avoidance has been subject to intense public and political attention. The media, NGOs, and the general public recurrently scrutinize and "name and shame" companies not only for their illegal tax practices but also when they consider such practices as unfair, outrageous, and/or immoral.

Some major lines of argumentations clearly explain why tax avoidance has become a relevant issue for the business ethics debate, above and beyond the purely legal sphere. First, the nature and functions of corporate tax payments are intrinsically ethical: they correspond to a moral duty of good citizenship; they serve to fund the provision of public goods and services; and they help to reduce the unequal distribution of income

and wealth in society. Second, tax avoidance is widely diffused among MNEs all over the world with a huge impact on our societies: the OECD estimates that these practices collectively cost governments \$100–240 billion in lost revenue annually, which is the equivalent to 4–10% of the global corporate income tax revenue. Third, governmental institutions have, at least partially, failed at ensuring that companies pay a fair share of taxes. The international tax system is based on the 1928 League of Nations model, whose principles proved to be inadequate for taxing profits generated by increasingly digitalized market transactions and globalized business models, giving more opportunities to MNEs for finding legal loopholes among national tax systems and taking advantage of it, more or less aggressively. Moreover, national States themselves are involved in what has been defined as “harmful tax competition” (OECD 2013), that is providing MNEs with favorable tax treatments to attract foreign investments and generate employment in their national territory – thereby distorting international trade and investment patterns causing a distortion that harms other countries eroding their national tax bases.

Finally, within the vast scholarship on corporate social responsibility (CSR), after overlooking the issue of tax avoidance for a surprisingly long time, in the last two decades, there has been a raising view that tax avoidance practices have to be seen as examples of corporate social *irresponsibility*, violating the social contract between multinational enterprises (MNEs) and local communities (Christensen and Murphy 2004).

While tax evasion is unanimously deemed as unethical, since it entails illegal, dishonest, and fraudulent practices, the ethical assessment of tax avoidance has been widely debated. To counteract some of the criticism pointed out above, some scholars argue that businesses operate in a moral free space about their fiscal approach and hence paying tax. MNEs should therefore have considerable discretion as to how to arrange their tax affairs and shop for the most favorable tax treatment (Dowling 2014). This line of argumentation often uses the term of “tax mitigation” or “tax planning” instead of tax avoidance, to indicate ethically sound strategies then every manager can (and, for some

advocates of the shareholder-value maximization, should) pursue to reduce the amount of tax to be paid, in legal and legitimate ways (in fact, professional consultancy groups sell “tax planning” and “tax mitigation” services). It must also be taken into consideration the fact that MNEs are such powerful actors in the global economic system that they often force the legislator to modify tax rules and introduce new legal arrangements to match their innovative strategies and business models.

Various argumentations are advanced to support or ostracize the morality of tax avoidance practices.

## Different Forms of Tax Avoidance

Some preliminary conceptual refinements need to be made before conducting an ethical analysis on tax avoidance. Indeed, there is a wide range of tax avoidance practices raising specific and different ethical issues. In particular, three main forms have been distinguished in the business ethics debate: *state-induced*, *strategic*, and *toxic* avoidance:

- *State-induced* (de Colle and Bennett 2014) tax avoidance refers to the process of reducing the amount of tax based on enumerated provisions in the legislation, which are introduced by a national State to achieve socially or economically desirable ends for its citizens. This is, for instance, the case of tax deductions for charitable contributions (available both to private citizens and corporations); the introduction of fiscal incentives to steer corporate investments towards R&D, to foster innovation in a particular sector; and the tax benefits granted to MNEs that bring their foreign investments within a national territory, to promote job creation and the local economic and social development. In other words, these are all practices that effectively reduce the amount of tax to be paid, but doing so in ways that are even encouraged by a specific government policy (therefore, entirely respecting not only the letter but also the spirit of the law).
- *Strategic* (de Colle and Bennett 2014) or *appropriate* (Lenz 2020) tax avoidance includes all practices in which the tax reduction is one of the many dimensions of a transparent

and legal business strategy with economic substance. For instance, this includes the decision of outsourcing a particular business function that, among other competitive factors, considers and evaluates the resulting tax implications. For example, many European and US companies have set up their customer call centers in India and other Asian countries where the labor cost is much cheaper (including lower social security and other fiscal costs) compared to their home country. These practices add value to the overall business (have a sound “economic substance,” in legal terms), are transparent and legal, even if in some cases they might not be seen in accordance with the intention of the legislator.

- *Toxic* (de Colle and Bennett 2014) or *aggressive* (Payne and Raiborn 2018, Lenz 2020) tax avoidance refers to all schemes and arrangements undertaken predominantly or exclusively with the objective of tax reduction. These practices take advantage of literal interpretations of law, legal loopholes, or mismatches between national legislation, and are developed through the use of artificial structures, transactions, or strategies which lack economic substance. The most recurring toxic avoidance techniques include transfer pricing arrangements (i.e., the arrangement of commercial transactions between entities of the same group with very low or very high prices to reduce the overall tax burden) or the use of shell companies (i.e., a corporation, generally located in tax havens, without significant assets and business operations which acts as tax minimization vehicle). Although usually characterized as legal, the legality of these practices is uncertain, since they contradict the *spirit* of the law, which is the deeper intended meaning or goal informing the legislation.
- *State-induced* (or, *prosocial*) *tax avoidance*. Using a utilitarian perspective, the morality of tax state-induced avoidance is generally justified on the grounds that it is encouraged by States to achieve a social interest. These tax reduction mechanisms are granted to those individuals and businesses engaging in activities which are expected to generate such positive social outcomes which outweigh the reduced tax revenue. Also from a Kantian perspective, these practices seem to be ethically justified, since they require to conform one’s behavior to a prosocial policy designed by the legislator, which can be seen as an action fulfilling the moral duties of a good citizen. Similarly, from the point of view of virtue ethics, these behaviors can be seen as virtuous since they are ultimately oriented at the flourishing of the community.
- *Strategic* (or *appropriate*) *tax avoidance*. Traditionally, strategic tax avoidance is justified using the managerial fiduciary duty argument (Dowling 2014). From this perspective, that frames tax as “another cost to the business,” managers’ duty to maximize shareholder value implies that the tax component should be carefully considered in all strategic business decisions, like any other cost-dimension of business. Rather than defending the moral legitimacy of tax avoidance practices, this line of reasoning is, ultimately, framing tax avoidance as an *amoral* issue – therefore, it lacks any strong ethical rationale. More interestingly, strategic tax avoidance can be morally justified under the stakeholder theory of the firm, which extends managerial duties and responsibilities towards all actors who are affected by, or can affect, corporate activities (i.e., all the company’s stakeholders). From this perspective, strategic tax avoidance can be ethically sound as long as tax savings are used to generate value for stakeholders, e.g., higher salaries for employees, lower prices or better products for consumers, more investments for the development of local communities, etc.
- *Toxic* (or *aggressive*) *tax avoidance*. Only weak and extreme moral argumentations can justify toxic tax avoidance. A first position defends the morality of toxic avoidance on the grounds of its

## Can Tax Avoidance Be Morally Right?

The morality of tax avoidance can be justified according to some lines of reasoning, which are stronger for State-induced avoidance and weaker for strategic avoidance, while toxic or aggressive tax avoidance is almost ethically indefensible.

legal nature: if tax avoidance is (technically) legal, it is ethical. There cannot be any moral constraints on exploiting legal opportunities or on moral duties to pay more than what the law requires. However, this argument is very weak, because it fails to acknowledge that the legality of toxic avoidance is uncertain, since it violates the spirit of the legislation. Finally, toxic avoidance might be supported by more extreme ethical arguments calling for no taxation, using the lens of liberalism (i.e., taxation is seen as an unjustified governmental interference in the natural, free-market ordering of things) and libertarianism (i.e., taxation is seen as an interference with personal liberty and property).

## What Is Wrong with Tax Avoidance?

There are a number of argumentations which lead to a negative ethical judgment of tax avoidance, even if its different forms raise specific ethical issues. These arguments are particularly strong and widely shared with regard to the immorality of toxic tax avoidance.

- *State-induced tax avoidance.* Although introduced by specific national policy with a pro-social orientation, State-induced tax avoidance raises a few ethical issues. The strongest argument relies on John Rawls' theory of justice (Payne and Raiborn 2018): these practices cannot be said to be just and fair when they tend to benefit only the wealthiest in society (i.e., rich citizens, powerful MNEs) because they result in enhancing the social inequalities and the unfair competition with the "least advantaged" (i.e., individual taxpayers and small and medium enterprises). Second, the introduction of favorable tax provisions (e.g., low tax rate) to attract corporations is the cause of harmful tax competition between businesses as well as between countries.
- *Strategic tax avoidance.* In addition to the ethical concerns discussed for State-induced tax avoidance, strategic avoidance can be associated with two additional ethical criticisms. Adopting a consequentialist perspective, strategic avoidance cannot be morally justified

because it may be harmful for society. First, the perception of unfair corporate tax payments by wealthy individuals and large MNEs can reduce the tax morale (i.e., the intrinsic motivation to pay tax) of other taxpayers (entrepreneurs and small and medium firms) who do not have the same opportunities, undermining the compliance culture within the country and the integrity of its tax system. Second, approaching the payment of tax as any other business costs to be minimized, MNEs may reduce the tax resources of their home country – e.g., by shifting their profits to low tax jurisdictions through outsourcing strategies or new subsidiaries abroad (OECD 2013).

- *Toxic tax avoidance.* Toxic tax avoidance practices raise severe ethical issues in addition to those associated with State-induced and strategic avoidance. Various ethical theories and philosophical perspectives lead to consider toxic avoidance as an immoral practice (Scarpa and Signori 2020). From the utilitarianism point of view, there is a consensus that this kind of aggressive tax avoidance practices generates negative outcomes on multiple stakeholders (especially governments, communities, and competitors) that are likely to outweigh the short-term financial benefits for shareholders (Preuss 2012). Under Kant's Categorical Imperative, toxic avoidance should be morally forbidden, because the universalization of the maxim according to which the law can be aggressively interpreted up to the boundary of what is legally permissible against the spirit of the legislation leads to a practical contradiction, since it would endanger the objective of a stable, predictable, and just legal system, on which companies at the same time rely (Lenz 2020). Third, toxic avoidance violates the social contract which implicitly binds companies to the society where they operate. By entering into the social contract, businesses not only enjoy the rights to benefit from public goods and services, but they also owe the moral duty to contribute their fair share to the tax base by abiding by both the letter and the spirit of the law. Otherwise, companies act as economic free riders that enjoy the benefits of being part of a community (e.g., educated

workforce, transport, security, legal system, subsidies, etc.) without accepting the costs. Furthermore, toxic tax avoidance clashes with virtue ethics' focus on agents and moral character development. From a virtue ethics perspective, the good tax accountant of MNEs should prioritize the achievement of excellence in the application of accounting practice and principles over the arrangement of artificial structures and transactions with the exclusive objective of tax minimization (West 2018). A virtue-ethics approach also stresses the moral disconnection within firms engaging in toxic avoidance while professing their ethical behavior in other issues (Preuss 2012).

Furthermore, toxic tax avoidance compromises the redistributive function of tax payments and impairs governments' funds to provide public goods and services (e.g., education, public health care, etc.). Consequently, it poses severe threats to the enjoyment, facilitation, and protection of basic human rights, with severe implications for developing countries. Finally, a sustainable-development perspective acknowledges the externalities of toxic avoidance, especially for future generations. In particular, toxic avoidance erodes some essential common resources that provide value for society and which need sustainable conservation (Bird and Davis-Nozemack 2018): the "social

## Summary

To conclude, the ethical analysis of tax avoidance is not a simple, black-and-white classification into ethical/unethical practices. It requires a nuanced approach, identifying different forms of tax avoidance. By distinguishing among State-induced, strategic, and toxic tax avoidance, one can see that at one end of the spectrum (See Table 1), there are tax avoidance practices that can have stronger argumentations in favor of their ethical justification, being encouraged by a national pro-social legislator. At the opposite end, toxic tax avoidance raises several very serious ethical issues, and only weak and extreme arguments in favor. Between these two extremes, a gray area of strategic tax avoidance practices, that are ethically defensible as long as they are transparent and linked to a sound business substance, but at the same time raise a number of ethical concerns that needs to be taken into consideration, judging in each particular case their relevance in light of the particular socioeconomic context and the stakeholders affected (first of all, taxpayers).

## Definition/Introduction

Divestment is defined as the act of withdrawing investments from a company or industry for ethical or financial reasons. It can be described as a form of socially responsible investing (SRI) that applies nonfinancial (environmental and social) criteria as well as exclusionary screening to guide an investor's financial decisions. While divestment has been most famously pursued against companies compliant in the racial conflicts and human rights violations of the South African apartheid era, the recent fossil fuel divestment movement has burgeoned the largest and fastest growing divestment campaign in history (Hunt et al. 2016).

Fossil fuel divestment is a form of shareholder activism (Gillan and Starks 2000; Guay et al. 2004) seeking to withhold the financial capital and reduce corporate solvency (Caldecott and Dericks 2017) that is needed to explore and to exploit fossil fuel resources (Bauer et al. 2018). Divestment is perceived as a tool to force change upon the fossil fuel industry, by directly depressing share prices through sales of shares (Paum 2015) or indirectly stigmatizing the industry (Ansar et al. 2013) for its influence on increasing concentrations of carbon dioxide (CO<sub>2</sub>) emissions most affiliated with fossil fuel use (Quéré et al. 2013).

The decision to pursue fossil fuel divestment can be made because of both financial and ethical reasons. Grady-Benson and Sarathy (2015) find that fossil-fuel divestment is most often rejected on University campuses for either financial or ethical reasons. Institutional investors have also rejected divestment because it might violate fiduciary responsibilities, though the question whether fossil fuel divestment contradicts fiduciary duty is itself controversial (Waitzer and Sarro 2012). Notably, the arguments in favor and against the ethical and financial case for divestment remain inconsistent. This chapter delves into this discussion and presents a comprehensive perspective from both, proponents and critics of each position.

## Introduction to Fossil Fuel Divestment

Fossil fuel divestment first gained a foothold in mainstream discourse following Bill McKibben's seminal Rolling Stones publication "Global Warming's Terrifying New Math" (McKibben 2012). In this entry, McKibben articulated that if humanity is to mitigate global warming to under 2°, the majority of existing fossil fuel reserves cannot be used. Bill McKibben's article was one of the most widely circulated by the Rolling Stone (Nisbet 2013), bringing the once radical message of divestment to mainstream discourse (Schifeling and Hoffman 2017).

Undoubtedly, fossil fuel divestment has gained momentum. Since its inception in 2012, fossil fuel divestment has been endorsed by prominent social activists including Naomi Klein (2013) and Leonardo DiCaprio (2015), influential religious leaders including former Archbishop Desmond Tutu (2014), politicians including Barack Obama (2013) and Al Gore (2013), notable economists including Paul Krugman (2013) and Jeffrey Sachs (2018), and climate leaders including Christiana Figueres (2015) and Ban Ki Moon (2014). Simultaneously, prominent institutional investors, including but not limited to the Rockefeller fund (2014), Norwegian pension fund (2015), Church of England (2017), and New York City (2018) have all committed to divesting their holdings from the fossil fuel sector or from parts of it, for instance, the coal industry. To date, it is estimated that over \$6 trillion in assets under management have been pledged to divest from the fossil fuel sector (gofossilfree.org 2018).

One mandate of fossil fuel divestment is to raise awareness and reinforce that a significant portion of proven fossil fuel reserves cannot be burned if we are to achieve the two-degree limit in temperature rise (Hunt and Weber 2018). Furthermore, divestment strives to force the energy sector to move away from high carbon sources, by stigmatizing the industry and by reducing its access to financial capital. The consequences of divestment can thus be direct or indirect.

Divestment can directly decrease the price of fossil fuel shares if it is perceived to be a material threat to future growth projections or the valuation of the industry (Paum 2015). Depressed share prices will discount the industry's projected cash flows, raise costs of capital financing, and weaken production capacity in the long run. Alternatively, divestment can indirectly stigmatize the industry (Ansar et al. 2013). Negative stigma associated with divestment can undermine the industry's reputation with other salient stakeholders (i.e., policy makers and financiers), prompt increasingly restrictive legislation, and weaken investor confidence in the industry.

With regard to the impact of divestment, some studies argue that the direct impact is limited given that the small sum of funds being divested cannot significantly affect stock prices (Ansar et al. 2013; Bullard 2014). Moreover, the divested equity will simply be acquired by less scrupulous investors relatively quickly and at a discounted rate (Ansar et al. 2013). In this regard, it may be more beneficial to engage with the industry to pursue change. It is also argued that the decline in stock prices in recent years that has driven the financial case for divestment is more sensitive to changes in macroeconomic environments than to the reputational risks of divestment (Baron and Fischer 2015). Finally, it is notable that divestment would not impact national or state-owned corporations like NICO and Saudi Aramco, that own a large bulk of proven reserves (Paum 2015).

## The Ethical Case for Divestment

Divestment can be understood as a means of social activism, illustrating how stakeholders can collectively mobilize to advocate for social justice (Grady-Benson and Sarathy 2015). In the case of fossil fuel divestment, the social cause is the mitigation of climate change. The first ethical case for climate change assumes that financial gains should not be achieved through investments in practices and shares that harm the climate. Secondly, divestment proponents argue that divestment decreases the fossil fuel industry's

ability to invest in further exploitation of fossil fuel resources that will increase climate change. Thirdly, divestment proponents argue that their campaign influences the reputation of the fossil fuel industry negatively, leading to lower profitability and to changes in the industry's business strategy. Fourthly, it has been suggested that by holding such shares, institutions are complicit in the harm caused to those affected by or are at risk of harm from climate change (Moss 2017).

Governance scholarship recognizes that there are many influential climate actors from governments, to institutional investors, financial markets, corporations, and civil society who have the capacity to accelerate or constrain climate action locally and globally (Bulkeley *n.d.*; Gunningham and Sinclair 2017). Divestment is a strategy by which institutional investors can delegitimize the fossil fuel industry, due to the impact of fossil fuel production on anthropogenic climate change. It could be argued that the stigmatization of divestment has prompted some response by the fossil fuel industry, such as in the case of Peabody, which now cites divestment in its risk disclosure as a factor that may adversely affect demand (Baron and Fischer 2015). In markets with higher social norms, the widespread stigmatization of the industry could result in an underperformance of fossil fuel stocks because of increased negative investor sentiment (Hunt and Weber 2018; Liston 2016). Increased awareness of the linkages between fossil fuel production, carbon emissions, and climate change through the fossil fuel divestment movement can thus indirectly impact the industry.

Moreover, institutional investors may have a moral obligation to divest. There lays an embedded claim, that "if it is in our power to prevent something very bad from happening, without thereby sacrificing anything morally significant, we ought, morally, to do it" (Singer 1972, p. 231). Climate change is increasingly seen as one of the greatest threats to ecological (Ceballos et al. 2015) and human health (Whitmee et al. 2015). Adverse climatic conditions can cause direct injury from extreme weather events, outbreaks of infectious disease, food insecurity and under-nutrition due

to failing local agriculture, and mental health problems attributed to displacement, forced migration, and affected homes and workplaces (Kjellstrom and McMichael 2013). The impacts disproportionately affect poor and marginalized populations, which can cause conflict within national borders and between vulnerable nations (Lynn 2015). In this case, investors might see their ethical duty “not on whether we have contributed in some way to a harm but on whether we ought to do something positive to assist others” (Moss 2017, p. 419).

Critics, however, are uncertain whether divestment as an act of shareholder activism will have any influence on mitigating anthropogenic climate change. First, some investors favor engagement instead of divestment (Sprengel and Busch 2010). They argue that only shareholders can put pressure on firms in their annual meeting and therefore, divestment weakens the influence of ethically concerned shareholders.

Second, the global entrenchment of fossil fuels not only as a source of energy but also through the dependence of fossil fuels across the economy is not addressed by the fossil fuel divestment movement. A study of the University of British Columbia’s pensions and investments found that divesting from all fossil fuel companies in their portfolio would only decrease the University’s carbon exposure by around 3%, given the demand for carbon intensive products in other industries (Ritchie and Dowlatabadi 2015).

Moreover, some groups argue that fossil fuel products are used by many and support economic development. Therefore, fossil fuel producers should not be punished for creating products and services that are bought and used by others. In a similar vein, fossil fuel divestment, by targeting the fossil fuel industry, neglects to address the issue of demand. Divestment might have a negligible influence in combating carbon emissions if demand continues to rise (Grady-Benson and Sarathy 2015). Finally, it could also be argued that divestment from the fossil fuel industry can have negative impacts on the economy and employment in countries with a high dependency on the fossil fuel sector.

## The Financial Case for Divestment

Based on modern portfolio theory (Markowitz 1952), proponents of conventional finance argue that divestment decreases the universe of possible investments, and therefore, it is not possible to achieve optimal risk-adjusted returns. Furthermore, representatives of the efficient market hypothesis (Malkiel and Fama 1970) argue that financial risk would be priced by the financial markets anyway and that additional ethical investment criteria are not needed to identify financial risks caused by carbon bubble and stranded assets. However, there are financial arguments in favor of divestment. We will explain them in the following paragraphs.

The increased production of greenhouse gases (GHG) in the atmosphere has raised global temperatures by 0.8 °C from the preindustrial era (IPCC 2014); nearly half of the globally accepted 2 °C target that was agreed upon in the 2009 Copenhagen Accord. Increased concentrations of carbon dioxide (CO<sub>2</sub>) emissions, most affiliated with increased fossil fuel use (Quéré et al. 2013), continue to accumulate in the atmosphere well above the safe level of 350 parts per million (ppm), effectively raising global temperatures toward the 2 °C threshold (Hansen et al. 2008). In a two-degree scenario, no more than one-fifth of the proven fossil fuel reserves may be burned (Meinshausen et al. 2009). This is the “carbon budget.”

A fossil fuel company’s valuation is in part calculated by its proven reserves and long-term growth potential. It is estimated that over 50% of a firm’s value is dependent on the expected cash flows a decade into the future (Trust 2008). Maintaining the firm valuation is therefore dependent on increased capital expenditures toward continually expanding proven, albeit increasingly marginal reserves (Leaton et al. 2013). Thus, fossil fuel companies continue investing in exploration, to replenish their reserves which may never be used.

Investing in companies that continue to allocate capital to replenishing proven reserves may be a risky decision. If the carbon budget is to be met, the grounded reserves and related

activities may suffer from unanticipated or premature write-downs, devaluations, or conversions to liabilities (Caldecott et al. 2014). A tightening carbon budget and the subsequent devaluation of existing reserves results in what is known as “stranded assets” (Ansar et al. 2013). Markets may be mispricing the risks of stranded assets held by listed companies. In a 2 °C scenario, grounded reserves could put over \$28 trillion at risk; risks most concentrated on high-cost and high-carbon sources of production (Lewis et al. 2014). The risk of asset stranding can dampen future growth projections and depress the industry’s value.

The stranding of carbon assets in the case of fossil fuels can be caused by several environment-related risk factors that are poorly understood and regularly mispriced (Caldecott et al. 2014). A scenario analysis of stranded assets by Caldecott et al. (2014) provides an encompassing framework of the most pressing environment related risks that could lead to the stranding of assets. The report infers that government regulations, environmental challenges, changing resource landscapes, technology innovations, evolving social norms, and litigation may be some common risks to asset stranding. Unburnable carbon poses knock-on effects that not only affect investors but lenders, pension funds, and indeed individual savers as well. Bank lending exposures may face significant haircuts to the value of their loan books, pension funds may risk funding shortfalls to their pension entitlements as fossil fuel investments falter, and savers may face uncertainties akin to financial bubbles as their investments track carbon intensive markets (Campanale and Leggett 2011).

There is also empirical evidence that fossil fuel free portfolios outperform traditional indexes. Regarding environmental risks from the fossil fuel industry, several studies compare the financial performance of prevalent market indices to fossil free counterparts. The MSCI ACWI ex fossil fuels index, for instance, tends to be comparable to or out-perform the MSCI ACWI over a 5-year period (MSCI 2016). Another complementary report by the FTSE finds that its counterpart ex fossil fuel index performs competitively

with lower volatility than the traditional FTSE developed index (FTSE 2014). Yet another study by Sustainable Insight Capital Management finds that of three fossil fuel free portfolios created, all outperformed the S&P 500 across 1, 3, and 5-year periods between 2008 and 2013 (Willis and Spence 2015).

Several newer studies even suggest positive financial outcomes of fossil fuel divestment. Henriques and Sadorsky (2017), for instance, found that divesting from fossil fuel and investing in clean energy increased financial returns because of the higher performance of clean energy stocks. While it is notable that economic factors like oil prices have played a predominant role in recent underperformance of the industry, another study based on long-term data between 1927 and 2016 argues that divesting from fossil fuels does not harm financial returns because the fossil fuel sector does not contribute to divesification (Trinks et al. 2018). Most recently, a study on shares found both higher risk-adjusted financial returns as well as lower carbon footprints for divestment portfolios compared to the conventional TSX 260 (Hunt and Weber 2018). These results are further attested across analyses conducted by organizations like the Carbon Disclosure Project (Fanelli 2012) and Impax Asset Management (Simm 2013), which suggest that by reducing carbon exposure in their portfolio, investors can achieve competitive if not greater returns.

In contrast, there remains a notable body of literature that suggests that divestment will pose significant transitional or risk-induced costs (Grady-Benson and Sarathy 2015). Some studies warn that any form of exclusionary screening may pose costs for investors (Geczy et al. 2005; Renneboog et al. 2008). Other studies postulate that investors may face a cost of pursuing ethical or exclusionary screening, that may lead to increased risks or decreased returns (Richardson 1987). One study by Bloomberg New Energy Finance proposes that fossil fuel investments remain favorable because they offer the scale, liquidity, growth, and yield with which alternative investments cannot compete (Bullard 2014). The report further suggests the market would require

a massive scale-up of new investment vehicles to offer comparable opportunities for reinvestment.

Other studies actively dissuade divestment, under the pretense that it could harm the financial performance of investors and endowments. The first study suggests that U.S. shares of oil and natural gas companies outpaced both the overall performance of university and college endowments and every other asset class examined (Shapiro and Pham 2012). Another study suggests that the “costs to investors of fossil fuel divestiture are highly likely and substantial, while the potential benefits – to the extent there are any – are ill-defined and uncertain at best” (Fischel 2015, p. 3). The last study calculates that divestment could cost millions in lost returns annually, if endowments exchange portfolio diversification for moral imperatives (Cornell 2015) because divestment creates higher administrative costs (Ennis and Parkhill 1986; Knoll 2002).

## Conclusions

This chapter presents an overview about the ethical and financial arguments in favor and against divestment. Both, ethical and financial arguments can be used to justify divestment and to argue against it.

Current empirical studies suggest positive financial impacts of divestment for the investors. These results, however, might be influenced by other external impacts such as a falling price for coal and other fossil fuels or other external impacts. On the other side, theoretical arguments from conventional finance against divestment might be influenced using historical data that cannot be extrapolated into the future because of disruptive economic changes caused by climate change. Hence, more research is needed to study the financial implications of fossil fuel divestment.

Regarding ethical arguments, divestment is one of many responsible investment strategies. Currently, there are discussions about the effect of divestment versus engagement. While the discussion is interesting from an academic

perspective, it should rather focus on how the different strategies can be combined and how they can create impacts if they are used in tandem. The effect of engagement is probably small if investees do not feel the pressure of divestment as a final consequence. On the other side, divestment as the exclusive strategy to put pressure on the fossil fuel industry may also not be successful because many investors are not able to apply the strategy.

## Ethical Behavior and Economics

### Introduction

A fundamentally important assumption in conventional or neoclassical economics is that being ethical is most likely to be harmful to the economy. It can make firms and the larger economy less competitive and it can drive down share value, damaging the position of investors.

Reference here is made only to the owners of the traditional investor-owned firms. No mention, however, is provided of alternative forms of organizations such as cooperatives (member-owned organizations) and state-owned entities or social enterprises. Here too the argument is made that being ethical comes at cost to the firm and to many members of the firm. Moreover, ethical behavior invariably results in more unemployment and higher costs to consumers, resulting in a lower standard of living. But this point is also adhered to by critics of market economies and, more specifically, to critics of globalizing market economies. Market economies are not compatible with a more ethical world. Even many contemporary behavioral economists, who are quite critical of contemporary economic theory, argue that ethical behavior comes at a cost. For many economists, being ethical is a good thing, but one must recognize that being ethical comes at a cost. It is not a free good.

This negative perspective on ethics and the economy stems from some fundamental assumptions embedded in contemporary economic theory. Therefore, it is important to interrogate the empirical validity of such assumptions. Different assumptions can yield a different perspective on ethics and the economy and have significant implications for public policy and for decision-making within firms.

### What Is Ethical Behavior in the Economy

One common definition of ethical behavior in an economy is engaging in good behavior towards others in an economic context and delivering policy to this effect. This need not be self-sacrificing behavior or acts of pure altruism. Advocating for improved working conditions, more environmentally friendly practices, “fairer trade” purchasing (fair trade coffee, chocolates, carpets, etc.), or more community-oriented or sympathetic policies are examples of being ethical. Some would add to this definition a more equitable distribution of income, while others would advocate for poverty alleviation.

Among economists and other experts there are those who argue that in the long run market forces, left largely to themselves, will generate a better life and a more ethical capitalism. Thus, there is an ethical imperative that is embodied in free market capitalism. Interfering with the free market will only cause the most harm to the most vulnerable in our society. This worldview largely flows from contemporary economic theory, very much contained in the contemporary and textbook rendition of the neoclassical theory of the firm. In the minority, there are those, including corporate leaders, who argue that ethical capitalism, one that embraces moral sentiments and sympathy, in the tradition of Adam Smith, is not only possible, but makes for a more productive society. And, it is the responsibility of corporate, community, and political leadership to nudge us in this direction.

### Contemporary Economics: Why Ethics Is Bad for the Economy

The classic statement on why ethics should be considered bad for the economy was clearly articulated by Friedman (1970) in his New York Times article. He argues that the main task of firm leaders is make as much money as possible for the firm and maintain the competitiveness of the firm, as long as this pursuit is legal. Doing anything else violates the ethical obligations of the firm leader to the firm who employs her or him. The challenge that Friedman lays before us is whether or not ethical behavior, being good, is compatible with being a profit maximizer.

From the perspective of conventional economic theory, being ethical increases the costs of production which, in turn, generates higher average production costs. And, this should then reduce the rate of return to the firm. But it is increasing the cost of production that would make the firm less competitive and this is what makes being ethical a costly process and one which is damaging to the economy as a whole. Therefore, being ethical demands that one appreciates these costs and who are directly harmed by virtue of ethically oriented policy.

The potential costs of being ethical become clear when one understands that in a very simply model of the firm (where labor is the only factor input) average cost (AC) equals the wage rate ( $w$ ) divided by labor productivity ( $Q/L$ ). This is illustrated by equation 1, below

$$AC = \frac{w}{\left(\frac{Q}{L}\right)} \quad (1)$$

The wage rate is a proxy for any benefits accruing to employees. Increases in employee benefits increases average costs, all other things remaining the same. The latter is a core and often implicit assumption of both conventional neoclassical economics and that of nonconventional economists. It is important to note that this argument is not at all affected by increasing the number of factor inputs. The same dismal prediction holds. It follows from this theoretical narrative that any ethical act emanating from the firm or imposed by the government, community, or a kind-hearted or community-spirited CEOs will increase average cost. Increasing minimum wages and having unions (and protecting employee rights), legislating improved safety, food quality, and environmental standards, for example, will have the same punishing effect on the economy.

### More Realistic Models and a Dynamic Ethical Market Economy

Conventional economics assumes that all firms are efficient in terms of doing the best they can, given available resources, and that technical change is largely exogenous. It is not affected by the incentive environment of the firm, certainly not by ethical considerations. Doing the best relates to the assumption that all firm members are working as hard and smart as they can. Therefore, the quality and quantity of effort per unit of labor time is fixed and at the highest possible level. Effort discretion is assumed away. However, these two fundamental assumptions are extreme and do not necessarily reflect how firms and their decision-makers and other firm members

behave in the real world. Building on a behavioral theory of the firm and x-efficiency theory (Akerlof 1984; Altman 2005, 2020; Leibenstein 1966), one can realistically assume that firms are not doing the best they can, what Leibenstein refers to as being x-efficient. In this case, effort inputs can vary depending on circumstances. In this theoretical narrative, effort discretion exists, by how much is an empirical question. As the decision-making environment within the firm changes this can be expected to change the level of x-efficiency. Making the firm more ethical, which increases costs to the firm, need not increase average cost, nor need this reduce the firm's rate of return, when being ethical or becoming more ethical also increases productivity. Not only does being ethical not cause economic harm to the firm, but it can also serve to increase the size of the economy pie wherein all firm members benefit from the growth process directly. Ethics is here compatible with a vibrant, competitive, and dynamic market economy (Altman 2005, 2020).

This point is further illustrated in Eq. 1, above. If labor benefits increase by 10% and this incentivizes the firm to increase productivity by 10% there will be no increase in average cost. This argument becomes even more forceful if there are more factor inputs (such as capital and land) under consideration, which is always the case. Indeed, typically labor represents less and at times much less than 50% of factor inputs. In this case, if labor benefits increase by 10% and labor represents 50% of factor inputs, labor productivity would have to increase by 50% of 10% to keep average cost from rising or by 5%. If labor represents 20% of factor inputs (which is often the case), then labor productivity would have to increase by only 20% of 10% or by 2%.

Apart from the impact of ethics on the level of x-efficiency, there is also its potential impact on technical change. The increasing costs to the firm of being ethical or becoming more ethical can induce the firm to develop or adopt technologies that would help neutralize the costs of being ethical. Technological change becomes, in part, endogenous to the incentive environment within the firm, providing the firm with an additional

means of increasing productivity (Altman 2005, 2020).

There is another side to this theoretical narrative. Although the more ethical firms can be expected to be more productive, this does not imply that they will be more cost competitive than their less ethical counterparts. Higher levels of productivity might simply suffice to keep the more ethical firms cost competitive and profitable. On the other hand, remaining relatively unethical or reducing the extent to which the firm is ethical need not make such a firm more competitive. Becoming less ethical simply reduces costs, it does not necessarily reduce average costs since, in this modeling narrative, being less ethical would incentivize the firm to be less productive. In Eq. 1, above, if  $w$  falls by 10% as a consequence of the firm being less ethical and this results in productivity ( $Q/L$ ) dropping by 10%, average cost does not fall. But the size of the economic pie shrinks as does the well-being of employees (and of their community, if being less ethical translates in more pollution, for example). But the income of firm owners and managers need not diminish here. Being less ethical, in this case, will not provide firms with a competitive advantage.

These basic points are illustrated in Fig. 1. With the conventional economics average cost curve, becoming more ethical increases average cost unequivocally. But with the behavioral model, there is a horizontal average cost curve, up to a point, wherein being more or less ethical has no effect on average cost. Hence being more ethical need not increase average cost as is predicted by conventional economics. Technical change is illustrated by a shift of the cost curve from XEME to XETC. This keeps the firm competitive even when it maximizes its level of x-efficiency. Technical change picks up the slack in this case, providing the more ethically inclined firms with an additional degree of freedom to be even more ethical.

An important concern of those critical of encouraging ethical practices relates to their assumed negative impact on employment. Not only is being ethical expected to increase average cost, it is also expected to reduce employment.

**Ethical Behavior and Economics, Fig. 1** Average costs and the costs (and benefits) of being ethical

The conventional model assumes that firms will hire workers based on their productivity. And, it is assumed that the productivity of additional workers and additional hours worked, assuming that all else remains the same, diminishes. The marginal product of labor falls. This is referred to as the “law of diminishing” returns. It is also assumed that the marginal product of labor, related to labor productivity, is unaffected by the wage rate. There is assumed to be no x-efficiency and no technological change that can be induced by increasing the wage rate and improving benefits accruing to workers.

In this scenario, employment is a positive negative function the wage rate and worker benefits. Increasing wages or worker benefits or other ethical consideration force firms to employ fewer workers. Hence, those suffering most from goodhearted efforts to make firms more ethical are the least productive, lowest-skilled workers. This type of model underlies the opposition of so many contemporary economists to minimum wages and unions. These institutional interventions, it is argued, result in a reduction in employment. Moreover, it is argued, to restore employment levels following from a recession also requires a reduction in real wages. If this cannot be achieved employment must remain at relatively low levels.

But the assumptions of this model lack in empirical support. As I discussed above, we need to consider the possibility that increasing wages will incentivize increases in productivity and, thereby, in the marginal product of labor. In this case, increasing the wage, making the firm more ethical, need not generate less employment, as increases in the marginal product of labor would offset the cost of the firm becoming more ethical. This is consistent with the evidence that, for the most part, well-constructed minimum wage legislation and unions are the not the cause of increasing unemployment. Therefore, one can maintain employment while constructing more ethical firms in a market economy. This is facilitated by government and community support to firms that must increase their productivity in the face of higher wages and unionization.

Critical economists, referencing behavioral economics and effort variability, also maintain that real wages must be reduced for employment to be increased, along with increases in aggregate demand. They argue that this can be achieved through mild increases in prices, hence the real possibility of a fairer, higher employment society. But they argue that because of effort variability and workers being able to retaliate against any unwanted and known cuts to real wages by reducing their effort, firms are forced to pay workers a fairer, higher wage (a unique efficiency wage)

(Akerlof 1984). This more ethical wage keeps employment at a lower level than it would otherwise be unless the real wage can be cut through inflationary policy. Fair wages come at a cost. But the alternative behavioral model discussed above suggests that there need not be such a trade-off between a fair wage and the level of employment.

### Some Determinants of Ethical Practices

Market forces cannot force ethical behavior since being ethical need not provide relatively ethical firms with a competitive advantage. It is, therefore, important to recognize nonmarket forces that are conducive to transform firms into more ethical entities. Of critical importance are the mental models adopted or inherited by decision-makers. Mental models are used explicitly or implicitly by individuals to select and interpret information to make decisions. If one believes that a more ethical firm will result in a less competitive and profitable firm, then this option will be rejected by rational and even well-meaning decision-makers. Hence the importance of decision-makers and, indeed, those who can influence the decisions being made, to be knowledgeable about alternative mental models and the realism of these models.

Appreciating that being ethical is compatible with being competitive can change decision-makers' choices on the direction to take their firms and society at large. But it is also important to note that even with a better understanding of the relationship between ethics and productivity some decision-makers might not be willing to risk the possibility that their firms or firms in their communities will not actually transform themselves in the manner predicted in a behavioral model of the firm. This transformation would also require a short-term investment in the firm. It could also entail community or broader government investment in infrastructure, inclusive of investment in education. And there are some firm owners, managers, and government leaders who are not interested in more ethical firms, especially as this would involve changing the manner in which business is done and the firm is organized. They are happy with the status quo (irrespective of how

unethical this might be). However, changing mental models combined with government and community support to facilitate firms transforming themselves into more ethical organizations can facilitate transforming firms into more ethical entities.

Consumers can affect the extent to which firms are ethical since they can express their preferences for more ethical practices inside the firm, be it in manufacturing, service, or agriculture, through their demand for goods and services. Consumers can choose to buy ethical and therefore change the relative profitability of producing in a less ethical manner. But for this to occur consumers must be able to identify which goods and services are relatively ethical. In conventional economics the simplifying assumption is often made that information is perfect as is the ability of individuals to process this information. However, in many instances this assumption, apart from being empirically incorrect, generates misleading analyses of human behavior and policy prescriptions. In the real world of imperfect, asymmetric, and costly information, what is critical is product labeling that is credible, similar to ingredient labels for foodstuffs and, in some instances, information provided on financial paper. When the price point for ethical and nonethical products are the same, controlling for quality, one would expect that ethical products and, therefore, ethical practices in the process of production and distribution will dominate the marketplace. This would be the case even if decision-makers are narrowly self-interested and completely lacking in any sympathy for their employees, communities, and the environment. When ethical output is more expensive then there still should be a movement towards more ethically produced goods and services for those who can afford these and are willing to sacrifice to purchase ethical output.

Ethical practices can also be facilitated by market forces under particular institutional environments. With the elimination of slavery and serfdom and governments reducing barriers to labor mobility, tight labor markets, a product of significant demand for output yielding excessive demand for labor, improves the bargaining power of labor. In this case, market forces empower

workers to demand higher wages and improved working conditions even without unions. This, in turn, incentivizes firms to be more productive by increasing the level of x-efficiency and engaging in more technical change, so as to remain competitive. The empowerment of unencumbered workers through market forces underscored Adam Smith's emphasis on increasing trade across regions and nations as a means of improving the well-being of the laboring population, serving to lift them out of poverty, even over the objections of many employers. The introduction of unions further facilitates improvements in the bargaining power of labor with potential positive effects on firm productivity.

### The Ethics of Consumer Sovereignty

From the perspective of conventional economics, it is assumed that consumer sovereignty exists and, therefore, decisions made by consumers reflect their true, genuine preferences. Hence, it would be ethical to respect consumers' choices, unless these choices cause harm to others, such as rape, pushing drugs to children, and murder. This assumes that consumers have the requisite information to engage in free choice, that they can assess and understand this information, and that they have the power to exercise their true preferences. But in reality, these necessary conditions for the existence of consumer sovereignty all too often do not exist. From this vantage point, what becomes critical is to provide individuals with the capabilities and the overall decision-making environment wherein individuals' true preferences can be realized (Altman 2020; Sen 1988). In this way individual liberty is both enhanced and respected.

However, some behavioral economists have argued that individuals are *hardwired* to be persistently biased and error-prone in their choices, making decisions they deem to be optimal but actually (from the experts' perspective) not in the individual's best interest. Therefore, experts (choice architects) should be able to nudge consumers to make choices that the experts deem to be in the individual's best interest (Thaler and Sunstein 2008). But it appears that suboptimal

choices are more a product of a poor decision-making environment than flawed human decision-makers.

### Conclusion

Contrary to conventional economics, ethical behavior need not make an economy less competitive, reduce profits, increase average costs, and increase unemployment rates by reducing employment, especially among the most vulnerable members of society. These predictions are largely based on assumptions that have little empirical validity. Indeed, it is quite possible, under a different more realistic set of assumptions that ethical behavior can be an engine of economic growth, and one that generates fairer more equitable outcomes. Much depends on how the firm is managed, the power relationships within the firm, the preferences and mental models of decision-makers, and the decision-making environment. Moreover, to the extent free individual choice is a critical ethical principle, this principle can be adhered to while improving the benefits to the individual and society given an appropriate decision-making environment wherein individuals' decision-making capabilities are nurtured and enriched. The state of the decision-making environment is critical (Altman 2020).

## Ethical Blind Spots and Accounting

### Introduction

Accounting scandals are often blamed on accounting professionals’ ethical lapses caused by self-interest and deficiencies in ethical judgments. In some cases, these scandals have resulted in significant loss of confidence in the accounting profession and also in the demise of one of the top five international accounting firms, Arthur Andersen. Failures to act ethically can result from individuals who consciously ignore ethical considerations in favor of self-interest but may also result from their inability to recognize the

ethical implications of their decisions, known as ethical blindness.

Ethical blindness (Palazzo et al. 2012) occurs when decision-makers are blind to the ethical dimension of their decision. This may occur due to contextual or decision factors that obscure ethical issues from decision-makers, allowing them to act unethically without being aware of it. This article applies the concept of ethical blindness to the accounting profession, expanding on Palazzo et al. (2012) and Bazerman and Tenbrunsel (2011), to identify potential accounting ethical blind spots.

### Ethical Blindness

One focus of accounting ethics research, as in general business ethics literature, is on models of ethical decision-making that rely on individuals making rational and deliberate ethical decisions. These models recognize that individuals’ decisions will be influenced by situational and individual factors but rely on cognitive processing as the basis of decision-making. Intuitive and automatic processing models, by contrast, recognize that individuals often make decisions with limited rational or deliberate thought (Gigerenzer 2008; Haidt 2001). This automatic processing may result in ethical blindness where the ethical issues are not recognized. Ethical blindness can cause even individuals with high levels of ethical reasoning and capability to act in ways that violate their ethical principles.

The literature in accounting and business ethics, although focusing primarily on deliberative decision-making, has not completely ignored the need for decision-makers to recognize the existence of an ethical issue in order for them to act ethically. Ethical sensitivity (Rest 1979) is the recognition that an ethical issue exists and is considered the first step in ethical decision-making models. When individuals fail to recognize that an ethical issue exists, through lack of ethical sensitivity, then they may not recognize the ethical implications of their actions, which is parallel to ethical blindness. Research on ethical sensitivity has found that individual characteristics of

accountants, such as age, professional commitment, organizational commitment, and level of relativism, are significant to their ability to identify issues (Karcher 1996; Shaub et al. 1993; Shaub 1989). Ethical blindness may result from a lack of ethical sensitivity to the presence of an ethical issue.

Identifying the possible antecedents of ethical blindness is important, since increasing ethical reasoning levels and strengthening codes of conduct are not likely to aid individuals if they cannot see the ethical issue. Several potential causes of accountants' ethical blindness are detailed below.

## Causes of Accountants' Ethical Blindness

### Ethical Fading and Language Euphemisms

Blindness can be created through ethical fading, where the ethical considerations of the decision are no longer visible (Tenbrunsel and Messick 2004). Ethical fading is the process of removing the ethical considerations or moral implications from the decision being made (Tenbrunsel and Messick 2004), allowing individuals to act against their own moral values while, at the same time, not realizing they have crossed this line.

One cause of ethical fading and, in turn, ethical blindness is the use of euphemistic language. Language euphemisms take ethically laden, harmful terms and relabel them into harmless or neutral terminology (Bandura 1999). Browning (2003) argues that business schools use cold language that desensitizes business students to the ethical and human elements of their decisions. Terms like "profit maximization" and "cost – benefit analysis" focus on the economics of the decision at the expense of the human costs involved.

Accounting is rife with the use of language euphemisms: "creative accounting" instead of "aggressive accounting," "income smoothing" instead of "income misreporting" or "income shifting," "earnings management" instead of "earnings manipulation," and in all cases an absence of the word "deception" or "lie." The use of these language euphemisms suggests conditions ripe for ethical fading and thus ethical blindness of accountants making these decisions.

Butterfield et al.'s (2000) experimental evidence provides support for an increase in ethical blindness when amoral language is used instead of moral language. Accounting is embedded in language euphemisms which are likely to create ethical blindness.

Ethical fading can also occur through repeated exposure to ethical dilemmas, numbing accountants to ethical issues (Bandura 1999). Earnings management, the intentional alteration of a financial result using either changes in accounting numbers or changes in economic decisions, is common among firms. Although earnings management may be legal and may be structured to conform to accounting regulations, it may raise ethical concerns that need to be addressed, as there is the clear potential for end users to be misled about the real state of the corporation. The need for companies to meet their earning targets puts pressure on them to use tactics like this if their financial results are not at the levels anticipated. When these practices become routine, the question of their ethicality can become absent causing the accountant to become blind to the ethical implications of the decision.

### Ethical Blindness in Decision Framing

Due to cognitive limitations in decision-making ability (Chugh et al. 2005), individuals use heuristics or simplified decision rules to make their decisions. These heuristics and decision rules include the way the decision is framed. Ethical blindness can result from accountants' framing of their decision and their use of heuristics, when the frame or heuristic fails to include ethical issues. Individuals use decision frames to facilitate their decision-making process. Decision frames (March 1994) define the problem and stipulate the information needed to solve the problem and the dimensions used to evaluate the problem. When the decision frame does not include ethical issues, it can create ethical blindness since ethics will be absent from the problem definition, information search, and evaluative criteria.

Accountants need to determine what type of decision they are confronted with in order to know how to solve it. This definition of the decision is the framing that the accountant applies. They will

examine the situational and contextual features of the decision, along with their prior history making decisions, to determine the appropriate frame. The frame of the decision determines the appropriate decision parameters for the accountant, what information is important to the decision, and what criteria to apply to make a decision. Managers' unethical decisions have been blamed on the application of an economic frame (Punch 1996), blinding them to other perspectives and ethical issues which are not the focus of the economic frame. Economic frames, which are common in our profit-oriented work environments, stress economic gains and losses and neglect to include social and societal gains and losses. In the same way, if accountants frame their decisions using an economic frame or a technical frame, then they too may be blind to ethical issues.

Similar to decision framing, accountants use scripts to assist in solving problems (Gibbins 1984). These scripts act as a heuristic by simplifying the decision and providing a map or template for how to make the decision, reducing the conscious cognition required. These scripts for accountants focus on the technical aspects of the decision, for example: does the accounting treatment conform to the standards (GAAP)? What are the economic costs and economic benefits of the decision? Rarely are ethical considerations included in the script. For example, are accounting treatments understandable to the users of the financial statements, is there possible deception, is there a cost to society? The omission of ethical elements from accountants' decision scripts creates ethical blindness, which may result in unethical actions.

### Financial Goals

The ideal of any profession is public service, but the opposite can result due to self-interest caused by monetary rewards and financial goals. Organizational objectives of increased profitability may conflict with the objectives of society and other stakeholders. Professional accountants may work in a variety of contexts, for example, within a company assisting in the production of the financial information or as an auditor in a public

accounting firm where they provide assurance on the financial statements of the firm's clients. Regardless of position, professional accountants have a duty to the users of the financial information they produce or the audit opinion they provide, per the codes of professional conduct. These codes highlight the supremacy of the public interest over the interests of the professional, their employers, or their clients. However, self-interested goals, such as maintaining their position with their employer, may focus the accountant on the needs of the employer and blind them to the needs of the public.

The profession has incorporated conflict of interest standards within the professional code to minimize auditors' conflicts and maintain their independence from their clients which may reduce ethical blindness caused by self-interest. However, for professional accountants working outside of auditing, and especially those preparing financial statements, the prevalence of short-term financial goals and the need for the employing company to meet analysts' expectations can focus them on financial performance goals to the exclusion of all other considerations. This drive to meet the numbers in order to safeguard their employment and employer may obscure the effect of bias in the financial reporting on the users of the financial statements, in contrast to users' supremacy of right in the code of conduct. Short-term financial goals may provide sufficient pressure and focus for the professional to produce ethical blindness.

Accountants' self-interested bias cannot only create ethical blindness regarding their own ethical misconduct but can also be extended to ethical blindness regarding their co-workers' and clients' behaviors. Bazerman and Tenbrunsel (2011) categorize this as motivated blindness, where the individual fails to see the unethicity of those around them because of the benefit they derive from the action. One example of motivational blindness given by Bazerman and Tenbrunsel (2011) is the failure of Arthur Andersen auditors to identify the misconduct of Enron. Arthur Andersen was blind to the misconduct of Enron, even though Enron was underreporting their liabilities and

misleading the shareholders. Arthur Andersen continued their relationship with Enron and continued to bill Enron for millions of dollars in fees. Due to the lucrative engagement, Arthur Andersen was blind to Enron's misconduct, which ultimately led to the demise of the firm.

## Combating Ethical Blindness

Given the significant susceptibility of accountants to ethical blindness, it is critical that we incorporate means to combat ethical blindness into our ethics education and organizational features. Accountants' ethical blindness may be reduced by reducing language euphemisms, addressing the scripts and frames they use when making decisions, and increasing their self-awareness of their ethical limitations and ethical blindness.

Accountants' use of language euphemisms is not unique; business is full of them (Browning 2003). It may be difficult to reduce their use, given their prevalence; however, calling a spade a spade or a lie a lie may reduce the ethical blindness of accounting professionals. If we continue to use terminology void of ethical context in accounting, then it is likely that accountants will continue to be blind to the negative ethical issues relevant to their decisions. When financial information is presented in a certain way with the intention of changing the decision of a user, it is important for accountants to consider the effect of this change on the users of the financial statements. Maybe an accountant would think twice if they had to consider the effect on the public. Accounting ethical blindness may be reduced if accounting educators and organizations started to use language that incorporates the ethical tone of the actions, "lying," "deception," and "fraud" to start with.

Accountants' decision scripts and frames provide them with the template to make their decisions. If professional organizations, corporations, and educators stress ethical issues and add these issues and considerations to their decision models, then accountants may include these in their internal decision scripts. The inclusion of these elements in the decision scripts will

highlight these issues when the script is applied by the accountant, reducing their ethical blindness. This does mean a significant adjustment to these decision models. Instead of treating decisions as a simple technical application of accounting standards or an analysis of the economics of a management decision, these models must incorporate the effects on society and on the financial statement users. In so doing, accountants may move into ethical awareness and out of ethical blindness.

Expanding accountants' goals can increase the fluidity of their decision frames, expanding what they perceive as decision relevant and decreasing ethical blindness. Accountants' need to frame decisions in order to simplify their decision-making is critical given the limitation in cognitive processing. This framing, however, does not have to be narrow or rigid. Financial or economic framing has been characterized as narrowly focusing on economic costs and benefits and of being rigid by not allowing decision-makers to easily apply alternative frames. The more rigid the framing, the more susceptible accountants are to ethical blindness. In essence, if accountants narrowly frame the decision as an economic decision or a technical decision and this frame is rigid, then they will not have the ability to switch or expand their frame to include alternative valid frames which may include ethical issues. Organizational goals that focus on short-term financial performance alone can activate an economic frame, increasing accountants' ethical blindness. This frame is narrow, and without additional goals, it is rigid. By expanding the goals of the organization to include additional nonfinancial goals, like CSR, accountants are able to activate multiple valid frames, increasing the fluidity of the decision framing and reducing their ethical blindness (Fiolleau and Kaplan 2017). Organizations that wish to reduce the ethical blindness of their accountants may wish to consider expanding their organizational goals and incentives to include noneconomic goals.

Finally, Bazerman and Tenbrunsel (2011) argue that simply increasing individuals' own awareness of their ethical limitations and

blindness can help to reduce ethical blindness. Increasing accountants' ethical self-awareness may be one way to reduce ethical blindness and ethical misconduct. What should educators and organizations focus on in order to increase self-awareness? In addition to focusing on codes of ethics, ethics oaths, and models of ethical decision-making, we need to teach accountants to understand their own cognitive limitations and biases in their decision-making. Accountants can benefit from examining their own decision-making model that they apply to technical accounting decisions and by asking themselves questions about the decision, such as:

1. Are there any ethical issues that should factor into the decision?
2. What are the decision issues or considerations that the users of the financial statement care about?
3. Could the accounting treatment proposed be considered a misrepresentation to the users?
4. Does this decision affect the public or society?
5. Are there any privacy issues that need to be taken into account?
6. How would a non-accountant approach this decision, and what issues would they find important?
7. Do I have any biases or incentives that may influence my decision; for example, does the outcome of this decision affect my performance appraisal or bonus in some way?

This self-reflection can assist in recognizing accountants' own ethical blindness. In addition, organizations can implement a process of post-decision reflection which would allow the accountant to reflect on their decisions after they have been implemented. For example, if the accountant is making a production decision, then they could be required to do an assessment of the merit of the decision post-decision, once the results have been realized. This assessment should include not only the economic effects of the decision but the effect of the decision on the employees of the organization, the financial statement users, society, and the environment. Accountants can incorporate the

feedback of the comprehensive analysis of the decision into their ethical self-assessment.

Ethical blindness can obscure ethical issues from accountants' decision-making process, which can cause them to take an unethical action without conscious knowledge that they have violated their own moral principles. Several organizational and professional features contributing to accountants' ethical blindness have been identified, and steps to help reduce ethical blindness have been identified. Accountants' ethical blindness needs to be minimized as they have a duty to society, and their unethicity can result in significant harm to the public.

## What is Ethics?

It is important to distinguish between and among law, morality, and ethics. Laws are the norms of society as codified by the public's elected representatives at the local, county, state, and federal levels. Morals are the principles on which judgments about right and wrong behavior are based, most often as sanctioned by a religious institution. Ethics is the "science" by which we assess morality and law, using reason and judgment to reconcile conflicts between values that might have merit individually. Ethics is about "ought to" not "must." It is about fairness; honesty; honor; consistency from setting to setting and person to person; integrity; independence of judgment; evenhandedness; impartiality; freedom from favoritism, self-interest, and personal preference; trust; and mutual respect.

## Ethical Citizenship and Business Ethics

Robert A. Scott

### Introduction

There are many connections between citizens and business. Not only are citizens the consumers of business products and services, but also citizens are the leaders, staff, suppliers, teachers in the schools that prepare employees, and members of the public authorities granting necessary approvals to all enterprises. Business organizations, like others, serve multiple roles as "quasi-citizens." They assert positions in their mission statements; act through their behavior in offices,

## What is Citizenship?

Citizenship indicates membership in a society, a state of being vested with the rights, privileges, and responsibilities of a member of that society. The citizen is an actor in a society who understands the mutual obligations of the individual to the society and the society to the individual.

A democratic society is one in which individual citizens have the right to vote for their representatives in fair and open elections, have access to a system of jurisprudence that is based on the rule of law established by the public's representatives and not by the rule of an individual leader, and have mutual obligations of responsibility with the community such as serving on juries and in the military.

Democratic societies vary in the way in which they organize economic and fiscal policy.

In some Western democracies, citizens confuse the political system of the society with the economic system. In the United States, this is evident

when people claim that it is a capitalist society. In fact, it was founded to be a democratic society with a form of capitalism as its economic system. The difference is critical.

## Capitalism as a Foundation for Business

Capitalism is an economic system in which trade and industry are controlled by private interests and not the state. A capitalistic society is one in which the primary value is property, with the amount of property and money often equated with the intelligence and authority of the owner. Such a society is one in which profits and competition are core values. Capitalism does not give high priority to equality of treatment, humane conditions for workers, education and training for all, or a “safety net” for the most vulnerable of society. Greed and selfish behavior are not unknown in what is called “corporate welfare” and “crony” capitalism. These situations exist when there are special relationships between government and business designed to limit competition and when there are conflicts of interest between parties in a position to benefit from “inside” or confidential information.

Some advocates for capitalism argue for a system of “free” enterprise, an approach that opposes government regulations. However, most regulations are related to the health and safety of workers, consumers, and bystanders. These measures include goggles to protect the eyes of workers and braces to protect their backs when doing heavy lifting, seat belts in automobiles to protect drivers of cars and trucks, and helmets to protect motorcycle riders whose accidents hurt not only the rider but cause significant public healthcare expense. Other regulations are designed to protect the rights of workers whether they have union representation or not. Another type of regulation controls the flow of waste and effluent that can pollute air and water. Therefore, democratic capitalism is not free of controls. The public and workers expect to be protected.

The nature of capitalism has changed over time due to increased globalization, the increased size

of corporations, with some nonbank financial institutions being deemed as “too big to fail” and subject to extra scrutiny due to their systemic influence on the economy, limits on new business start-ups due to banking policies and some regulations that do not take the size of the enterprise into account, and the shift from an economy in which the transformation of materials into products was paramount to one dominated by financial transactions often controlled by algorithms.

## Alternatives to Capitalism

Just as the terms capitalism and democracy can be confused, so also the terms communism and socialism can be confused. This confusion is often caused by politicians and others who advocate a particular perspective on communism. Communism is a political theory that supports an economic system advocating the abolition of private property and the common sharing of resources without private ownership. A communist society is run by dictatorship. There are no democracies that have communism as a political or economic system.

However, there are democratic societies that have a system of socialism. In these cases, there is democratic control of the means of production and social ownership of property through public, collective, or cooperative ownership systems. There also are both market-based and nonmarket-based systems of socialism. Market socialism embraces the profit motive, but the profits either are controlled by the workforce or accrue to society at large. Nonmarket socialism is designed to avoid the inefficiencies and crises generally associated with the profit system. Therefore, some societies moderate their capitalist systems with socialist policies.

## What is Business Ethics?

The term “business ethics” applies to the actions of businesses and their treatment of employees, customers, vendors, neighbors, the environment,

etc. There have been many examples of companies with eloquent codes of ethics that nonetheless violated even their own stated standards of good practice. Nevertheless, the term “business ethics” suggests that there is an alignment between a business’s stated values and its actions.

Some scholars of business discuss “corporate social responsibility” as a best practice. This means that the business articulates and acts on concerns for societal and environmental impacts as well as for financial results. Societal impacts include behavior toward employees’ welfare in terms of compensation, benefits, required hours of work, equal treatment, training, formative evaluations, and related items. Societal impacts also include corporate behavior in terms of community involvement and philanthropy, payment of taxes, abiding by local, state, and federal regulations, support for public schools, honoring the society that grants the charter for the business, allowing employees time to vote, honest advertising and promotional materials, and honoring the ideals of social justice.

Environmental impacts include energy controls and use, manufacturing and extraction rules, construction and purchasing practices, and travel and transportation policies that limit carbon emissions and other negative effects on the environment.

Corporate codes of ethics are applied to actual and apparent conflicts of interest. Some conflicts are permissible if they are made known, do not give special advantage to one party, and are approved by a governing body such as a board of directors. Potential conflicts are not confined to financial matters, but may have to do with other forms of relationship. For example, the interrelatedness of directors is subject to ethical scrutiny. Off-line agreements, or acting together without the knowledge of other directors, can undermine director obligations to the standard corporate duties of care, obedience, and loyalty.

One arena in which the role of ethics can be highlighted clearly in the corporate setting is in the example of a company with a large amount of excess cash. It has the opportunity to invest in

research and development for new products, hire additional staff in order to increase productivity and volume or relieve worker stress, invest in equipment to increase productivity, improve compensation through enhanced salaries and benefits, contribute to the community through charitable contributions, invest in equipment and systems that will reduce its impact on the environment, or use the extra cash to buy back stock. All choices are legal and generally considered moral, but the last option gives unequal advantage to corporate officers because they likely own more stock options than others, especially other employees.

This is an example of a management action that is legal, and some would say is not immoral, yet raises questions because it gives unfair advantage to some parties over others. It fails the “fairness” test, the test of “fair dealing.” The legality and morality do not withstand ethical scrutiny.

According to Dubinsky, ethical behavior by business encourages trust in the people and products of the firm, sets the tone for relations with others, provides a strong foundation for transactions, promotes an ethical environment, yields a positive reputation, reduces internal costs related to unethical behavior, anticipates problems, and supports the firm’s self-interest (Dubinsky). One of the earliest advocates for such behavior was Hammurabi, who, in the interest of consolidating his reign over disparate lands, began to codify laws that would “make justice visible” so that “the strong might not injure the weak” (Code of Hammurabi).

## Ethical Citizenship and Business Ethics

While a business is not a “citizen” per se, it is an actor in society with rights and responsibilities. It cannot do whatever it pleases, needs permission to undertake various roles, and has reciprocal relations with other parties in society. Every business has one of the two critical relations with society. The one most often referenced relates to the “shareholders” of the business, the stockholders of publicly traded companies. This form of

relationship gives higher priority to the company's financial interests than to any other.

The second type of relation is that of the "stakeholder." This approach places responsibility for the mission, employees, customers, and communities over the goals of profitability, although profitability must be achieved. Some refer to this approach as the "triple bottom line," i.e., taking into account the social impact, environmental impact, and financial impact of the corporation. In this case, finances are not ignored, but neither are the impacts on societal interests or the natural ecology. This approach to value results from a governance system that fosters a culture of conscience, i.e., behavior based on ethics, as well as a culture of compliance, i.e., motivated by complying with laws and regulations to avoid sanctions.

The culture of conscience fosters open-mindedness, intellectual humility, moderation, civility, and respect. It requires management to operate on the basis of pragmatism instead of acting on raw instinct or some abstract ideology. The culture of the corporation should make compliance a matter of conscience. This is the responsibility of leadership as it fulfills the goals of the board and guides the actions of management.

## Conclusion

Ethical citizenship and business ethics intersect when we advocate for corporate decisions that are objective; independent and free of bias; fair to employees, consumers, and the community; and free of conflicts of interest between and among corporate directors, executives, managers, and public officials.

## Ethical Climate and Ethical Culture

## Synonyms

Compliance climate; Compliance culture; Implicit ethical context; Informal ethical context; Moral climate; Moral culture; Soft controls

## Definition

An organization's *formal* ethical context is distinct from its *informal* ethical context. The formal context, also known as hard controls, consists of the tangible and explicit parts of an organization, such as its plans, policies, and procedures. An

ethics program is regarded as the most relevant component of the formal ethical context and consists of ethics instruments and measures, such as a written code of ethics, an ethics training module, a policy on whistle-blowing, and an ethics monitoring system.

The informal context, also called soft controls, consists of the intangible and implicit parts of an organization, such as the shared assumptions, values, and expectations. Two of the most important components of this ethical context are the organization's ethical climate and ethical culture. An organization's ethical climate refers to the shared perceptions of managers and employees about what constitutes ethical and unethical behavior in the organization. Its ethical culture is the shared perceptions of managers and employees about the conditions in the organization for ethical behavior. In other words, ethical climate is substantive, whereas ethical culture is procedural.

## Models

### A Model of Ethical Climate

Victor and Cullen (1987, 1988) have developed the most popular model for the ethical climate of organizations. Based on Kohlberg's theory, they developed a two-dimensional matrix of nine theoretically possible ethical climates. The first dimension of the matrix refers to the kinds of criteria and the second to the level of analysis. Kohlberg specified three major ethical criteria: self-interest, caring, and principle. These three standards also reflect three major classes of ethical theory: egoism, utilitarianism, and deontology. These theories may be distinguished in terms of their basic motives: maximizing one's own interests, maximizing joint interests, or adherence to universal principles, respectively. According to Victor and Cullen, the climate of an organization evolves along a dimension similar to Kohlberg's three ethical standards. In addition to these three criteria, the level of ethical analysis may help distinguish the types of

climates found in organizations. The three levels of analysis are individual (the basis for ethical decision-making comes from within the manager or employee), local (the source of ethical role definitions and expectations come from within the focal organization), and cosmopolitan (the source or reference for ethical decision-making is external to the individual and focal organization). Based on their exploratory factor analysis, five types of ethical climates emerged (cf. Martin and Cullen 2006):

- Climate of Caring: managers and employees are expected to be most concerned about the good of everyone within and outside the organization.
- Climate of Laws and Codes: managers and employees are expected to consider first whether a decision violates the law or other external codes of conduct.
- Climate of Rules: managers and employees are expected to strictly follow the organization's rules and procedures.
- Instrumental Climate: managers and employees are expected to do everything in the interests of the organization.
- Climate of Independence: managers and employees are expected to follow their own personal moral convictions.

### A Model of Ethical Culture

To date, the most extensively developed model of the ethical culture of organizations is by Kaptein (1998, 2008). He conducted a qualitative analysis of 150 diverse cases of managers' and employees' unethical behavior that were caused by a failing organizational culture. Subjecting the resulting list of items of the ethical culture of organizations to exploratory and confirmatory factor analyses resulted in eight dimensions of the ethical culture of organizations, called organizational virtues. The greater the level of embeddedness of these dimensions in the organization, the higher the ethical quality of the organizational culture and the more likely the occurrence of ethical behavior. The ethical

| 5. | Motivation for ethical behavior      | Animosity                  | Supportability         | Zealotry                |
| 6. | View on ethical behavior             | Opaqueness                 | Transparency           | Overexposure            |

culture of an organization is the extent to which managers and employees perceive these virtues to be embedded in their work context. These organizational virtues are:

- Clarity: the organization makes concrete, comprehensive, and understandable to managers and employees what sort of ethical behavior is expected of them.
- Congruency of (senior) managers: the organization's (senior) managers set a good example for employees regarding ethics.
- Congruency of supervisors: the organization's supervisors set a good example for employees regarding ethics.
- Feasibility: the organization provides sufficient resources (e.g., time, budget, information, equipment) for employees to behave ethically.
- Supportability: the organization creates a shared commitment to behaving ethically through fair treatment and mutual trust within the organization.
- Transparency: the organization makes ethical and unethical behavior and their consequences visible to those who can act upon them.
- Discussability: the organization provides room within the organization for managers and employees to raise and discuss ethical dilemmas and alleged unethical behavior.
- Sanctionability: managers and employees are punished for behaving unethically and rewarded for behaving ethically.

In Kaptein's model, the dimensions of the ethical culture of an organization consist not only of the presence of the abovementioned virtues (the ideal situation) or their absence but also of the excess of any (or all) of the virtues: an organization's culture can also be too good. An ethical culture is the non-arithmetic middle between the vice of deficiency and the vice of excess. The resulting list of virtues and vices is shown in Table 1.

## Questionnaires

Both abovementioned models of the ethical climate and the ethical culture have been operationalized into a validated questionnaire. The Ethical Climate Questionnaire developed by Victor and Cullen (1988) and further validated by Cullen et al. (1993) and Vaicys et al. (1996) consists of five subscales: climate of caring (seven items), climate of law and code (four items), climate of rules (four items), instrumental climate (seven items), and independence climate (four items).

Kaptein (2008) operationalized the virtue model for the ethical culture of an organization into a 58-item questionnaire. DeBode et al. (2013) developed a shortened version by performing a confirmatory factor analysis and keeping the four highest loading items for all eight dimensions, which resulted in a 32-item scale.

## Value of Ethical Culture and Ethical Climate

Treviño and Weaver (2003) found that ethical climate and ethical culture are distinct constructs but that they strongly correlate with each other. They also found that both constructs are related to unethical behavior but that ethical culture explained unethical behavior better than ethical climate did because the latter is related to the attitudes of managers and employees whereas ethical culture pertains more specifically to the factors that influence the behavior of managers and employees.

Kaptein (2011) found that four of the five types of ethical climate had a significant relationship with unethical behavior. However, the significance disappeared when ethical culture was entered in the analysis. Only ethical culture accounted for the variance in unethical behavior and even for a much larger variance (27%) than ethical climate alone (7%).

Besides unethical behavior, ethical climate and ethical culture have been found to influence many relevant variables in the context of work and organizations. Some of these variables are the ethical judgments, citizenship behaviors, attitude toward whistle-blowing, job satisfaction, innovativeness and efficiency of managers and employees, the organization's financial performance, and the customers' satisfaction (cf. Simha and Cullen 2012).

The following are some of the research findings about the informal ethical context of organizations that make it a relevant construct:

- Each of the dimensions of the informal ethical context can be embedded within an organization in different degrees (Victor and Cullen 1988; Kaptein 2008).
- Each of these dimensions can have a different impact on ethical behavior within an organization (Kaptein 2011).
- These dimensions each require different types of intervention (Kaptein 2009).
- The informal ethical context of an organization can improve and deteriorate over time (Kaptein 2010).
- The informal ethical context of an organization can differ substantially within an organization, such as between job levels (Victor and Cullen 1988) and teams (Cabana and Kaptein 2019).
- The informal ethical context of an organization can differ substantially between organizations (Victor and Cullen 1988; Kaptein 2008).
- The informal ethical context of an organization can differ between industries (Kaptein 2010).

## Ethical Considerations for the Presenter and Performing Artist Dynamic

Presenter and Performing Artist Dynamic

### Introduction

Any discussion of ethics in this entry is meant to be inclusive and exploratory and endeavors not to be positional and conclusive. The chosen scenarios arise from negotiating circumstances within the artist-manager-presenter realities found in the classical arts industry. Furthermore, it focuses on ethical considerations within the lens of business relationships in this field, adopting a structure which looks at duty, consequence, social contract, and personalistic ethics. This is a framework applied by Lewicki et al. (2011) based on work by Hitt (1990).

### Negotiation

Negotiation is “a form of decision making in which two or more parties talk with one another in an effort to resolve their opposing interests” (Pruitt 1981, xi). Classical artists generally do not like talking about money, let alone agree there exists any opposing interests between their

needs and those of the presenters engaging them (McSweeney 2014). The classical arts industry is predominantly non-profit, which perhaps fuels the general avoidance by the industry’s participants of admitting attraction to money. Furthermore, since there are significant consequences to those with reputations of dishonesty or avarice, the classical arts industry is often policed through public opinion and the fear of backlash from gossip.

The industry’s environment of avoidance is driven by its largest volume of participants, the artists, who often avoid the topic altogether. As much as possible, they let the managers or presenters handle those details. Several examples will be examined, of interactions between the artist and their managers, managers with presenters, and the presenter with the artist.

### The Ethical Consideration Framework

Hitt (1990) identifies four ethical constructs: duty (deontological) ethics, which considers obligations as they relate to universal standards and principles; consequence ethics (or consequentialism); social contract ethics, where action is determined by the customs and norms of a community; and “personalistic” ethics, where rightness is determined by one’s conscience. This is a helpful framework when examining scenarios in the classical arts industry.

### Scenarios

#### Manager-Presenter

“Whether you should or should not agree on something in a negotiation depends entirely upon the attractiveness to you of the best available alternative” write Fisher et al. (1991, page). This gave birth to the acronym BATNA (best alternative to no agreement). Having a good alternative to no agreement means there is no sense in agreeing to a deal or price that is worse than what you would get elsewhere. In most cases, that would represent your bottom line.

Robinson et al. (2000) detail how a traditional competitive bargaining tactic might entail not

disclosing your walkaway, your bottom line or the lowest or highest point you will possibly go. The objective of this approach is to create the widest possible profit margin. However, if you have a very good BATNA, general negotiation consensus says you should share it to ameliorate your negotiating position (Killerby 2014).

In the scenario where a manager wants to book his/her artist with a presenter, the manager may be incentivized to conceal the bottom line (a line that is customarily agreed upon with the artist beforehand) or represent a BATNA that is fictional or exaggerated. Such a BATNA might suggest direct conflict ("The artist has another opportunity that we are considering which pays much better") or exaggerated inconvenience ("The artist will be playing a very lucrative private event on the other side of the world").

A manager may look at this through the lens of duty, taking the position that in considering the obligations the manager has with the artist, an exaggerated or fictional BATNA is a necessary mechanism to get the best deal for the artist. He may take the position that his duty and first obligation is to his artist.

A consequentialist may see no fault in a fabricated BATNA as the ramifications of this tactic result only in either the artist getting a more attractive deal or negotiations ending with a presenter who was not going to meet the requirements anyway.

An individual may feel vindication in this approach through the lens of social contract ethics. They may say that such tactics are customary in the field. They may consider this as a more compelling way of communicating one's needs and be at a disadvantage if there is no indicator their artist is highly valued elsewhere.

Personalistic ethics may simply not think this is a problem when there are significantly bigger issues in the world at large. Personalistic ethics may also rationalize the position through a combination of the above three lenses.

### **Manager and Artist**

Though there are managers who handle the careers of one client exclusively, it is more often the case that they work with a roster of artists.

Where managers have a roster larger than one artist, they are often motivated to have two artists appear on a concerts series. One of the charges of managers is to ensure the protection, well-being, and success of their artists.

If there is a scenario between a presenter taking one artist versus the possibility of taking two artists, the manager will always benefit. An ethical consideration arises when two artists of equal stature are offered 15–20% less than their expected fee had they been the sole artist engaged. For example, Artist A would expect \$20,000 per concert and Artist B likewise accepts offers to perform at \$20,000. If the manager can only have one artist on the series, the most this manager would gain is a percentage of \$20,000. However, if he were able to work out a deal where the negotiated fee is only \$15,000 per artist, guaranteeing two artists being booked, he takes a percentage of a cumulative \$30,000. The result is that the manager would benefit where the artists would not. The artists, because of information asymmetry, may accept the agreement and unwittingly lose \$4000 (after 20% commission fees) while the manager gains \$2000 above what he would have received from one artist's expected fee. In this scenario, the first artist is financially worse off.

Information asymmetry between artist and manager happens when the artist, having handed over responsibility for negotiations to their agent, is not privy to much of the discussions and information that factor into a decision. In the scenario with two artists of equal stature taking a significant cut in fee to play on a series, a manager may present this as the best possible situation (saying this is the best offer possible or presenting the series in a more positive light than reality). The artist might interpret this only with the lens of a singular stream of consideration, not knowing the manager is highly incentivized to have the artist accept this position.

When considering duty ethics, a manager may perceive the situation as one of duty to the management agency: What is good for the company administering the careers of its artists is good for everyone (including the artists).

When considering consequence ethics, the manager may feel this is the fair cost for being part of an exclusive roster of artists. Where the second artist would not have been able to have a concert, the manager's defense may be that the year offers many opportunities where the "first artist" (who loses out on his expected fee) would benefit from being the "second artist."

Social contract ethics would say this is part of the industry reality. They would not see their actions as having taken advantage of information asymmetry.

Personalistic ethics may have the manager rationalize these actions with a personal conviction that one is creating more opportunities. In combining duty and consequence ethics, the manager may say it is his duty to benefit both artist and market. Where the manager may see his role as enabling a concert at all, instead of one artist being awarded a \$20,000 concert, he has in fact provided two artists with a respectable itinerary.

### Presenter and Artist

Renowned venues and presenters are particularly sought after, especially in the dynamic where artists are still establishing themselves. Many artists have a very low BATNA in this case because the value of appearing within this venue or for this presenter is something that has recurring value on one's professional vitae. Some perform for a very low fee or even for free.

Is it ethical for a venue or presenter to offer little to nothing, knowing it has the advantage in negotiations? On one hand, a presenter may see this as an award and therefore feel no further obligation.

Justifying this position from the lens of duty ethics, early career artists are getting significant compensation in the form of visibility, as well as an introduction to media and wide audiences. The presenter may say their "rule" is not to pay these artists because of the risk they are introducing to their ticket sales and reputation.

Framing the scenario by consequence ethics, the presenter may rationalize the end result. This

young artist, who may not otherwise sustain a break in the industry, will have access to the platform of credibility afforded by the association with the venue or series. They may discount the immediate and sustained value of the exposure against a hypothetical fee.

Looking at the ethics through the lens of social contract would find support from the myriad instances of this practice. In fact, discussion of exposure and payment issues has made the rounds in social media in recent years, which has brought an awareness of venues and presenters taking advantage of the value of market exposure and experience. The tides may shift on this being a solid practice because of these conversations.

Personalistic ethics may see a combination of the above three positional lenses; however, an individual's rationalization is affected largely by their decisions, the value of market exposure, and compensation.

Throughout these scenarios, each party plays a part in the ethical dilemma. The artist must also consider whether to accept the terms of low or no payment. Within the lens of consequence ethics, just as citizens of the world play a part in the cleanliness and sustainability of our global environment, an artist may reason that doing so is good for the industry. However, if an artist accepts a fee lower than their market worth, the presenter's incentive to pay another artist who is less established will be even lower.

### Conclusion

Three different negotiation scenarios have been considered using four different ethical frameworks: duty, consequence, social contract, and personalistic. Of course, many more scenarios exist within the classical arts. The decisions and negotiations that take place here highlight the importance of ethics in the dynamics of the classical arts marketplace.

Creating value from the differences that present themselves in negotiation is one of the key tenets of good negotiation (Lewicki et al. 2011).

Understanding different interests is certainly valuable, but understanding the ethical positions, values, and rationalization of your counterpart may prove even more valuable. Furthermore, the value of looking at any situation through the eyes of another who may hold different ethical grounds may lead to a strong market and amelioration of both existing and future careers in the classical arts industry.

## Ethical Decision-Making and Leadership Stress

## Introduction

The theme of this entry is how ethical decision-making is influenced by leadership stress. From a traditional point of view, stress is seen as a potential threat to leaders' ethical decisions (Selart and Johansen 2011). There is substantial evidence suggesting that stress has a negative impact on leaders' cognition and information processing, leading to errors and biases in their decision-making. However, it must be pointed out that in many types of professions (e.g., chief pilots, chief surgeons, and chief fire officers) leaders are more or less bound to develop advanced levels of stress tolerance in order to function ethically. This implies that stress does not always have to result in unethical decisions among leaders (Klein 1996).

The structure of this entry is organized such that its first part is devoted to clarification of the relationship between ethical decision-making and leadership, while the second part is focused on how stress adds to this relationship.

## The Relationship Between Ethical Decision-Making and Leadership

Ethical decision-making in leadership is to a large extent focused on the process by which leaders recognize and respond to ethical dilemmas. As a consequence, when leaders demonstrate certain kinds of decision behaviors, they are often seen as moral persons. However, research reveals that leaders who look upon

themselves as moral persons are more likely to make ethical decisions rather than others. A leader that self-identifies as ethical will therefore normally have a higher degree of moral awareness, or the capacity to recognize the ethical dimension of a decision. Such a moral leader has a natural ability to take into account relevant ethical aspects of a decision or recognize what ethical issues are in need of further consideration (Detert et al. 2008). A consequence of this is that a leader's moral normally has an impact on how alternatives are selected in the decision-making process. This requires that a leader with a high moral awareness is able to recognize biases that lead to unethical outcomes and hence avoid those. This is important since biases or judgment errors are found to be the major sources for unethical behavior (Kish-Gephart et al. 2010). Nevertheless, recent research reveals that a leader sometimes needs more than a strong moral character in order to be able to make ethical decisions in uncertain and ambiguous contexts. Skills based on professional experience are thus needed in order to make the necessary sense-making required in ethical dilemmas.

### How Stress Impacts the Relationship

There is much research suggesting a strong connection between stress and ethical decision-making among leaders. For instance, it has been found that ethical decision-making is negatively affected by time pressure and stress (Svenson and Maule 1993) and that almost half of all leaders report performance of unethical and illegal activities due to job pressure (Selart and Johansen 2011). Among leaders, high levels of stress may cause a breakdown in perceptual accuracy and an inability to focus on relevant environmental information (Keinan 1987; Christensen and Kohls 2003). Moreover, stress has been found to deplete leaders' attentional resources (Chajut and Algom 2003; Ganster 2005), and progressively reduce the range of cues utilized in a task. Several studies also suggest that stress impairs leaders' memory-retrieval. There are also findings indicating that stress have a negative impact on leaders' ability

to gather information, which impairs their capacity for using their working memory. In addition, stress makes it generally harder for leaders to concentrate on a current task (Christensen and Kohls 2003). Recent findings indicate that while stress sometimes has little influence on leaders' recognition of moral issues, it generally shows a negative effect on the establishment of moral intent (Selart and Johansen 2011).

However, there is also research proposing a connection between leaders' stress tolerance and their ability to avoid errors. High stress tolerance has, for instance, proved very helpful to leaders when they are trying to adapt to hectic environments, long hours, and organizational requirements. There is also research indicating that stress does not necessarily lead to unethical decisions (Klein 1996). Some categories of leaders must be able to work under constant stress to be able to fulfill their tasks, such as chief pilots, chief surgeons, and chief fire officers. Moreover, it has been found that leaders holding powerful positions in organizations most often reveal a high degree of stress tolerance due to perceived control (Sherman et al. 2012).

## Introduction

Ethical decision-making has been thoroughly studied in the scope of business ethics with the well-intentioned aim of modeling the processes through which agents make moral decisions. According to Bartels, who first presented an ethical decision-making model: “a model represents an attempt to explain the nature and behavior of

some phenomenon, to show causes and effects in related variable” (Bartels 1967: 21). Thus, the aim pursued by researchers since more than five decades ago in designing ethical decision-making models has been to identify the factors that most influence individuals to carry out an ethical behavior when a moral dilemma is faced as well as to improve the general understanding on the different phases and steps in which any individual is involved prior to making a final (unethical/ethical) decision. This way, with such research on the antecedents and phases nurturing the ethical decision-making process, researchers have laid the foundations to better enable organizations to foster factors and design strategies facilitating ethical behavior occurrence in the workplace.

## The Proposition of Rest: The Four-Component Model of Moral Behavior

The first approach on ethical decision-making was conducted by renowned psychologist James Rest. As was stated by Rest (1986), moral decision-making is governed by four interrelated psychological components (cognitive structures/processes): **moral sensitivity**, **moral judgment**, **moral motivation**, and **moral character**, which must be developed for a moral behavior to take place.

**Moral sensitivity** refers to the perception of how one’s actions may affect other people, that is, the recognition of the moral aspects of the decision made. Rest (1986) highlights that moral sensitivity includes the application of imagination (for the construction of possible scenarios), empathy (putting oneself in someone else’s shoes), and other social skills. Moral sensitivity must be distinguished from two constructs related to the capacity to detect a moral dilemma: *moral awareness* and *moral attentiveness*. While moral awareness refers to the determination that a single action has moral content and must be considered from a moral outlook, moral attentiveness is the extent to which one perceives and takes morality into account in his/her experiences. As such, we can say that moral awareness goes into action *when an event is experienced*, moral sensitivity is the

*capacity to regularly reach moral awareness*, and moral attentiveness captures *a chronic tendency to perceive problems on a moral basis*.

The second component, that is, **moral judgment**, implies “figuring out what one ought to do and formulating a plan of action that applies the relevant moral standard or ideal (e.g., judging that one course of action is morally right and the alternatives are not right)” (Thoma et al. 1991: 659), and the third component, **moral motivation**, involves “evaluating how the various courses of action serve moral or nonmoral values and deciding which action a person actually will attempt to pursue” (Thoma et al. 1991: 659) – also construed as disposition/motivation to take the moral line of action. Finally, the last component is **moral character** that refers to carrying out the moral plan of action.

In general, Rest’s model assumes that the components of the model are interrelated to each other, that is, they do not present a unitary linear sequence. In words of Rest (1986), “it must be taken into account that a four-component model negates that moral action or moral behavior is the result of a single and unitary process. Although one process could interact with and influence the others, the four processes have different functions” (Rest 1986: 4). Therefore, according to this author, moral action is the product of each of these processes operating in combination and interaction. Rest (1986) uses the example that, in some cases, when the cost of the behavior is valued as very high (component 3), it affects the perception of the problem, which is thus regarded as less important (component 1), in order to avoid performing the costly behavior.

## Ethical Decision-Making Models in Organizations

The interest in ethical behaviors of people in organizations is a topic that has accompanied business research from their beginning. Beyond the mere concern for financial or economic scandals or a fair valuation of the workers and of the employment relationships, the analysis of the ethical behavior phenomenon began in the 1980s, with

the first ethical decision-making models contextualized in organizations mainly linked to the Marketing area: Bartels in 1967, Ferrell and Gresham in 1985, Ferrell, Gresham, and Fraedrich in 1989, Dubinsky and Loken in 1989, and Wotruba in 1990, among others. Table 1 shows a list of the main ethical decision-making models in organizations.

## The Ethical Decision-Making Process

Despite the existence of different ethical decision-making models, the consensus in the literature indicates that the process followed by a person before carrying out or performing a certain ethical/unethical behavior is in line with that which had been described by Jones in 1991. This model transforms the *four components* proposed by Rest (1986) into four consecutive phases, thus indicating that the individual facing a moral problem goes through four phases until performing a certain ethical behavior. The first phase is the perception of the moral problem, the second phase refers to the making of an ethical judgment in which one values the goodness or wickedness of each act, the third phase consists in the formulation of a moral intention (i.e., a commitment to a certain behavior), and lastly, in the last stage the decision/behavior is implemented. Each phase is explained in more detail below.

*Awareness:* Perceiving the moral problem is the first component of the model. In order for an ethical behavior to be carried out, the individual must perceive that there is a dilemma in which the moral component has been involved. According to Jones (1991), this involves the decision-maker’s perception of two aspects: (1) his/her behavior affects other people, that is, it can harm or help others, and (2) he/she can choose among several actions, that is, it is a voluntary component. Both characteristics of the problem make the individual recognize him/herself as a moral subject.

The adequate perception of the problem is fundamental for an adequate ethical decision-making process to take place, since the dilemma, when dealing with ethical issues, is not exclusively

about “choosing” but creating the choice, that is, constructing the problem correctly, which includes designing and selecting the alternatives (Bastons 2008). This selection of alternatives is part of the perception of the problem, since the problem will be defined based on the various existing behavioral alternatives.

The importance of perceiving the ethical problem led Tenbrunsel and Smith-Crowe (2008) to differentiate “when” the moral decision is made from either a moral framework or an amoral – for example, exclusively legal or economic – framework. If one does not perceive that the problem includes a moral component, he/she will be in an amoral decision process, even if it involves behaviors considered by society as immoral. In fact, this way of understanding the perception of the ethical problem implies incorporating the perspective of the subject who carries out the decision-making process. A behavior can be amoral from the point of view of the individual (who does not perceive that he/she is doing something dishonest), but immoral from the point of view of society (which considers that the individual should have been better informed or have considered the consequences of his/her actions). By differentiating between two possible actions (one conscious and the other thoughtless) at the beginning of the decision-making process, these authors highlight the importance of considering the perception of the ethical problem as a starting point – not as “a prerequisite that guarantees ethical decisions” (Tenbrunsel and Smith-Crowe 2008: 553) – as proposed by Rest (1986) and Jones (1991), among others. Such is the importance of this phase that there is responsibility in the capacity of each individual to perceive *when* there is a moral problem upon carrying out a certain behavior. To sum up, the awareness phase initiates the ethical decision-making process, and its aim is to perceive and design the moral dilemma, using all the tools available. The inappropriate exercise of this phase of the process will result in an unintended but unethical behavior.

The studies on the perception of the moral dilemma have generally used one of these two options (Treviño et al. 2006): These studies either consider moral perception directly as a function of

the *individual's moral sensitivity* or consider it as a function of several context-related factors (including the individual factors). In the studies that analyze the *individual's moral sensitivity* as a fundamental tool of moral perception, moral sensitivity is usually related to variables such as age, gender, job type, etc. On the other hand, in the studies that analyze context-related factors, the most studied factor is the *moral intensity* of the ethical problem, defined by Jones (1991: 372) as “a construct that captures the degree of moral intensity related to an issue in a certain situation. It is multidimensional, and its components parts are characteristics of the moral issue such as magnitude of consequences, social consensus, probability of effect, temporal immediacy, proximity, and concentration of effect.”

*Judgment:* The second phase of the ethical decision-making process consists in judging the goodness or wickedness of the behavior in question. There are many factors that affect the moral evaluation of actions, although it seems that the most influential ones are the conviction of the decision maker and moral intensity – the latter has already been described. Regarding the convictions of the decision maker, there are three main variables analyzed in the existing literature: (1) *cognitive moral development*, proposed by Kohlberg and incorporated to the ethical decision-making process designed by Treviño in his model in 1986 (see Table 1); (2) the individual's *theological* or *deontological* considerations, proposed in the model designed by Hunt and Vitell in 1986 (see Table 1); and (3) the variables of *idealism* and *relativism* proposed by Forsyth (1980). Moreover, numerous studies analyze ethical judgments as a function of certain demographic characteristics (age, sex, education level. . . , etc.), with the aim of drawing conclusions about which groups of people can make better valuations on moral problems.

This moral judgment can be either rational and reflective or intuitive and thoughtless. According to what was proposed in the models elaborated by McDevitt et al. in 2007 and Murphy and Dacin in 2011 (see Table 1), in the face of a moral dilemma, a first intuitive moral judgment may emerge. Subsequently, due to different reasons, a more

reflective moral judgment can be made based on the information obtained after a search process and an exhaustive analysis of the different alternatives that are evaluated according to certain moral rules. The reasons to make a more conscious and rational judgment may be: (1) the problem is very complex, (2) the judgment is not clear, or (3) there are pressures, incentives, or other external factors. The relationship between

intuitive and rational judgments is complex, since in the face of the immediate judgment of intuition, rational judgments can be affected by individual factors as well as by organizational pressures that introduce evaluative elements that are not exclusively ethical.

*Intention:* Intention is defined as “an individual’s readiness or willingness to engage in a particular action” (Kish-Gephart et al. 2010: 2). In

Rest's (1986) model, the third component is called "moral motivation"; however, in the meta-analysis conducted by Kish-Gephart and colleagues in 2010, these authors defend the conceptual similarity between this term proposed by Rest and that of "moral intention," which is widely recognized in the literature about ethical decision-making. Under this consideration, the third phase of the ethical decision-making process consists in generating a moral intention, which differs from moral judgment in that in this part of the process, other valuations made by the individual come into play, such as his/her personal interest, the damage that each action may cause, etc. In fact, a person can judge that a behavior is poorly ethical, and yet generate the intention to carry it out and vice versa.

*Behavior:* Most of the articles focused on business ethics from a descriptive approach omit the definition of ethical behavior; they do not specify the definition of ethical behavior (Tenbrunsel and Smith-Crowe 2008). In fact, of the theoretical articles that propose an ethical decision-making model, only Jones (1991) and Bommer et al. (1987) define this (final) outcome of the process. For example, according to Jones: "an ethical decision is defined as a decision that is both legal and morally acceptable to the larger community. Conversely, an unethical decision is either illegal or morally unacceptable to the larger community" (Jones 1991: 367). Bommer et al. (1987: 267) also identified ethical behaviors as "those behaviors the correctness of which constitutes the moral intuition in businesses and the professions." Anyway, several definitions have been proposed in the literature, with Treviño et al. (2006: 952) conceptualizing it as the "individual behavior that is subject to or judged according to generally accepted moral norms of behavior."

### Factors That Affect the Ethical Decision-Making Process

From the beginning of the process, and during the time one takes to make his/her unethical/ethical decision, different factors are argued to affect the four phases of this process (for more details, see

Kish-Gephart et al. 2010; Treviño et al. 2006). The theoretical contributions made to date have allowed the consideration of a large number of influential variables in the whole process, which, in addition, have been tested to determine their relationship (strong, weak or none) with one's ethical behavior. These variables can be grouped in three categories: individual factors, organizational factors, and factors related to the perception of the moral problem.

With respect to the individual factors that affect the ethical decision-making process, researchers have attempted to identify those that better predict one's unethical/ethical behavior. The studies that analyze these factors have approached both their influence on the entire decision-making process and their effects on each specific components of the process. Researchers have focused mainly on demographic, psychological, cognitive, and emotional factors. Organizational factors also have great influence on moral decisions and ethical behaviors: ethical culture of the organization, obedience to authority, structure of rewards and punishments, workplace context, codes of conduct, policies and rules of the company or institution in which one works, influence of the leaders, and structure of the organization. Lastly, the factors related to the perception of the moral problem are mainly comprised in moral intensity, which is "a construct that captures the extent of issue-related moral imperative in a situation" (Jones 1991: 372). This construct is composed of six dimensions: (1) magnitude of the consequences (sum of the harms/benefits of the action towards the victims/beneficiaries), (2) social consensus that an act is good or evil, (3) probability of the effect (probability that the action will provoke harm/benefits to others), (4) temporal immediacy ("how long" the effects of the act are apparent), (5) proximity (physical, psychological, and social nearness with the victims or beneficiaries of the action, and (6) concentration of the effects (number of the persons affected by the action), and this construct affects all the phases of the ethical decision-making process, since the individual perceived the moral dilemma to when he/she performs his/her unethical/ethical behavior (Jones 1991). Currently, the analysis on how one

E

ends up performing an unethical or an ethical decision/behavior follows the structure and step-by-step process that is described in Fig. 1.

## Conclusions

In the literature on business ethics, a large number of studies have showed the processes and factors that lead an individual to carry out an unethical behavior within organizations. Therefore, the positive analysis of moral actions aims to show *which* factors affect the ethical behavior and *how* such factors interact with each other (the process). This analysis deciphers that the dependent variable is moral behavior, defined as that kind of behavior which is in agreement with certain behavioral standards that are considered good. This analysis

also indicates that the independent variables can be grouped, in general terms, in three principal categories: personal variables, organizational variables, and variables related to the moral issue faced by the individual.

To understand how the ethical decision-making process is carried out, a deep reflection about the nature of the individual must be done. It is also important to note that although the behavior performed by a person can be a great source of information about the result of the process, such information does not always provide data to understand how the behavior was developed. Two persons may act in the same way for absolutely different reasons: same behavior, different application of the process.

Some of the problems encountered in the search for a unified and consistent ethical

decision-making model emerge from the vagueness of the components of the moral action. The key is to understand that ethical decision-making is a process in which three elements converge: the action, the person who performs it, and the circumstances under which the action is performed. Moreover, the definition of ethical behavior refers to a set of rules with which we can compare such behavior. We thus must reflect on “which” these reference rules are and “where” they emerge, such that a behavior is ethical or unethical depending on (1) the behavior itself and the perception of the person who performs it and/or on (2) a set of reference rules on which such behavior is evaluated.

In all, the variables that affect the process and, thus, the (ethical) decision/behavior ultimately performed are in line with what McDevitt et al. argue in 2007, both individual and organizational. Also one cannot ignore that the morality of an action emerges from the interaction of certain characteristics of the person (intention and knowledge), the characteristics of the moral action itself, and the circumstances around the decision.

## Ethical Dilemmas

## Synonyms

Caught between Scylla and Charybdis; Trapped between a rock and a hard place; Truly on the horns of a dilemma

## Definition

A dilemma is defined as “a situation in which a difficult choice has to be made between two (or more) equally undesirable things or course of action.” A dilemma is “a state of indecision between two or more unpleasant alternatives” ([Oxford Dictionaries](#)).

## Introduction

A moral dilemma concerns situations in which one is morally obliged to act and, at the same time, to refrain from acting due to another obligation. It may be that we are required to act to

achieve a certain end but that the side effects render the action unacceptable (Wempe and Donaldson 2004). In a moral dilemma, we have to cope with conflicting moral obligations or conflicting underlying moral values.

Dilemmas play an important role in ethics. They particularly occur when we want to translate ethical theory into practice. Theory often starts with ideal situations in which a problem is optimally framed. In everyday situations, however, there are often multiple obligations and unintended counter-effects at stake. Multiple conflicting values have to be included in the considerations. A choice in favor of one value often implies that no or insufficient justice is given to the conflicting value(s).

A choice between a good and a bad action is not a difficult choice and therefore lacks a moral dilemma. With such a choice, it is clear what you are supposed to do. In a true moral dilemma, a tough choice between obligations or values has to be made. Every choice that is made implies favoring one value over another. A dilemma has been described as a difficult choice between “right and right” (Badaracco 1997). In such situations, it is emphasized that a certain value has to be chosen (something that is right) and that this is not a rejection of the conflicting value.

A moral dilemma concerns a choice between two or more possible actions where:

1. There is a moral value behind every possible action.
2. The choice for one of the options implies acting in conflict with the moral values that lie behind the alternative possibilities of action.
3. There is a necessity to act and therefore a need to choose between the values at stake. Nonacting also implies a choice.

A dilemma should be distinguished from a paradox. A paradox is a *seemingly* unbridgeable contradiction. However, the conflict between the possible actions and values is only apparent: a paradox can be solved by thinking through the issue.

## Dilemmas in Business and Professional Ethics

Dilemmas play a major role in business ethics and professional ethics. In business ethics, attention has been given to dilemmas through the introduction of the concept of stakeholders (Freeman 1984). Nowadays, companies are seen as organizations in which a multitude of parties have a “stake,” and the problem arises as to how their often conflicting and legitimate expectations should be weighed against each other. Stakeholder management is therefore essentially moral in nature: it is about making responsible choices. Dilemmas are thus directly linked to day-to-day decision-making by managers within companies.

Dilemmas also play a major role in professional ethics. Within each profession, there are dilemmas inherent to that profession. Many dilemmas occur in the medical sector. Doctors have to act in the interests of their patients but also have to take account of the affordability of healthcare and, for example, the health of other people when a contagious disease is detected. The care of the patient can be at odds with the social obligations of the physician. Training courses for professionals often entail forms of ethical training. In these programs, dilemmas are often used. On the basis of such dilemmas, professionals investigate how moral decision-making should take place according to the standards of the profession.

## Examples

A number of model examples of dilemmas have been developed in the literature for heuristic purposes and for educational programs. A classic example is Sophocles’ *Antigone* (Sophocles 1986). In this tragedy, Antigone must choose between her conscience and the laws of the state, between obeying the laws of the gods (universal laws) and obeying the laws of the king (the secular authority). This dilemma is a model for the more recently prominent issues of civil disobedience (Wiltshire 1976)

and the dilemma facing the whistle-blower (Contu 2014). Within developmental psychology, the Heinz Dilemma is a classic example. Heinz wonders whether he should break into the premises of a pharmacist who has developed a drug that will cure his seriously ill wife but is too expensive for Heinz to purchase. Kohlberg uses this dilemma to show the different stages in moral reasoning seen in children. At every stage of their development, children use different types of moral argumentation (Kohlberg 1981). Another dilemma that is used in many ethics courses is the Trolley Dilemma. Here, the solidity of utilitarianism is put to the test (Thomson 1985). In one of the variants of the Trolley Dilemma, a passer-by is confronted with a Trolleybus running downhill and no longer under the control of the driver. The bystander who sees this by chance then faces the choice of sacrificing the life of one person to save five other lives. A dilemma that has been extensively analyzed in the context of game theory is the Prisoner's Dilemma. This dilemma forms a model for many social dilemmas. The Prisoner's Dilemma shows that people who fail to communicate make decisions and are driven to act in their own interests, and are unable to realize an optimal situation for everyone (Poundstone 1992).

## Dilemmas in Theory and Practice

Ethics in organizations and in professions are often shaped by establishing the moral principles of that organization or that profession in a code of conduct (Kaptein 2008). Such a code describes a number of rules of behavior that prescribe how employees should behave in concrete situations. However, rules often misinterpret the complexity of situations that occurs in everyday practice. In management practice or the practice of a profession, there are often multiple principles that may conflict with each other.

The question remains, however, whether genuine dilemmas exist. Are we really faced with conflicting moral obligations that cannot be realized at the same time, and where the

realization of the one offers no excuse for neglecting the other, or is it a case of difficult issues where we simply have to think through the situation more deeply in order to judge which action deserves priority? One argument against the existence of true dilemmas is that such situations would amount to a logical inconsistency. On the one hand, obligations have to be honored, on the other, "ought implies can." We are not bound by impossibilities (McConnell 1987). A second argument that is often advanced against the existence of true dilemmas concerns the unacceptable consequences of accepting their existence: to do so would undermine all ethics. According to the critics, we should hold on to the ideal of coherence, as without it ethical reflection is meaningless or even impossible (Wempe and Donaldson 2004).

We argue that, on the one hand, different norms and values apply that cannot be reduced to a single measure. On the other hand, ethical reflection requires rational decision-making. If the choice of a given criterion is ultimately arbitrary, both the meaning and possibility of ethics are undermined (Wempe and Donaldson 2004). From a theoretical perspective, it is difficult to understand dilemmas. In everyday practice, however, a pressing need is felt to understand dilemmas. As McConnell observes, "Common sense and ordinary moral discourse are on the side of the friends of dilemmas" (McConnell 1996, p. 37).

An interest in dilemmas arises when we are confronted with translating moral principles into practice. Then the question arises how, in the decision-making process, the conflicting values should be weighed against each other. In this context, it is important to recognize the difference between values and behavioral obligations. Values describe what should be seen as valuable. Values constitute a reason to act in a certain way. As such, value offers a basis for rationality (Bouwmeester 2017). Conflicting values can co-exist and remain of value even when, under pressure to choose, one opts to honor one value and ignore the other values. This does not mean that the nonhonored values are inherently less important. This is why many organizations

choose to organize dilemma training as an instrument to learn how to work with a code of conduct.

Thinking in terms of dilemmas implies a vision on the status of morality and an ability to reflect upon it. In theoretical situations, it is possible to assess a certain action separately from its context. In such situations, it is possible to use one principle to assess the action or situation. Such an approach is based on a monistic ethic: that there is one principle that is decisive in assessing an action or situation as right or wrong. The recognition of the existence of genuine dilemmas is that, in practice, the situation is often more complex and that multiple values can simultaneously apply. This presupposes a pluralistic ethics (Walzer 1983; Badaracco 1997).

## Source of Dilemmas

It is possible to recognize a number of causes for dilemmas emerging.

An important cause of dilemmas can be found in the cooperation among people in the context of an organization. When people start working together and form an organization, three types of dilemmas arise: the Dirty Hands, the Many Hands, and the Entangled Hands (Kaptein and Wempe 2002).

The Dirty Hands Dilemma concerns the tension between the organization's goal, which is usually understood in utilitarian terms, and the obligation to respect rights and to act justly. The Dirty Hands Dilemma questions whether realizing the organizational goal justifies acting in violation of justice and rights.

The dilemma of the Many Hands concerns the tension between individual and collective responsibility. An effective and efficient organization offers individuals the opportunity to hide behind organizational responsibility. If a corporation acts irresponsibly, the collective moral responsibility can become diffused in that it gets lost among the individual responsibilities of employees. The Many Hands Dilemma can arise in organizations in different ways. First, multiple

employees may have separate, uncoordinated perspectives on the corporate objectives and responsibilities. Each of them feels responsible for the organization and the future of the organization. The Many Hands Dilemma can also be trimmed when responsibilities are shirked and stakeholders are left with no one to turn to. In such instances, no one is willing to take on the task because they are unauthorized or lack the necessary competence. When employees only feel responsible for their own tasks, the bigger picture simply fades away.

The Entangled Hands Dilemma arises because people who start to act in an organized context inevitably have to deal with multiple roles. This leads to the possibility of role conflicts. Each role implies moral obligations and the dilemma concerns the question of which responsibility should prevail.

As soon as people start working together in a form of organization, these three types of dilemmas will arise (Kaptein and Wempe 2002).

Functioning as a professional can also lead to dilemmas. Professional ethics requires certain behavior, but other human or social obligations can conflict with this. A doctor has a duty of confidentiality, but what should doctors do when they have knowledge of a possible crime that they could prevent?

## The Solution to Dilemmas

Although it is sometimes possible to resolve a dilemma by prioritizing all the relevant duties involved insofar as some are *prima facie* stronger than others (Ross 1930), this is often impossible. Practical hurdles can make it impossible to prioritize. Perhaps there is an order of priorities or there are good reasons to make trade-offs, but we lack sufficient knowledge, insight, information, and analytical skills to successfully make such trade-offs (McConnell 1987). In that instance, we could try to resolve these dilemmas with further research to fill the gaps in our knowledge and insight. In such a situation, it would be wrong to talk of a genuine dilemma.

It can also be impossible to come to a rational decision because the values, norms, and ideals at stake cannot be compared.

When it is not possible to come to a rational decision between conflicting values, ethics must be seen as making a choice. The choice depends on the person or organization that you are, or would like to be. According to Badaracco (1997), you develop your identity as a person by the choices you make. In this context, he speaks about “defining moments,” identity-determining choices. He sees this as applying not only to individuals but also to an organization and even to a society. These, too, face identity-determining choices.

A possible solution to dilemmas can be found in recognizing a broader and richer concept of rationality that may underlie decision-making within the organization (Bouwmeester 2017).

When dilemmas can only be “solved” by making a decision, cutting the Gordian knot, the integrity of the decision-maker is often invoked. Then, we try to locate the morality of a decision in the character of the leader: the manager. Managers should be unbiased, have no interest in the outcome of the decision, and be transparent. It is also possible to embed integrity in the structure and culture of the organization (Kaptein and Wempe 2002).

## Conclusions

Dilemmas challenge ethics. If you accept that genuine dilemmas exist, you may end up with a sliding scale, and relativism may be a logical consequence. Nevertheless, recognizing dilemmas is of great importance when it comes to the application of ethics in practice.

### Introduction

In the aftermath of a number of scandals, such as Guinness, Maxwell, WorldCom, and Enron, business conduct has generally become governed by statutes, codes of conduct, and regulatory authorities, while trust and generally accepted principles of proper conduct have disappeared. Although there have been many cases of disgraced directors and accountants, there have been none involving a chartered secretary, which may be seen as the result of an effective code of professional ethics. A code of ethics outlining the responsibilities of and best practice for an individual or organization has become one of the mandatory disciplines of a professional body. Codes of ethics, ethical policies, or codes of conduct can be a means for establishing and articulating the values, responsibilities, obligations, and ambitions of an organization or profession (Fisher and Lovell 2006).

In reference to ethical conduct, Kakabadse et al. (2002) highlighted the incongruity between the desired values of the individual and the contextual realities of the organization, raising the paradox of what one should do and what one ought to do. Personal experience and the professional journals suggest that many professionals in senior administrative positions have, at some point in their careers, encountered such a paradox, causing a conflict between their professional

training and the needs of the business or the instructions of the board. The crucial point here is that although business ethics comprises principles and standards that guide behavior in the business world, occupants of corporate secretary roles experience ethical dilemmas. In their daily work, they need to discern what is right (or good) and what is wrong (or bad).

Fisher and Lovell (2006, p. 226) defined a dilemma as a “perplexing state involving difficult or unpleasant choices,” and Ferrell et al. (2002) explained an ethical dilemma as a problem or situation that requires a choice between actions that require evaluation as ethical or unethical. Whether a specific required behavior is acceptable is usually determined by the business stakeholders, and, although these may not necessarily be “right,” their judgment will tend to influence society’s acceptance or rejection of a business and its activities. A business ethical dilemma would, therefore, be a problem or situation that requires the business or the employee to choose between a number of actions that must be evaluated with regard to the needs and requirements of the stakeholders and the community.

Typical examples of ethical dilemmas can be seen with respect to secretaries who come to know of accounting fraud or corruption involving senior executives with whom they used to work closely. Other examples are not that easy to identify as unethical practices, especially when they comply with existing laws and regulations. Further, a new category of importance in the future is artificial intelligence (AI)-related ethics, a field currently evolving though largely yet untouched by laws.

### The Role of Corporate Secretaries in Corporate Governance

Governance has been described as the mortar holding together the brickwork of society. It stretches from local town or boroughs through to national and even international levels. Corporate governance is often described as a system by which all organizations are directed. However, there have been many definitions of the meaning of corporate governance. These range from ideas

of the processes by which companies are run to systems by which companies are directed and controlled. Perhaps the most generalist view is from Bain and Band (1997), who suggest that it is the relationship between various participants in determining the direction and performance of organizations. Overall, corporate governance can be viewed as the system by which all organizations are directed and controlled and is the upper level in the process that should ensure an organization achieves openness and integrity; it involves the rules, responsibilities, and accountability of senior management.

While in the USA corporate secretaries are exclusively lawyers, the UK Companies Act 2006 requires a corporate secretary to be a lawyer, a qualified accountant, or a chartered secretary. The practice of dual role of general counsel (GC) and company secretary has a potential for conflict of interest (Kakabadse et al. 2014). A dual role offers an opportunity for the GC to attend board meetings. However, a GC would attend those meetings in a different capacity to the company secretary and may be privy to discussions that conflict with the interests of the company. The GC usually reports to the chief executive and represents the company rather than the board, whereas the company secretary reports to the chairman and serves the board.

In the UK, all chartered secretaries, irrespective of country of residence, are members of the Institute of Chartered Secretaries and Administrators (ICSA), an international professional body with a Royal Charter. "They are high ranking professionals who are trained to uphold the highest standards of corporate governance, effective operations, compliance and administration" (ICSA 2006, p. 1). The corporate secretary in the UK is, by law, a servant of the company and of the board of directors and, as such, is answerable to the chairperson; however, the secretary also has to report to the managing director or another senior official of the company, usually as a result of a term in the contract of employment. He/she is criminally liable for defaults committed by the company, for example, failure to file any change in the details of the company's directors and secretary and the

company's annual return within the time allowed. Secretaries have always been the only persons to lose their appointment by law if the company appoints a liquidator.

The Companies Act 1985 imposed a number of duties on the secretary, which include the completion and signing of the annual return of the company, the signing of the director's report in the company's annual accounts, the completion and signing of various statutory forms, and the making of various applications and statutory declarations on behalf of the company. There are also the generally accepted normal duties of arranging, attending, and minuting meetings and maintaining the statutory registers. Company secretaries are the primary source of advice on the conduct of business particularly for a newly appointed director. The advice may vary from legal advice on conflicts of interest, through accounting advice, to the development of strategy/corporate compliance, and advice on environmental, social, and corporate governance (ESG) and sustainability aspects.

## Codes and Principles of Ethics

Although many, especially those in the medical profession, would cite the Hippocratic Oath as the first code for a professional body, the best preserved early written code of conduct, the Codex Hammurabi created by King Hammurabi of ancient Mesopotamia, actually dates from 1760 BC. Codes provide the members of the profession with guidelines for maintaining a professional attitude and a means of conducting themselves in a manner that will enhance their professional status. They provide guidance to members on how to handle situations that pose a dilemma between alternative courses of action. Just having a code, however, is not enough. It can only be effective when it influences everyday behavior, and this requires committed dissemination, implementation, and monitoring, which professional bodies continue to promote.

A survey by the accountants KPMG conducted in the USA in 2002 revealed that three-quarters of the respondents reported that they had witnessed

violations of the law or of ethical standards at work in the previous year (Fisher and Lovell 2003). This would be an endorsement of Tamminen and Leskinen's (1996) review, which showed that accounting is not only ethically loaded but that there is an abundance of ethical problems associated with accounting, partly because the population that they studied showed little concern for people outside the firm. Although there has been no similar review in connection with secretaryship, the similarity between the professions would allow one to assume the same influences.

The generalistic training of a chartered secretary has always been along deontological lines, following the belief that moral reasoning and action should always be guided by universal principles that hold true irrespective of the context in which an ethical dilemma might exist (Fisher and Lovell 2003). In the UK, this general training came into conflict with Thatcherism, which propounded a form of business natural selection or Darwinism with a *laissez-faire* approach, with everything being unrestricted and markets self-correcting in the long run (Daly and Mattila 2000).

Despite the fact that the secretaries of the companies involved in the various scandals exemplified by Guinness and Enron were never chartered secretaries, the profession came under the same increased pressure and scrutiny that was applied to other professions. Moreover, with changing business environments and technological advancements, the nature and controllability of new ethical dilemmas represent challenges for the corporate secretary.

## Varieties of Ethical Dilemmas

Coping with ethical dilemmas can be considered a key characteristic of the corporate secretary's function, involving a mix of commercial, regulatory, pragmatic, legal, and ethical decisions to be made (Kakabadse et al. 2014). The nature of the function involves the development of trusting personal relationships with the board but, at the same time, the demonstration of impartial judgment.

The closeness to the chairman and other senior executives can cause a dilemma for the secretary, especially in a dependency relationship, that is, when those in power can influence a secretary's employment conditions. In cases of non-compliance, misconduct, fraud, or when corruption and bribery are involved, it is a secretary's duty to take action. Cases are known in which company secretaries have ignored such misconduct and chosen not to speak out against it or be actively involved in it (CSJ 2017).

While the nature of ethical dilemma cases varies, typical cases in which company secretaries have failed their function involve corruption and fraud, as reported by the Hong Kong Institute of Chartered Secretaries. An entrepreneur and an accountant, for instance, with the help of a corporate secretary, offered bribes to acquire a share of the chairman's holding of a Hong Kong stock exchange-listed company. In return, the chairman agreed to acquire a mainland plantation project from an offshore firm owned by the entrepreneur (CSJ 2017). While this case is representative of an ethical dilemma that is rather easy to judge as it purposefully breaks laws and regulations and applies practices that undoubtedly can be regarded as unethical, other cases are not that easy to classify. Examples of the latter category relate to the debate about genetically modified crops and the Levi-Strauss Corporation's reaction to finding out that its jeans were being manufactured by underage Bangladeshi workers (Fisher and Lovell 2003). Genetically modified crops are subject to an ongoing debate with currently no consensus research among stakeholders involved, like consumers, businesses, farmers, and policymakers. Despite that fact, food containing modified genes is already on sale in the USA. One camp argues that genetically modified crops help to solve food shortages, while the other camp asserts there are risks to food security. Moreover, planting genetically modified crops could potentially harm biodiversity and increase antibiotic resistance or allergies, to name a few concerns. Although a promising area, in the absence of longitudinal studies, it cannot be claimed for certain that genetically modified crops are free of any risks to health and

environment. The latter dilemma of exploiting work conditions abroad is trickier to solve as multinational corporations (MNCs) have usually complied with local laws. Such laws, however, often lower standards to a level that workers are potentially exposed to situations dangerous to their health and lives. The dilemma can be seen, simplified, in the inability of hesitant local governments to impose laws protecting workers' safety, therewith raising costs for MNCs, and the standpoint of MNCs that this is solely a government task. However, since the MNC is in principle able to assess the risks and compare them with risks to workers' health in other (western) locations within its corporate network, corporate boards are in principle aware of and able to decide upon what level of safety standards they want to implement independent of how high (or low) governments set the bar. For the individual in the role of corporate secretary, an ethical dilemma may involve the need for "truth-telling" and suggesting unpopular approaches that may conflict with loyalty to the company or cause rising costs to the firm and, therefore, lower profit margins. Besides the aforementioned examples, there is a third category of ethical dilemmas evolving AI-related ethics.

### **Future Challenges for the Corporate Secretary**

Machines making decisions that affect our lives are a new area which, at the same time, represents a new category of ethical dilemmas. We currently see this type of ethical dilemma evolving in the area of AI. In this field, it is no longer humans who make decisions but algorithms. AI technologies are developing rapidly, and, with this development, questions arise about how machines will make ethical decisions. As ethical misconduct and dilemmas of the past have taught us, ethical dilemmas relevant to firms have two principal dimensions: the legal and the societal. Actions need to comply with laws as well as with societal expectations.

As algorithms, especially self-learning ones, have (likely) no conscience, how can they make

ethical decisions? Who can be legally prosecuted in case of misconduct, and how can laws be made effective to control behavior when they target machines that make their own decisions based on self-learning algorithms? These questions are relevant to the automotive industry today. The automotive industry is currently experiencing paradigmatic changes. Both automakers and policymakers are struggling with how to cope with the ethical dilemmas caused by autonomous vehicles. What would be an ethical decision by an autonomous vehicle about to crash in deciding who to save? A kid crossing the street while the lights are red or the two elderly drivers of the vehicles? Autonomous vehicles will have to decide who deserves to live and to die if a solution to save everyone is out of the question (Awad et al. 2018). While it will take some time before autonomous vehicles and related industries achieve commercial success, it is likely that legislation will develop in parallel to technological advancement and societal consensus on what is ethically acceptable and what is not. As companies need to balance profitable opportunities with harm to society, company secretaries dealing with phases of technological and societal transitions can hardly rely on laws alone.

There is a further challenge related to AI for the company secretary which relates to the position of the company secretary itself. While it is currently unclear exactly which jobs will be taken over by AI/digitalization, it is likely that "AI will abolish the repetitive and administrative tasks, which still form part of the corporate secretary's role" (CSSA 2018, p. 6). While this may reduce the workload of the company secretary, the function would still be needed to oversee and correct the work of an AI-operated system. The latter should not be seen as a threat but rather as an opportunity to further develop the role of the corporate secretary. With potentially fewer tasks, the role of the corporate secretary can include a stronger focus on ethical conduct within the board and beyond. Closer ties to external stakeholders can be developed, which focus on a firm's social responsibility. Closer ties can also be developed to the human resource (HR) function by mutually developing HR policies and guidelines for ethical conduct and

responsible leadership development. Though technologies may change the role of the corporate secretary, it will remain of central importance in corporate governance.

## Ethical Dimensions of Consumer Boycotts

Valentin Beck

Institute of Philosophy, Freie Universität Berlin, Berlin, Germany

## Synonyms

Boycott ethics; Ethical consumerism; Ethics of boycotting; Ethics of commercial boycotts; Ethics of consumer boycotts; Ethics of consumption

## Introduction

Consumer boycotts are a recurrent form of social protest. This entry sheds light on ethical issues and controversies concerning the practice, with the aim of contributing to a better understanding of its potential benefits and drawbacks. But first, a few conceptual clarifications are in order. What is a *boycott*? According to the *Oxford English Dictionary*, a boycott is a “[w]ithdrawal from social or commercial interaction or cooperation with a group, nation, person, etc., intended as a protest or punishment.” This broad understanding is consistent with the observation that boycotts are not restricted to the market sphere. The targets of boycotts – the *boycottees* – may also include individuals in the political realm, as well as other organized groups, including states and various nongovernmental organizations. The *boycotter* – the subject who withdraws from social or commercial interaction – may be one or more individuals or one or more organized groups. Finally, *acts of boycotting* – “withdrawal[s] from social or commercial interaction” – may take manifold

forms, ranging from silent withdrawal to publicly pronounced and highly visible social protests, such as demonstrations, sit-ins, mail-ins, call-ins, blockades (Friedman 2001, 236), online-petitions, and more or less organized calls for boycott on social media. *Political boycotts*, targeting states and their governments and citizens (Peled 2019), and *academic boycotts* (ibid.; De Shalit 2016), targeting universities and their members, raise a number of additional moral issues compared to *commercial boycotts* that target businesses. The two former types of boycotts more likely give rise to serious unintended negative consequences. They also make the consideration of a broader set of normative criteria necessary, compared to the class of commercial boycotts with which this entry is solely concerned.

## Individual and Organized Boycotts

*Individual consumer boycotts* that are not a response to public calls for boycott by an organized campaign do not seem to raise any special ethical problem. Individual consumption choices reflect and are often an expression of the diverse values, preferences, or tastes of consumers, who for various reasons – prudential, moral, or aesthetic – standardly refrain or “withdraw from a commercial interaction” with certain profit-oriented companies, or at least avoid buying some of their products. Consumers can also participate in so-called *buycotts* – the positive opposites of boycotts – by purchasing socially or environmentally certified goods, such as those with the *Fairtrade* label (Beck 2010). When it comes to the moral justifications of their individual market interactions, consumers can give preference to or abstain from certain kinds of purchases from a motivation to maintain their (moral) integrity by avoiding perceived complicity with objectionable business practices (Radzik 2017). Within such integrity-centered considerations, but also through a more general kind of moral reflection on their consumption habits, individuals can be guided by different kinds of moral reasoning, for example of a deontological, consequentialist, or virtue-ethical kind. Although *silent*

individual “withdrawal[s] from (...) commercial interaction” qualify as boycotts on the basis of the OED definition, it appears that they need not meet a high justificatory burden. Such purchasing decisions may be based on more or less defensible reasoning, but as long as these reasons are not publicized with the aim of promoting concerted collective action, or made in response to a public call for boycott with such an aim, individuals should enjoy liberty to choose what commercial interactions they enter, maintain, or exit (Beck 2019; Weinstock 2019). The case of *organized consumer boycotts* is categorically different, however. Legitimate grounds for silent individual boycotts do not equal legitimate grounds for participation in publicly advertised boycotts. The latter are much more likely to influence the behavior of business agents and even to coerce them into compliance, assuming they are effectively communicated to a wider public. This justifies a higher degree of scrutiny. Even more problematically, publicly advertised (calls for) organized commercial boycotts can unfairly inflict significant harms on their targets as well as on third parties (Radzik 2017; Beck 2019).

## Normative Standards for Organized Consumer Boycotts

Historically, some organized boycott campaigns have undoubtedly elicited positive social change, such as the legendary Montgomery bus boycott led by Martin Luther King in 1955–56, which was part of wider political struggles that spurred encompassing Civil Rights Reforms in the USA. Other boycott campaigns, however, are notorious for being based on reprehensible goals or principles, such as the government-led boycott of Jewish stores in Nazi Germany, which imposed a high level of intimidation and coercion on German Jews and amounted to a clear violation of their moral rights. Today, boycotts are often used to target large companies including multinational corporations, which have gained unprecedented influence in the global economy over the last few decades. Such protests seem *prima facie* justified if they are a targeted response to specific

corporate malpractices, such as disproportional greenhouse gas emissions, other kinds of environmental pollution, lack of minimum labor standards in the supply chain, gross mistreatment of animals, illegitimate lobbying, misinformation campaigns, collaboration or complicity with illegitimate political regimes, and systematic tax evasion and tax fraud. In the digital age, anyone can publicize a call for boycott with unprecedented ease. Many calls for boycott fail to capture sufficient public interest, however, while others are based on objectionable principles or goals or are poorly designed. This raises the question of how, when, and to what extent (calls for) boycotts are morally justified, and of the normative principles that boycotters themselves should comply with.

More and less restrictive normative principles have been proposed by moral and political philosophers. According to the “proto-legislative” account of Hussain (2012), ethical consumerism must respect the basic rights and liberties of those affected, be based on a reasonable conception of the common good, and should comply with principles of democratic representation. The last criterion is the most controversial. According to Hussain, it entails that boycotting campaigns may only deal with issues that have not been addressed in formal democratic processes and that they ought to be guided in a manner that is “appropriately representative” (ibid., 126). Other consumer ethicists have advocated more restrained principles for consumer campaigns. Barry and MacDonald (2018) advocate that ethical consumerism should be reflective of power disparities, sensitive of the views of those they seek to influence, and advance a reasonable conception of the common good.

The proto-legislative view’s requirements of democratic representation are indeed excessively strict and implausible for at least two reasons. First, it is unduly stringent to require consumer campaigns to restrict themselves to issues not yet addressed by democratically elected legislatures while the relevant institutions fall well short of the normative ideals on which they are founded. In our world, vast economic inequalities translate into inequalities in political influence, and thus continually undermine equal political

representation and participation. Businesses often also contribute to economic and political inequalities through lobbying that negatively impacts legislation and regulation. In societies that are economically just and more than nominally democratic, such political and economic inequalities would not exist, and boycotts might then be superfluous. But under the factual conditions encountered today, boycotts are a *prima facie* justified tool with which powerful corporate interests can be counterbalanced, provided they are used judiciously (Beck 2019). Second, even in a counterfactual scenario in which the ideal of equal political representation and participation were fully realized, there could be corporate malpractices that constituted legitimate targets for boycotts, even if they were supported by a qualified majority and backed by democratically enacted legislation. This especially concerns malpractices that violate animal rights or contribute to the destruction of the environment, as neither future people nor animals can defend their own interests even in societies which are ideally representative of their present human inhabitants (Beck 2019; Beck and Ladwig 2020). To conclude on this issue, although boycotters often rightly attempt to influence processes of public deliberation about legislative rule formation, they are in no way obliged to only run campaigns that are “proto-legislative” in the abovementioned sense nor do they have to be democratically representative.

### **Procedural Standards for Organized Consumer Boycotts**

It can be argued, however, that boycotting campaigns should comply with certain procedural standards, that is, with normative standards pertaining to the way these campaigns are conducted, additionally to resting on a reasonable conception of the common good that includes at least a commitment to the protection of intergenerational human rights, and perhaps also of animal rights. Considerations about the *fairness* and *efficacy* of single boycotting campaigns each point to the need for additional procedural

constraints. Fairness and efficacy concerns arise because the potential boycottees are businesses that operate in a competitive environment in which the malpractices in question can be typical of the relevant sector. It can therefore be argued that at least under such conditions, boycotts amount to scapegoating, because they unfairly single out a company for malpractice while sparing others whose behavior is similarly problematic or potentially worse. Moreover, such boycotts could be seen as ineffective on the assumption that targeting a single wrongdoer does not change the problematic patterns of behavior in the context in question. According to this objection, boycotts are at best a symbolic form of social protest and at worst have unintended adverse effects that run counter to the boycotters' ultimate goal. For example, an apparel company might respond to a boycott that highlights worker's rights violations in one of its facilities by selling the facility in question to a lesser-known competitor firm which continues the problematic practices. Similarly, a large fossil fuel company might finally decide to divest from coal in response to public pressure, after having earned a living off polluting the atmosphere for decades, by selling the relevant facilities to a smaller firm in the sector which operates outside the public spotlight.

By raising fairness and efficacy concerns, the scapegoat objection helpfully highlights the pitfalls which organized boycotts must avoid and indirectly points to the need to clarify the deeper purpose of this practice. It is certainly true that boycotting campaigns *can* be unfair or have counterproductive effects, by focusing on the wrong targets or by issuing the wrong kinds of demands. In each of the given examples, which are by no means far-fetched, the outcomes amount to "a 'microvictory' but a 'macrodefeat'" (Friedman 2001, 235). However, the scapegoat objection is not a knock-down argument to the practice of consumer boycotts in general, because these pitfalls can be avoided by adhering to certain procedural standards of proportionality and transparency (Beck 2019).

Starting with the former, it has been argued that boycotters should comply with demands of *proportionality*. They should ensure that their choice

of boycottee is legitimate by singling out corporate agents that engage in truly problematic malpractices, and by issuing concrete demands whose fulfillment will not have unintended adverse effects that would contradict the goals and principles of the boycott (*ibid.*). Complying with these demands of proportionality does not entail that boycotters must always target firms with the demonstrably worst behavior in their sectors. While the latter doubtlessly constitute apt targets, campaigners may lack access to comprehensive information that would allow comparisons between competing firms. Moreover, fairness concerns matter, but they are neither categorical nor absolute. The desideratum to treat competitors fairly can be outweighed by the need to publicize a malpractice and to prevent further wrongdoing. Complying with demands of proportionality means, however, that boycotters should not target above-average companies that are morally superior to their competitors. Such cases are different from those where boycotters target an average corporate wrongdoer, because the unfairness is considerably greater when the targeted firm's competitors are behaving much worse. Such boycotts are also more likely to cause adverse effects and signal to the industry that firms are being targeted arbitrarily. Targeting those who are doing significantly better in complying with justifiable normative demands would set the wrong incentives. As the fossil fuel divestment movement shows, targeting all firms of a sector can also be a smart way for boycotters to accommodate the requirements of proportionality, but such sector-encompassing boycotts may not always be feasible.

Next to demands of proportionality, boycotters should arguably also comply with a number of demands of *transparency*. First, campaigners ought to be transparent with respect to the factual observations and ethical standards on which their campaigns are based. They must provide the public with accurate information about corporate malpractices and avoid false accusations, explain how the targeted company can fulfil their demands, and communicate to the public how participation in the boycott avoids engendering significant adverse effects. Boycott organizers must also

make their own identity and agenda transparent. Imagine a profit-oriented firm seeking to undermine a competitor by using a campaign that is presented as “grassroots.” There would be a clear conflict of interest in such a case, since any negative publicity would serve the boycotter’s own economic interests. A rule that requires disclosure of identity and exclusion of conflicting interests would prevent such misuse of the boycotting strategy, and would facilitate consumer decisions about whether they want to participate in the boycott. It appears that these two sets of procedural requirements concerning proportionality and transparency are not only sensible guidelines for boycott organizers but also for ethically minded consumers who want to ensure they are not contributing to an illegitimate cause. Taken together, these considerations show how concerns about fairness and efficacy can in principle be accommodated with the introduction of procedural principles. They also highlight that there are a range of ethical questions beyond that of when to start a call for boycott against a company, namely the questions of how to organize a boycott and calibrate its demands, what to legitimately expect from the boycottee, and when best to end a campaign or the consumer participation in it. The latter aspects are as important as the first, but are still comparatively underexposed in the literature on the ethics of boycotting (Friedman 2001).

### Conclusion: Shunning or Strategic Tools for Change?

Organized consumer boycotts are one form of coordinated, collective action that aims at changing social behavior through a form of moderated coercion, by threatening and potentially following through on the withdrawal from certain market interactions. As such, organized boycotts need legitimization, by adhering to certain normative standards. The preceding considerations about substantive and procedural normative requirements for consumer boycotts follow from a view according to which boycotts should not be conducted as exercises in shunning, but as

pragmatic instruments for achieving lasting and positive social change. Instead of vilifying, banning, and indefinitely punishing single corporations, boycotters should aim to transform social and political structures and to shape corporate behavior in a lasting manner. If this is indeed their goal, then boycotters should adopt both pragmatism and forbearance toward corporate wrongdoers, with the aim to educate them and to incentivize norm compliance in the long-term. Although the shunning motif has been more extensively discussed in the literature on the ethics of boycotting (Mills 1996), it appears to play a comparatively minor role in the actual practice of consumer boycotts, which so far have mostly been treated as strategic tools to reach certain social goals (Friedman 2001). This predominance of the strategic justification for consumer boycotts may not be set in stone. It is to be hoped, however, that the discussion of ethical considerations of the consumer boycotts provided in this entry can explain why consumer boycotts have mostly been conducted in such a manner, and why sticking to this purpose might be in fact a good idea.

## Ethical Engagement: Observer Obstacles

Richard P. Nielsen

### Synonyms

Barriers to ethical action

### Definition

Obstacles to ethical observer engagement are barriers at the micro-individual, meso-organizational, and macro-environmental and institutional levels (Noonan 1984; Wood 1991; Nielsen 1996, 2003; Nielsen and Lockwood 2017) which impede ethical action.

The appropriateness of the ethics engagement methods depends on the types of individual, organizational, and environmental level obstacles to ethics engagement in the particular cases (Aldrich 1979; Nielsen 1996; Rose-Ackerman 1999; Collins 1998; Palmer 2012). When we understand that there are effective ethics engagement methods that observers can use and that are more and less appropriated for different types of

obstacles and situations, then this can help empower us as observers to realize our opportunities and duties to not just act ethically in our individual work lives but also to intervene and act ethically and together as networking citizens of our communities to effectively achieve ethical behaviors and build more ethical communities and resist both individual and systematic unethical behaviors. That is, practical knowledge of the obstacles and engagement methods can help empower ethical individual, organizational, and institutional character and culture (Nielsen 1996; Nielsen and Dufresne 2005) and reduce “normal organizational wrongdoing” (Palmer 2012).

## Microlevel Individual Obstacles

Weber (1952, 1904) constructed archetypes designed to reveal essential features of human behavior. Key individual archetypes that can be obstacles to ethics engagement by observers include the “Richard III,” the “Eichmann,” the “Socrates Jailer,” the “Faust,” the “Gorbachev,” the “Dr. Suguro,” the “Sophist,” and the “Phaedo” (Nielsen 1984, 1996).

The “Richard III” as Shakespeare characterized him was someone who said, believed, and acted according to “Evil be my good.” This person believes and acts for personal power and wealth objectives and serially disregards ethics and law. When this type of person is also a key and high-level manager or political official in an organization or crony capitalism system, they are able to greatly influence the executive, legislative, and judicial dimensions of organizations and government as well as much of banking and business and the media. Such people can be formidable obstacles to reform and ethical behavior. It has been suggested that Harvey Weinstein had this type of influence within Hollywood (Twohey et al. 2017) and that some key executives have this type of influence within Wall Street (Forsyth 2013; Gray 2016).

The “Eichmann” in history was an upper-middle-level Nazi administrator in WWII who organized the logistics of mass murder of some 15 million people to concentration camps

including 6 million Jews, 2 million Gypsies, and 7 million others including communists, socialists, the handicapped, and resisters to the Nazis in many countries (Arendt 1964; Nielsen 1984, 2014). Eichmann claimed that his only ethical duty was to “obey orders” from his legal superiors. Arendt (1964) famously referred to this type of behavior as “the banality of evil.” There appear to be many people to various degrees in corruption systems and organizations with serial wrongdoing who believe and act in this manner (Palmer 2012).

The “Socrates’ Jailer” was the jailer/executioner who gave Socrates the poison that killed him. Before he gave him the poison, he told Socrates that he knew that Socrates was ethical and innocent, but that he was afraid that the powerful people who condemned Socrates would kill him if he did not give Socrates the poison. So out of fear, he cooperated with the unethical killing of Socrates. While there are many people who benefit from and cooperate with unethical behaviors and corruption systems, there are also many who cooperate less out of desire for gain, but out of fear of being punished for engaging with unethical behaviors. They also help implement corruption and are necessary for the system to operate effectively.

The “Faust” archetype from Marlowe and Goethe is the character who sells his soul in exchange for good things – knowledge, love, and beauty. This person is cooperating with and helping the corruption and unethical behaviors for what the person believes is a good end that justifies a bad means. For example, this type of person claims that they are cooperating with the corruption and unethical behaviors not for themselves but for their families, their affinity group, their organizations, a high quality movie production or news program, and sometimes even their country. This end justifies the means phenomenon appears to have been common in the Hollywood Weinstein case where many aspiring actors in effect ignored the unethical behaviors for the sake of their artistic projects and careers and in Wall Street for the sake of their families’ financial prosperity.

Related to the “Faust” archetype is the “Gorbachev” archetype. In history, Gorbachev was the eighth and last formal leader of the Soviet Union. Gorbachev claims that for most of his life, he was against what he considered a corrupt, very low productivity, unethical, and unsustainable Soviet political-economic system. He apparently believed that change could only come from within, but he had to cooperate with the corruption so that he could eventually get to the top of the system in order to dismantle the system. He was an obstacle in the sense that in all those many years when his career was advancing, he was cooperating with the corruption and helping implement the corruption. He participated in the decisions to torture and kill many reformers and their families particularly during the latter years of and the years following the Stalinist period.

The Dr. Suguro archetype was a Japanese doctor who helped do medical experiments on and kill many civilian and military prisoners of war for the Japanese military during WWII. He explained that the reason he cooperated with what he believed was unethical behavior was because: if he did not do it, someone else would have and the end would have been the same, so he might as well cooperate. Similarly, many people living and working in unethical organizations and corruption systems similarly believe that if they don’t cooperate with the corruption and unethical behaviors, someone else will, so it does not matter in end who does it, so they might as well cooperate and benefit from the corruption and ignoring the unethical dimensions.

The “Sophist” archetype in history was in effect a political consultant who helped aspiring political leaders win and did not refuse such help if the candidate was not ethical, an apparently common phenomenon in Hollywood and Wall Street and many other places. What the Sophist cared about was “winning the game.” This is also a common phenomenon within unethical organizational cultures and corruption systems, where there are many people who believe that they were, in a sense, born into the game and did not design the game, but that given the reality and power of the game, it is better for them to win than lose while living within the game.

The “Phaedo” archetype is the person who does not know about or understand that unethical behavior and corruption in their specifics as they are going on, but when they do know and understand, are willing to engage and oppose the unethical behavior. The problem here is that a lot of people do not want to know when they are benefiting from the unethical behavior and corruption particularly when it involves family members and members of one’s social network.

### **Meso-level Organizational Obstacles**

At the meso-organizational level, there are four key subsystems that can hinder ethics engagement by observers: (1) an organizational culture that requires successful but corrupt adaptation to corruption systems; (2) recruiting, evaluation, and reward systems that support cooperation with corruption; (3) communication systems that exclude information about cooperation from ethics, compliance, and corporate social responsibility people in both local and home offices, a key problem in the 2008 US financial crisis; and (4) the use of agents and subcontractors who pay the corruption and political campaign contributions instead of direct payments by the transnational corporations (Ewing 1983, 1989; Nielsen 1983b, 2000, 2004, 2006a; Nielsen and Dufresne 2005).

### **When in Rome, Do as the Romans Do**

If the “Roman” political officials require business cooperation with crony capitalism systems and the ignoring of unethical behaviors and violation of financial regulations and ethics, then companies that adopt this “When in Rome” culture then comply. In a sense, the business leaders and managers lead dual, compartmentalized lives. That is, “when in Rome,” they pay the extortion in terms of cash and/or political campaign contributions and do other forms of cooperation such as hiring political appointees and making selected bad loans and bad refinances and ignore the sexual harassments, but back in their home environments and private lives where corruption is low and the culture is different, they behave differently.

Two, internal recruiting, evaluation, and compensation systems can also be a problem. That is, often companies with the “When in Rome” culture in their local operations intentionally recruit people with political connections to help the company do business. When the political system is corrupt, often the people recruited to effectively deal with corrupt systems are themselves part of that corruption. When they succeed in getting the business, no formal questions are asked or recorded about how they got the business. But since they did get the business, even if through unasked about and unrecorded unethical and illegal means, they are nonetheless promoted and rewarded.

This appears to have been at least partly the case in the Goldman Sachs case where one third of investors revolted and voted against bonuses for top managers when Goldman paid a fine of \$5.1 billion but had its stock appreciate much higher with the settlement and promise by Attorney General Horner not to criminally prosecute Wall Street executives and firms if it would negatively affect financial markets of not criminal charges (Forsyth 2013; Gray 2016). Unfortunately, two thirds of investors voted in favor of the bonuses.

Further, since the hiring of politically recommended people who are supporters of the corrupt political officials is normal in crony capitalist systems, there are ample people available within the organization to cooperate with and help cover up the corruption. In such organizational systems, a clear distinction is made between unethical and illegal behavior that makes money for the company through cooperation with the corruption systems and unethical and illegal behaviors that simply, for example, steal money from the organization (Palmer 2012).

Three, communication systems can systematically exclude information about corruption cooperation from ethics, compliance, and corporate social responsibility people in both local and home offices (Barone et al. 2013). This is a lot easier than it might appear. While there are often many ethics and corporate social responsibility programs, meetings and conversations about the real behaviors about the corruption cooperation

simply exclude from the conversations and meetings the official ethics, compliance, and CSR people. Such conversations are not recorded or passed along to headquarters offices who often know what is going on because they spent time in such local offices but have learned to not want to officially know. This was a common problem in the 2008 US financial crisis and a key explanation for why so many ethics and compliance officers played such insignificant and ineffective roles in detection and prevention.

Four, sometimes businesses use local agents and subcontractors who pay the extortion and political campaign contributions. These agents and subcontractors are often recommended by corrupt political officials and sometimes even required by local law. For example, lobbyists are advised to give legal business to the firms that relatives of politicians work for. This is one of the common methods politicians without inherited wealth and who earn salaries of less than \$300,000 can afford multiple \$6 million home purchases. At a larger level, a local law can require a 15% “set-aside” contracts for local contractors. If, for example, the primary contract for a missile system, a construction project, or a 7-year contract to supply the public health system with pharmaceutical products is worth \$3 billion, the 15% set-aside contract for the local subcontractors or purchasing commissions for the local agents can be worth \$450 million. A lot of extortion payments and political campaign contributions can be made from that \$450 million, and those payments are made from money and banks and even countries outside the company that paid for and received the \$3 billion contract.

## Macro-environmental Obstacles

The environmental factors that support continuing, longtime, and systematic unethical organizational and institutional cultures are (1) the nature of the political-economic system (Fine 2004; Davis 2009; Appelbaum et al. 2013; Nielsen 2008, 2010a, b, 2011, 2012), particularly “crony capitalism” system dimensions, and (2) competitive pressures. There are more factors,

and, depending on the particular case, other factors could be more important than the above two key environmental factors.

A key cause of systematic unethical behaviors is a type of political-economic system as well as system dimensions called “crony capitalism” (Noonan 1984; Beaud 1981; Heidenheimer and Johnston 2002; Nielsen 2006b, 2008, 2010a, b, 2011, 2012). When a crony capitalism system operates for many generations, unethical behaviors and corruption can also become characteristic of an industry and national culture. A crony capitalism system can include most of the political-economy or be a dimension of part of the political-economy. A crony capitalism system and dimension often include the following eight subsystem factors. Both Hollywood and Wall Street appear to have some of these characteristics.

1. Corrupt mainstream political parties. The main political parties together can control the crony capitalism system and take turns leading the government and the corruption as well as co-opting smaller reform parties and political leaders. When this is the case, members of such elites are often and in effect immune to any criminal prosecution or sanctions on their unethical behaviors related or unrelated such as sexual harassment and assault and financial fraud.

A key mechanism in this type of system appears to be massive financial contributions to the mainstream political parties and candidates. From the perspective of the business, money is contributed to both mainstream political parties so that the organization always has a potential “friend” in government if and when needed. As Attorney General Eric Holder (Forsyth 2013: 5) testified in justifying his decision not to criminally prosecute the top managers of any of the large financial institutions, “I am concerned that the size of some of these institutions becomes so large that it does become difficult for us to prosecute them when we are hit with indications that if you do prosecute, if you do bring a criminal charge, it

will have a negative impact on the national economy. . . .”

2. Large, corrupt public sector. In some countries, a large public sector can include normal government organizations as well as natural resources development organizations, state-owned enterprises including media organizations, sports organizations, financial institutions, and defense contracts that the corrupt political parties control.
3. Corrupt political allocation of resources to cronies (Nielsen 2003). In some countries, political officials assign most of the purchasing contracts of the public sector organizations, including normal government organizations and state-owned enterprises such as state-owned banks, media and telecommunications companies, power companies, and state-owned enterprises, to their cronies who own or control the businesses supplying the government organizations regardless of their systematic unethical behaviors. This includes assignment of broadcasting and natural resource development licenses and contracts. It also includes licenses to serve as purchasing agents of military and defense equipment sales and services. It further includes the political officials’ assignment and renewal of broadcasting television, radio, telephone, and social media licenses to their cronies. Newspaper and magazine print publication is included indirectly through the crony owners of the print media receiving government contracts though the cronies’ other businesses such as construction companies that receive government contracts to cover any losses in their media companies.
4. Corrupt, political control of debt financing. In some countries, the political officials require both the state-owned banks and private banks to make large and often intentional bad loans to the businesses the cronies own or control. The banks are also required to make larger refinancing loans to the cronies when they do not pay back the original loans. The banks are required to conceal the bad loans and minimize the classification of “non-performing loans.” The bankrupt companies that the cronies own
- are allowed to legally go bankrupt with no personal liability to the crony owners. The political officials appoint the top-level regulators, prosecutors, finance and economic ministers, and supreme court judges who allow and even encourage the bad lending cycles and abusive behaviors to continue with the help of state and international financial bailouts when the corruption gets too much larger than the productivity.
5. Massive extortion, financial, hiring, and promotion kickbacks to political officials. In some countries, in exchange for the contracts, licenses, loans, lower taxes, and other favors, the cronies then give kickbacks of 15–40% of the contracts and loans and political campaign contributions in the form of cash payments and investments to the government officials who assigned the businesses, arranged for the loans, the refinancing, bankruptcy protections, bailouts, and protections from prosecutions (Nielsen and Ballas 2000; Nielsen 2003). In addition, the cronies agree to hire and promote the people the political officials recommend in exchange for cash payments and sexual favors.
6. Massive international financial support of the crony capitalism. In some countries, the political officials arrange for international financial aid and large loans to the government and banks from other countries and regional organizations such as the European Union, the European Central Bank, and the International Monetary Fund, to, in name, stimulate economic development, but in large part to help finance the corruption. This international financial aid is particularly important for maintaining a stable crony capitalism corruption system when the corruption is higher than the productivity and the national economy itself becomes bankrupt.

There can be great variation among crony capitalism systems with respect to this ratio of productivity to corruption. For example, Greece has had both very high levels of corruption and low levels of productivity that has required massive amounts of international subsidization for more than 50 years. It is not that

the donor countries are not aware of the high corruption systems that they are supporting, but many believe such support is the lesser of evils compared to the risks of radical revolution or civil war within the high corruption and low productivity countries.

7. Corruption higher than productivity. Some countries like China have massive corruption and high productivity, but this is more the exception than the rule. There are also regions of countries such as Northern Italy where the high productivity has, until recently, outweighed the massive, systematic corruption of Central and Southern Italy. However, in most of the world's crony capitalism systems, corruption is higher than productivity, even in many high natural resources exporting states. When more money is available to be acquired through corruption systems than through productivity, then it can be very hard to change such systems and for countries to evolve into modern, high productivity, low corruption states such as is characteristic of the Northern European states.
8. History of foreign occupation and corruption. One of the key causes of corruption systems was colonization, foreign occupation, and exploitation of countries invaded and controlled for the primary benefit of the foreign power and at the expense of the occupied country. Modern Western European countries, for example, invaded, conquered, and ruled most of Latin America, Africa, India, Pakistan, Burma, Malaysia, Indonesia, Indochina, and the coastal areas of China for almost 200 years for the primary benefit of the Europeans and the exploitation of the countries they ruled. Not only did the Western Europeans operate their colonies in the traditional premodern sense of owning the land, but they also created near-monopoly markets for the manufactured goods of the countries who owned and controlled the colonial countries. The governments these foreign invaders installed operated the conquered territories for the primary benefit of the foreign owners and themselves. These were corrupt governments installed and kept in power by foreign invaders

who ruled through force, biased laws, and extortion. At one time, this represented most of the world's population and land. After independence and decolonization from the European and their US allies, the corruption system element as described above was inherited and adopted and was very similar to the seven points considered above. The political-economic system of "crony capitalism" is such a synthesis with the earlier modernist and premodern colonial systems. One of the reasons there is so much corruption in Southern and Eastern Europe is a similar, long-term history of colonial like occupation and/or control.

Competitive pressures in crony capitalist environments can also hinder corruption reform. When crony capitalism systems are operating effectively, as they are in much of the world, it can be very difficult if not impossible to do business in such countries and systems without cooperating with the systematic corruption. The reality is that if one company does not pay the extortion and contributions to the political parties or does not ignore the unethical behaviors, then the business and/or the permissions go to competitor companies. Since the legal system and the media are often also controlled by the corrupt political officials, this makes domestic legal recourse or domestic whistle-blowing exposure very difficult.

As the Siemens executives testified within Germany admitting that they paid hundreds of millions of Euros to Southern European political officials for their individual benefit and to help finance their political parties as well as in many other non-European countries, if Siemens did not make the extortion payments, then they could not do business in much of the world. There are some methods that can effectively overcome such competitive pressures. For example, whistle-blowing can be done through the media of the home country rather than in the crony capitalist country. For example, in the Siemens case where the whistle-blowing was done in Germany, German managers living in Germany lost their jobs and were prosecuted in Germany, and Siemens was forced to

change some of its corruption cooperation behaviors. However, nothing much has changed in the crony capitalist countries that extorted the payments from Siemens.

There are at least five sets of ethics engagement methods that observers can use to help achieve and maintain ethical institutions and communities and resist both systematic and individual corruption: (1) vision- and values-based methods, (2) win-win incentive and ethics networking methods, (3) power-based top-down compliance and bottom-up whistle-blowing methods, (4) support for alternative institution building, and (5) participation in social movement methods (Sharp 1973; Nielsen 1989, 1996; Nielsen and Bartunek 1996; Rose-Ackerman 1999; Trevino and Nelson 2003).

## Ethical Global Citizenship Education

## Introduction

Global citizenship education (GCE) has grown in popularity over the last two decades to assist students in developing their knowledge and understanding of a variety of local, national, and global issues. UNESCO’s definition of GCE (2015, p. 15) is one of the most often used: GCE is concerned with fostering “the knowledge, skills, values and attitudes that learners need to be able to contribute to a more inclusive, just and peaceful world.” Ethical GCE is a “reflective” educational framework that fosters ethical principles (e.g., fairness, equality, compassion, and integrity) and knowledge (Bosio and Schattle 2021). Ethical GCE develops students’ global understanding, self-awareness, cross-cultural compassion, a sense of accountability for achieving the common good at home and overseas, a readiness to speak out and become actively involved in efforts to address key issues of shared global concern, and human values, such as empathy and unity toward sustainability. Ethical GCE represents a pedagogical approach through which educators make a distinct commitment to students’ liberation of the human spirit toward critical and global justice concepts (Bosio 2021a, b; Giroux and Bosio 2021; Torres and Bosio 2020; Bosio and Torres 2019).

## The Five Dimensions of Ethical Global Citizenship Education

The concept of a “global ethic” informs and inspires ethical GCE. The notion of global ethic, when used in the context of ethical GCE, refers to all components of the learning/teaching process, as well as components of the student experience, which are divided into five dimensions: values-creation, identity progression, collective involvement, glocal disposition, and an intergenerational mindset (Fig. 1).

### Dimension 1: Values-Creation

The values-creation aspect of ethical GCE is associated with assisting students in developing authentic interconnections across the lives of

## Ethical Global Citizenship Education,

**Fig. 1** Ethical global citizenship education

various types of people based on *wisdom* (recognizing the interrelated nature of all human lives), *courage* (reflecting deeply on a personal level and recognizing one's own weaknesses and egotism), and *compassion* (having the ability to look beyond one's own immediate environment or cultural situations and empathize with other people's suffering). The values-creation element of ethical GCE is based on humanistic principles where educators encourage learners to establish "world-peace," albeit more peaceful societies, for example, by taking actions toward the gradual prohibition and abolition of nuclear weapons, in responding to the refugee crisis in ethical ways, and by constructing a culture of human rights. In this way, educators can foster in their students a sense of respect for the sanctity of life so that they can acknowledge the dignity of every human being (Bosio 2020).

### Dimension 2: Identity Progression

In ethical GCE, identity progression is referred to as the growth of human capability to be engaged

with and dedicated to values that express social responsibility in terms of attitudes, actions, and feelings. The "ethical global citizen" should be encouraged to commit to addressing issues and divergent opinions via critical reflective dialogue (Freire 1972), as well as being active in public life on local, national, and global scales. A feeling of ethical global citizenship may be developed by considering rights and responsibilities not only in terms of one's home country or town but also by viewing the globe as a single linked entity. This can lead to problem solving in various situations, one of which is the current requirement for a sense of global environmental citizenship in order to preserve the planet and its ecologies, reverse long-term environmental degradation, mitigate the threats of human-caused climate disruption and species extinction, and solidify Earth's capacity to sustain future generations. These values encourage people worldwide to commit to the types of ethical standards and conduct their lives in accordance with them.

### Dimension 3: Collective Involvement

While personal identification and personal convictions are vital, ethical GCE also contains a communal aspect that recognizes that action is required to promote these values in society and politics. An ethical global citizen should be able to participate in public discussions and focus on solving problems in a way that respects individuals with differing viewpoints, perspectives, and value systems – in numerous settings, be it local, national, or global. Social and political involvement is essential for ethical GCE. Dealing with twenty-first-century issues (such as COVID-19 pandemic, nuclear proliferation, cyberattacks, mass immigration, environmental destruction, and the global climate catastrophe) necessitates active citizen ethical engagement in every way. Ethical GCE must encourage tangible action as well as sustainable philosophy. It must provide sustainable suggestions or plans for the envisioned desirable society. In this regard, ethical GCE shifts from “good citizen” approaches to a more ethically focused strategy of caring for both the local and the global, which is referred to herewith as glocal. Ethical GCE supports learners to become active participants in their communities and nations’ social and political lives. Simple involvement, on the other hand, is insufficient. Action should be carried out in a meaningful and conscious manner that is fully respectful of the rights of others (Veugelers and Bosio 2021).

### Dimension 4: Glocal Disposition

A globally engaged citizen is a member of, and participant in, various communities, some of which overlap the following: local communities, regional communities, national communities, and international groups. Herewith, glocal citizenship refers to the diversity of values and mindsets that result from belonging and fulfilling obligations within these contexts. This perspective, which has implications for ethical GCE, has evolved from research in the social sciences and humanities contexts that suggest the world has become considerably more interconnected in recent generations and that this trend will

continue as the present century develops. Trade, immigration, communications, and technological transformations over the past decades have made it more possible than ever to consider the globe and its inhabitants as a single integrated unit.

### Dimension 5: Intergenerational Mindset

Fostering an intergenerational perspective within ethical GCE requires global citizens to recall and take into consideration insights from the past together with an awareness of future obligations that cross generations while confronting current global challenges (e.g., climate change, civil rights, racial discrimination, gender inequality, and health care availability). In this perspective, ethical GCE aims to assist learners in cultivating a deep awareness of their own and the world’s histories so that they may use lessons from the past while acting in the present. Furthermore, while customs and heritage describe a person’s own definition of citizenship, an ethical global citizen must consider and act with awareness of the consequences their current actions have for future generations. In order to avoid choosing ineffective short-term solutions, ethical GCE implies that efforts are made to address current issues and their implications for the present and the future.

### Practical Application

The five elements of ethical GCE broadly fall into three categories: *purpose* (i.e., values-creation), *relationships across self/others/communities* (i.e., identity progression, collective involvement, and glocal disposition), and *historical* (i.e., intergenerational mindset). Values-creation, for example, is more concerned with students’ capacity to cooperate meaningfully with, as well as accept accountability for, their respective roles within society, and their ability to create value in politics at the local, national, and worldwide levels. Identity progression, collective involvement, and glocal disposition are more focused on cultivating students’ inclusive and broad identities

(or selves), as well as individual participation in collective-sustainable activity. This concerns the aptitude to view and approach problems as a member of a glocal community, as well as a desire to understand, acknowledge, and accept cultural variations; a commitment to changing one's lifestyle and consumption behaviors to safeguard the environment; the inclination to address conflict without the use of violence; and the ability to reflect on a systematic and critical level – for instance, to be sensitive to dividing lines of identity and culture, defend human rights (e.g., the rights of ethnic minorities, women, and children), and rise to the demands of modern-day challenges (e.g., the COVID-19 pandemic).

Simultaneously, ethical GCE must produce global citizens who are not so focused on the present that they forget about the past and the future (intergenerational mindset). From this perspective, ethical GCE is primarily a reflexive pedagogical paradigm concerned with relational, existential, and praxis themes, because it enables students to critically investigate domains of theory and practice that traverse intellectual frontiers, concepts, and practices while promoting their capability to act within a comprehensive time window that encompasses both past heritage (s) and the potential ramifications their actions have for future generations. If considered in this light, ethical GCE may also encourage students to believe that they can contribute to the construction of a new future based on social justice. It may become a “pedagogy of hope” (Freire 1972) or a “pedagogy of value,” through which educational institutions and educators can show that they have not yet become ignorant about political and moral issues.

Thus, Ethical GCE can be thought of as a five-dimensional framework, with educators working to implement into their curriculum the five dimensions of values creation, identity progression, collective involvement, glocal disposition, and intergenerational mindset. Each dimension reflects a significant developmental route with specific characteristics that educators may incorporate into their GCE pedagogy to help students

become value creators, emancipated, empathic, and actively involved ethical global citizens. To foster ethical global citizens, educators should create programs that function across all five domains. This procedure does not have to follow a predetermined order or a linear path; it can be viewed as circular. For instance, establishing learners' collective engagement may lead to a later extension in the boundaries of one's citizen identity, or developing a value-creating and intergenerational disposition may lead to a later realization of a glocal disposition – in the lifespan of the individual learner.

## Conclusion

Ethical CGE as a teaching method must be based on concepts of mutual respect and accountability. Herewith, educators must assist students in learning to recognize both the desirable and undesirable moral obligations that come with living as a human being at this time – for instance, by recognizing the roles that developed countries, big corporations, and some political leaders have played in the creation of systems of inequality, oppression, and mistreatment throughout history. This framework may be tailored to fit the circumstances, goals, and objectives of individual schools and institutions. Lastly, the proposed framework, by its very nature, is open to critical scrutiny. It can readily be revised and presented as a flexible analytical tool, ready for further modification and refinement in relation to distinct educational contexts.

## Introduction

### Why Is Ethical Hacking Necessary?

With today's Internet and the development of the information society, the physical world and the virtual one become strongly intertwined. Actions in the digital realm, in particular illegal or aggressive ones, can have direct impact on people, companies, and the society at large.

Personal data leaks facilitate identity usurpation in real-world transactions, both in the physical world and in the virtual one. Cybersecurity breaches in a company may lead to direct financial loss or trade secrets disclosure that can affect competitiveness and can impact the economy. Critical infrastructures (power plants, hospitals, banks, telecommunication companies, transportation infrastructures, food and water supply chains, etc.) are vulnerable to cyberattacks. Entire sections of our society are potentially paralyzed in case of a successful attack. Foreign unfriendly countries may target companies and critical infrastructures in order to get potential means of retaliation or even to reach a decisive advantage in case of a cyberwar. Even fundamental rights and other democratic values can be threatened, for example, when voting infrastructures are compromised.

From an ethical perspective, several values are at stake in this context: privacy, health, well-being, economic prosperity, security, autonomy, self-control, justice, fundamental rights, and other

democratic values (Pavone et al. 2016). There is a societal responsibility to protect these values and therefore to promote cybersecurity through balanced and proportional measures, not only responsive ones but also preventive ones.

In order to address cyber threats, a combination of technical, organizational, and social preventive measures are taken at different levels, from the conception of the system to its development, as well as during its operational phase. An important measure consists in regularly testing and evaluating the actual resistance of a functioning system to realistic (cyber) attacks committed by so-called *ethical hackers* or *white hat hackers*.

Ethical Hacking

Ethical hacking can be defined, in very broad terms, as the authorized attempt of cybersecurity violation for prosocial purposes. Ethical hacking should be clearly distinguished from black hat hacking, which is both unauthorized (and thus illegal) and aimed at malicious purposes (e.g., personal gain at someone else’s expense) and gray hat hacking, which is not authorized (and thus illegal) but not aimed at malicious purposes. The most common prosocial purpose of ethical hacking is the authorized testing of the security of a system.

What Ethical Hackers Are Not

Some hackers are unambiguously *not* ethical hackers: hackers with malicious motives who act illegally. A *skilled* hacker of this type is often referred to as a *black hat*. Black hats search for flaws in applications, protocols, operating

systems (OS), machines, and servers, in physical hardware or virtual devices, and in network systems, which can be compromised. When they find vulnerabilities, they access a computer system or an IT infrastructure without authorization. According to most countries’ laws, this is illegal. The typical goals of black hat hackers are to steal sensitive information, such as personal or corporate data, and either to sell these information to other (cyber) criminals or to blackmail users or companies, for example, by demanding a ransom in exchange to repairing a compromised system. Script kiddies are not real hackers but people who use tools or services developed by black hat hackers in order to pursue similar activities.

*Gray hats* are similar to black hats in relation to the law but differ from black hats in terms of their motivations (see Table 1). Their primary motivation is not to intentionally harm others or to gain financially at the expense of others. Rather, they have subjective motivations such as the intellectual enjoyment, pride, and peer recognition of their hacking skills. Alternatively, they are committed to personal moral or ideological views that require achieving some ethically good objectives (including forcing others to improve cybersecurity measures) while minimizing harm and, when these conditions are satisfied, justify the means, even when the means are illegal.

What Ethical Hackers Are

The most common meaning associated with the expression “ethical hacker,” or equivalently “white hat” hacker, is probably that of “a skilled programmer and computer expert who looks for vulnerabilities in software, protocols, OS, computers and servers, in other physical or virtual

devices, and in network systems in order to improve the IT-security of a system” (Jaquet-Chiffelle and Loi 2019, sec. 9.3.2) and is *hacking by commission*.

Most of the time, the ethical hacker is an experienced and skilled professional employed by an IT security company, or more specifically by a pen-test<sup>1</sup> company, that is a contractor of another company whose IT security and computer infrastructures need to be tested. A contracting company will authorize and require the ethical hacker to try to circumvent its cybersecurity measures in order to find possible vulnerabilities and to highlight potential weaknesses. We may use “penetration testing” to indicate all activities in which the conductor of the attack is mandated by the target’s IT security and acting within the limits defined by such mandate.

The ethical hacker (or white hat hacker) acts legally and commit herself or himself to behave in a trustworthy way toward the contracting company. Indeed, in this configuration, the ethical hacker operates with the consent of the latter and abides by all applicable laws, and the perimeter of interventions is defined contractually.

A strong trust relation is required for a company to allow the ethical hacker to attack its own system. First, a nonethical hacker could take advantage of the mandate to steal sensitive information or to install permanent backdoors (or conceal some vulnerabilities) in order to keep unauthorized access to the system even after the expertise is over. Then, the ethical hacker might discover accidentally, while accessing the IT infrastructure, nonrelevant information for the expertise that shed light on legally or ethically questionable behaviors within the company. If such information were made public, the reputation of the contracting company might be at stake. Therefore, the ethical hacker’s faithfulness toward the contracting company is expected in order to prevent potential negative side effects of the security testing itself from the company’s perspective.

## How Trust Is Reinforced

Trust in the context of ethical hacking is therefore crucial. On one side, the ethical hacker should trust the contracting company that he or she will not be accused of illegal activities as a consequence of his or her attempts of cybersecurity violation realized during the course of the mandate. On the other side, the contracting company needs to be sure that the ethical hacker will act in a faithful way, respecting the company’s interests. Without such a strong trust relation, the company would hesitate to have its IT system tested for vulnerabilities and would balance the risks of being affected by actual cyberattack vs by the preventive ethical hacking itself. In order for the company to have incentives to hire an ethical hacker, the trust relation must be similar to the one between a medical doctor and his or her patients, or even between a lawyer and his or her clients.

Two elements contribute to building trust and defining the mandate of pen testers: a contractual agreement and a strict code of conduct that protects both their relationship with their clients and their client’s interests.

*Transparency* is a key factor in building trust. The contract between ethical hackers and their clients should address in a transparent way what is expected (companies only wanting the ethical hacker to confirm that there are no flaws and no IT vulnerabilities in their system might be disappointed), what is authorized and what is not, as well as the scope of the mandate (which parts of the IT system have to be tested and which ones are excluded if any). Non-disclosure agreements are necessary but not sufficient. The manner in which all discovered vulnerabilities and weaknesses are reported, and to whom, should also be precisely expressed in a transparent way.

The *reputation* of the pen-test company is decisive too in building trust and one of its most important assets next to its skilled employees. Internal procedures are often introduced to ensure reputation sustainability. All ethical hacker employees have to comply with a strict *code of conduct* that protects the contracting company’s interests and makes the pen-test company trustworthy.

<sup>1</sup> Penetration testing

The *code of conduct* specifies rules that the ethical hacker has to abide by in order to avoid attitudes that could create tort to the hiring company. Characteristic elements of a code of conduct are obtaining a written permission prior to assessing IT security, staying within the limits of the client's expectation, respect for the client and its employees' privacy, using documented processes for all actions taken to attack the system, transparent communication, removing any additional programs introduced in the IT system during the mandate, not introducing backdoors, and informing the client of all found vulnerabilities and weaknesses (the hacker cannot keep such information hidden for his or her own interest).

### Ethical Values at Stake

In this context, ethical values appear at three different levels: at a societal level, at a business level, and at a personal level (Jaquet-Chiffelle and Loi 2019, sec. 9.4.2).

At a societal level, priority is mainly given to protecting citizen's interests (privacy, health, well-being), country's interest (economic prosperity, security, autonomy), and democratic values (nondiscrimination, justice, and other fundamental rights). At a business level, values are often oriented by economic purposes (competitiveness, profit, reputation, and sometimes sustainability). At a personal level, values are usually driven by moral principles or ideological views (e.g., honesty, faithfulness, own sense of justice, fairness, equity).

Even when some of these values are shared between some of these three levels, they are not necessarily prioritized in the same way. Therefore, tensions can occur when conflicting values have to be taken into account, even within a same level, in order to make a practical decision.

### Ethical Dilemma for Ethical Hackers

On the one hand, ethical hackers have to comply with values defined in the strict code of conduct. On the other hand, being ethical may also mean respecting other (sometimes conflicting) values. Therefore, in some situations, ethical hacking cannot necessarily be deemed ethical in the broad sense.

Clearly, codes of conduct strongly focus on business-oriented values. When hackers' own ethical values and moral principles conflict with those values, especially when they include them with a lower priority than some other moral objective, ethical dilemmas and tensions between different orientations toward justice will arise. For example, penetration testers may find proof of grossly unethical behavior within the company they have been hired to test. A tension might arise if this unethical behavior has consequences that affect a large population or the country security, for example. The ethical hacker might balance the consequences of respecting the code of conduct vs breaking the code of conduct and revealing the behavior so that it stops. Respecting the code of conduct would allow the company to pursue its strongly unethical behavior which might affect personal values of many people, other companies' assets, or even societal ethical values. Breaking the code of conduct would bring a short-term direct improvement with respect to the unethical behavior of the company but might refrain other companies to hire ethical hackers and run penetration tests, which would affect the global cybersecurity in the country and therefore also endanger other ethical values at a societal level in the long run. The ethical evaluation to solve this dilemma is not straightforward. It depends on a fine evaluation of the consequences of both decisions, as well as on the own value prioritization of the ethical hacker.

In this case, we have a conflict between a strictly deontologically inclined morality and rule-consequentialist one. A strict form of deontology is entirely *agent-centered*: there is a strong moral distinction between the agent's own duties (e.g., abiding to the code of conduct), which are morality's own focus, and bad outcomes that are produced by other agents. Suppose that you and your co-workers end up being the prisoner of a sadistic terrorist who decides to torture you. She hands you a loaded gun and tells you "you either kill one of your colleagues, or I will kill both of them myself." A strict deontological morality solves the dilemma by refusing to kill. By contrast, a consequentialist morality is *outcome-centered*: you ought, especially in a situation like this

in which the payoffs are clear and there is little possibility of self-serving bias, to choose the lesser devil and kill one of the two colleagues. This will amount to a single homicide (a bad outcome), instead of two (an obviously worse one). The dilemma does not provide a strong case for the superiority of the consequentialist solution. Clearly, the rational arguments in favor of the consequentialist solution are very strong in this case. As a possible argument against it, consider a variation of the situation in which you do have a bias in favor of one of the two colleagues, e.g., you are his or her friend. The morality of the consequentialist choice may be disputable if you end up choosing him as the person whose life ought to be spared (as opposed to, say, flipping a coin). In the cybersecurity dilemma, consequentialism most plausibly dictates that the evil actions of the inspected company be made public, breaking the confidentiality agreement. This is (let us suppose) clearly the action that chooses the lesser evil. But a strict deontological view of morality views things otherwise: strict moral obligations of *the hacker* only concern what the hacker is *directly responsible for*, namely, to avoid actions that would violate duties to the employer. There is no comparable obligation to prevent *the employer* to do evil by violating *its* moral duties to others. As said above, deontological morality is focused on the agent's own action, so it gives priority to the duties which may be violated by one's own actions when this has to be balanced with preventing duty violations by others.

Dilemma can also arise even for ethical hackers willing to fully respect the code of conduct whatever the (ethical) consequences are. When an ethical hacker is testing the IT infrastructures of two different companies, testing the first company might reveal its unethical behavior toward the second one, using a zero-day vulnerability that would have been impossible to detect by the ethical hacker if he or she had only assessed the security of the second company. However, knowing the attack allows the ethical hacker to look for specific traces in the IT infrastructure of the second company and find evidence of the

attack. Respecting the code of conduct requires him (or her) both not to divulge this zero-day vulnerability (faithfulness toward the first company) and to reveal it to the second company (obligation to inform the client of all found vulnerabilities and weaknesses). Whatever the practical decision is, the ethical hacker will have to break the code of conduct from the perspective either of the first company or of the second one. The choice might depend on the ethical hacker's own values, morality, and personal evaluation of the situation. In this case, like in the former, different *substantive* moralities, grounded in moral values *outside* those made explicit by code, may dictate the resolution of the dilemma. As in the previous case, a strict deontological morality requires that the ethical hacker leaves the second company due to an irresolvable conflict of interest. A consequentialist morality requires that the vulnerability be communicated, as this is the action that achieves the highest level of security for all parties involved.

## Conclusion

Due to the fact that prosocial goals, even within the business sphere, may conflict, ethical hackers may face ethical dilemmas. The standard rules included in ethical hackers' code of conducts may not provide solutions to these dilemmas, which will have to be solved by appealing to the hackers' own morality. Hence the solution to these dilemmas is not always "ethical" in the same narrow sense in which code of conducts are. This points to the need of a broader and deeper engagement with ethics for practitioners.

Ethical behavior cannot be reduced to a checklist of ethical conditions to fulfill. Practical decisions often need to take into consideration conflicting ethical values, as well as how these values are prioritized. The prioritization itself is not absolute and depends in particular on the ethical hacker's own moral choice, e.g., either a strictly deontologically inclined morality or a rule-consequentialist one.

## Ethical Issues Facing Domestic Workers

## Synonyms

Marginalized home laborer

## Introduction

Many families today rely on the labor of domestic workers to meet their caregiving needs (e.g., child care and elderly care) and their domestic responsibilities (cleaning, cooking, and other household maintenance tasks). Domestic workers, who the International Labour Organization (ILO) simply define as including those who are employed in private households, are primarily women. In fact, figures from 2016 show that one in 25 women worldwide are working in domestic work (ILO 2016). In 2015, the ILO estimates that there were 67.1 million domestic workers worldwide, 17.2% of whom are migrant domestic workers (Galloti 2015).

There are many ethical issues that are associated with domestic work.

## Recognizing Domestic Work as “Real” Work

Domestic workers find it difficult to receive proper financial compensation. That the majority of domestic workers are women also lead to increased stigmatization of domestic work. In light of the ongoing devaluing of women’s work, with care and domestic work perceived by many societies as coming “naturally” to women and therefore not truly requiring much effort, many domestic workers find it hard to get their labor contributions recognized.

In addition, because domestic work is part of the informal economy, its economic and social value does not get recognized even though most households with caregiving and/or domestic responsibilities will not be able to function without domestic workers. Such undervaluing raises an important ethical conundrum concerning the recognition of feminized forms of labor, introducing the question of how can – and how should – domestic work be recognized. Although countries such as the Philippines have passed legislation that stipulate a minimum wage for domestic workers, other countries remain reluctant to do so because of the fear that setting a set wage for domestic workers would present undue financial

hardships for employers. Achieving a balance between fair financial compensation for domestic workers and affordability for employers becomes a pressing issue. Initiatives passed in France and in Belgium that allow the state to partially subsidize the payment of a minimum wage for domestic workers may be one way to meet this balance.

### **The Difficulty of Regulating Domestic Work**

Domestic work is undertaken within the private sphere of the household. Unlike other work sites, where labor regulations and health and safety standards are set, households are not a regulated work site. Consequently, domestic workers have a challenging time ensuring that their labor rights are met, not only in terms of financial compensation but also in terms of ensuring that they receive appropriate breaks and time-off, that they work in safe and nonhazardous environments, that employers respect the terms of their employment contracts (if they have signed one), and that their right to privacy is respected (if they are living with their employers).

More crucially, the very nature of domestic work is such that the relationship between domestic workers and their employers oftentimes does not resemble a standard working relationship but has instead been characterized as falling closer to a family relationship. The adage that domestic workers are “part of the family” is in fact commonplace. Conceptualizing the employment relationship as such further compounds the difficulties that domestic workers face when seeking the recognition of their labor rights. For example, refusing employers’ request to work overtime or to undertake tasks *beyond* domestic work becomes difficult for domestic workers when they are seen as “family members” who have to participate in household maintenance. For live-in domestic workers, these boundaries become even less defined. The ethical dilemma thus concerns, first, how states can realistically ascertain that labor standards are met when households are, by definition, private spaces and second, whether and how domestic and care work can and should be distinguished from other forms of work.

### **Migrant Domestic Worker Programs as Contributing to Inequality Between States and to Prolonged Family Separation**

Most domestic workers are migrant women who left their families behind in order to work abroad. Global South countries, through their labor brokerage regimes (Rodriguez 2010; Guevarra 2009), encourage the out-migration of their female nationals because the remittances sent by migrants are a crucial source of national revenue. Because of the imbalance in power between migrant-sending countries and migrant-receiving countries, the ability of migrant-sending states to pass multilateral policies that will strengthen their ability to protect their nationals while working as domestic workers abroad is sharply curtailed. And even when migrant-sending states pass policies that are intended to protect migrant domestic workers – such as prohibitions in the out-migration of its nationals to work in countries that are known to be abusive towards migrant domestic workers – abysmal economic conditions within their states mean that people find ways to migrate to “banned” states. The larger question of whether migrant domestic worker programs can ever be ethical because they rest on continued power imbalances between migrant-sending and migrant-receiving states thereby emerges. That these programs exacerbate the brain drain within migrant-sending countries, thereby creating labor shortages in crucial industries, also becomes an issue.

In addition, migrant domestic worker programs contribute to inequalities between families. Migrant domestic workers have to leave their families and their children behind while frequently working for families in richer states that do not have to live apart. The fact that migrant domestic workers leave their children behind to care for the children of families in affluent countries brings up questions of uneven standards of care. Critics of migrant domestic worker programs argue that these programs enforce family separation, forcing countless of children to grow up without their parents. Such critics argue that migrant domestic workers should have the option of being able to come with their families. While

scholars have pointed to the resilience migrant women and their families exhibit when adapting to family separation (Francisco-Menchavez 2018), these situations are unideal. The prolonged effects of family separation on migrant women and their families include but are not limited to mental and emotional stress, depression, anxiety, and marital breakdown. Even though labor migration confers economic gains for migrant women, whether the financial gains they receive are enough to compensate for the personal hardships emerging from prolonged family separation introduces questions about the ethics of maintaining existing labor migration programs.

### **Determining Migrant Domestic Workers' Settlement Rights in Migrant-Receiving States**

Migrant domestic workers' long-term presence in migrant-receiving states introduces questions of settlement. While the vast majority of countries that accept migrant domestic workers do not provide migrant domestic workers with opportunities to settle permanently in their countries, the reality that many migrant domestic workers have been present for prolonged periods of time mean that for some immigration advocates and researchers (Carens 2013), any ethical immigration policy should accord them with the right to permanent settlement. In countries like Canada, migrant domestic workers' ability to apply for permanent residency was granted following migrant domestic workers' calls that "if they are good enough to work, they are good enough to stay."

### **Ethical Issues in Providing Behavioral Health Treatment to Vulnerable Populations**

Geraldine S. Pearson  
 UCONN Health, Farmington, CT, USA

### **Synonyms**

Disenfranchised populations; Ethics in clinical practice; Health disparity; Health equity; Human rights

### **Definition**

Mental health vulnerabilities exist across the lifespan and involve numerous risk factors. Vulnerability involves these complex, interactive, and cumulative risk factors that result in adverse effects on health throughout the lifespan (WHO 2001). The US Surgeon General's Report on Mental Health identifies that "even more than other areas of health and medicine, the mental health field is plagued by disparities in the availability of an access to its services." These disparities are viewed readily through the lenses of racial and

cultural diversity, age, and gender (DHHS 1999, P. vi). There are significant differences in “social, economic and educational contexts among many population groups which subsequently place them at greater risk for poor mental health” (Pearson et al. 2015, p. 14).

Braveman et al. (2011) defined health-care disparities as typically “plausibly avoidable health differences according to race/ethnicity, skin color, religion, or nationality; socioeconomic resources or position (reflected by, e.g., income, wealth, education, or occupation); gender, sexual orientation, gender identity, age, geography, disability, illness, political or other affiliation; or other characteristics associated with discrimination or marginalization (S150).”

Other factors characteristic of a population with behavioral health needs putting them at risk for care inequities and health disparities include degree of psychiatric illness impairing functioning, level of perceived dangerousness, and degree of stigma they experience, related to behavioral health. These terms and factors are in turn, conceptually part of the broader definitions of health disparity and health equity, terms discussed at length in the literature, particularly in the Healthy People 2020 movement identified by the US Department of Health and Human Services (USDHHS 2010). The National Institutes of Health defined health disparities as “differences in the incidence, prevalence, mortality, and burden of diseases and other adverse health conditions that exist amount specific population groups in the United States.” Health disparities occur with populations having medical and behavioral health-care needs. Providing care to populations with health disparities is challenging.

These concepts are also reflected in a number of international ethics documents including the United Nations International Universal Declaration on Bioethics and Human Rights (UNESCO), the Belmont Report, the Declaration of Helsinki, and the Council for International Organizations of Medical Sciences (CIOMS) guidelines (Zagorac 2016). All emphasize the right to health and health services with the elimination of marginalization and exclusion of persons for any grounds. All of

these documents focus on the need to protect the vulnerable in research and care models, while the manner of providing this protection is not elucidated in any of these guidelines (Zagorac 2016).

All policy makers and international agencies agree that vulnerable populations need protection without identifying the exact process occurring at an actual care level in a treatment setting. It is difficult to precisely define health disparity in a heterogeneous population. While this might be the first step in defining the behavioral health issues present in a disenfranchised population, it is muddled by the myriad of influencing factors on the concept of vulnerability. If vulnerability is a fluid concept, it potentially changes over the lifespan. Research has identified that racial minorities, those in underserved socioeconomic groups, and those with chronic psychiatric illness are vulnerable by static factors. Others can change, such as socioeconomic status, health status, and community of residence. Identifying the individual factors that make vulnerability and constant risk while being aware of the individual’s unique circumstances is essential to providing ethically balanced care.

Importantly, all of these categories reflect the individual’s or group’s status in a social hierarchy. Not all health disparities define health differences. Instead, they are relevant to “social justice because they may arise from intentional or unintentional discrimination or marginalization” and, in turn, “are likely to reinforce social disadvantage and vulnerability” (Braveman et al. 2011, p. S150). The major professional groups providing behavioral health treatment (physicals, nurses, psychologists, social workers) to all populations clearly state and endorse nondiscriminatory health-care practices aimed at minimizing health disparities. All mental health professionals encounter vulnerable populations in their work. “Mental healthcare professionals face numerous and difficult challenges” (Hem et al. 2014). Uncertainty about the right treatment, need for coercive treatment measures, and the individual’s competence are all influences.

The ethical issues inherent in providing behavioral health care are embedded in all levels of care

provision beginning with the individual needing care and moving through the professional providing care, the setting of the care, the community where it is given, the philosophical model of the institution where the care is given, and the financial structure the society uses to pay for the care. Each of these entities has their own ethical challenges and dilemmas.

### **Applying Ethics to Specific Behavioral Health-Care Practices: Community Health Clinics**

The Primary Health Care Behavioral Health model has been proposed and implemented as a model for community treatment in many health systems both in the United States and internationally. It focuses on a team-based model of care that integrates physical and behavioral health needs. It is population based and can accommodate a large number of patients within a community. The goal is continuity and longitudinal engagement with patients and families rather than being specific to one episode of illness (Reiter et al. 2018). Vulnerable populations tend to use the community health-care system for their care as it is affordable, available, and focused on the entire person or family requiring services.

In this model of care, the clinic is located in a community known to providers. Care is shared by a number of health-care specialties and is full service, i.e., involving medical, dental, adult and pediatrics, obstetrical, and behavioral health services in one location. The ethical issues presented by this model of integrated care reflect many of the ethical issues encountered by other providers, in other settings. They will be summarized here as an exemplar.

Runyan et al. (2018) identify the common ethical issues particular to the community health-care system. They note that the traditional model of ethical care has applicability to the single-episode model of treatment, with a clear beginning and ending point and one clinician in charge of the care. In this interdisciplinary model, several individuals are involved with the patient and might

have various understandings on the ethical variances that are presented in this model. Reiter and Runyan (2013) note that while the primary health-care model focuses on the whole family, specialty mental health care typically looks at the care of the individual.

Ethical dilemmas require a view that is non-disciplinary related and pertains to the primary care environment. Issues of confidentiality, collaboration, and involvement of other family members can contribute to ethical dilemmas. The community health treatment model strives to decrease discrepancies in health status, services, or outcomes based on social inequalities among particular segments of a population. These differences comprise the factors noted early on. The concept of health equity involves the promotion and achievement of the highest level of health for all people and the absence, over time, of health differences related to age, gender, ethnicity, and underserved status.

### **Applying Ethics to Psychiatric Practices**

Ethical psychiatric care involves providing the individual and family with care that fosters development and health. This involves providing support for individual/family/community strengths, development of collaborative partnerships to prevent and treat illness, enhancing public and professional education and awareness, and advocating for mental health promotion, treatment, and translation. Application of ethical practices means that the mental health professional adheres to the highest standards of behavior and respect toward individuals in their care, regardless of that person's status or presentation.

physiotherapy; Tele-physiotherapy; Virtual physiotherapy services

## Introduction

Digital physiotherapy represents the use of electronic communication and information technology to deliver online physiotherapy consultations, diagnostics, and actual implementation of remote therapies by using state-of-the-art tools based on a framework that facilitates a patient-therapist relationship regardless of location.

The rapid development of information and communications technology, as well as the fact that the world is experiencing an unprecedented global pandemic, requires that healthcare professionals adjust to these changes. Physiotherapists all over the world are now delivering health care in a new remote way, using online tools to enable patients to improve therapeutic outcomes and therefore increase a service user's independence and control in managing their own healthcare problems. For quite some time, physiotherapists have been using different mobile devices such as phones, tablets, and smartphones in both treatment and as treatment support because of its high reach and low-cost solutions (Dicianno et al. 2015). The transition from traditional treatment methods based on information technology, more precisely to applications based on smartphones, is nowadays extremely important for the effective and efficient treatment of various groups of patients (Jin et al. 2008; Physiopedia 2020a). It has been shown that the use of advanced technology has had a positive effect on therapeutic results (Owens et al. 2020). By using smartphone programs specific to home physiotherapy programs, patients experience a new way of performing physiotherapy that encourages their active participation during physiotherapeutic treatment.

## Online/Digital Physiotherapy

Digital physiotherapy is considered to be more comprehensive than tele-physiotherapy because

it represents the range of specific technologies available and their impact on physiotherapy client-centered practice and service models. According to World Confederation for Physical Therapy (2020), digital physiotherapy should be used to refer to healthcare service delivery, as well as support and information that are delivered remotely using digital communication and devices. The main goal of digital physiotherapy practice is to facilitate the effective delivery of a client-oriented approach of physiotherapy services by improving access to health care, information, and managing health care resources.

Online or digital physiotherapy represents an alternative to a standard face-to-face physiotherapy appointment, based on which patients can receive instructions, exercises, and support through an online program to be completed in a home environment (RateUsOnline 2020). Given the ongoing pandemic, various healthcare facilities have been increasing the practice of virtual reality physiotherapy, which is also beneficial for patients due to its convenience, control, and reduction of unnecessary costs. Recent analysis showed that 70–75% of patients prefer virtual treatment over in-person physiotherapy session (RateUsOnline 2020). Nevertheless, online physiotherapy is a relatively new practice; it is designed in a way that helps patients receive the exact type of care they would receive if they were admitted for healthcare treatment in the traditional way. The only difference is that patients do not meet with the physiotherapist (Lambert et al. 2017).

Digital physiotherapy has many benefits for patients as it provides a sense of personal autonomy and empowerment, enabling them to take control in the management of their condition (Brennan et al. 2009). Within the process, patients are becoming active partners rather than passive participants in their care. Online physiotherapy enables access to rehabilitation for patients living in remote areas, as well as to those with mobility issues associated with physical impairment, access to transport, and socioeconomic factors (Theodoros and Russell 2008). Additionally, this type of physiotherapy also reduces transportation costs and saves patients the time they would spend

on transportation (Kairy et al. 2009). However, online physiotherapy is not beneficial only for patients but also for physiotherapists, since it represents a continuation of rehabilitation that they are able to monitor (Brennan et al. 2009; Australian Physiotherapy Association 2020). According to previous research, online rehabilitation within the patient's own home environment leads to greater functional outcomes (Hale et al. 2003).

### **Individualised Patient-Centred Physiotherapy**

Kittelson et al. (2020) studied the concept of person-centered health care from different perspectives and in this context and on the basis of evidence-based physiotherapy practice, formulated directions relating to patient-centered physiotherapy. Thus, patient-centered physiotherapy represents a collaborative approach to physiotherapy services developed in partnership with patients. This means that the relationship is based on respect and is at the same time adapted to individual patient's needs, values, and preferences, whereby patients engage the assistance and support of a physiotherapist.

Although individualized patient-centered physiotherapy is considered an integral part of a physical therapy practice, it does not have a general definition (Wijma et al. 2017). The philosophy behind the concept emphasizes the organization of delivering physiotherapy based on patients' needs, preferences, and experiences. Despite the fact that the concept is widely endorsed, it still lacks detail and clarification in order to be effectively implemented (Jesus et al. 2016). Practicing online patient-centeredness in physiotherapy requires a dedicated physiotherapist capable of performing an individualized patient's treatment. Additionally, the physiotherapist must be capable of continuous communication (verbal and nonverbal) with patients and has to be focused on his continuous education and self-development during all aspects of treatment. Moreover, social skills, specific knowledge, and, last but not least, confidence are of essential

importance to be able to work with patient's defined goals in treatment and to properly empower patients through providing the support needed (Wijma et al. 2017). Thus, it is important to explore the patients' view on patient-centered physiotherapy, and, on the other hand, it is equally important to also identify the physiotherapists' perspectives on the meanings, attitudes, and limitations related to the same concept. If the patient and the physiotherapist do not have at least a similar view on the patient-centered physiotherapy, this could mar the implementation of the concept as the patient might be unsatisfied (Ahenkorah and Snowdon 2015). Equally important for the successful implementation of the concept is to identify potential barriers by physiotherapists, such as financial constraints, lack of staff, space and equipment limitations, generally low morale, lack of patient understanding about their role in physiotherapy and their health condition, etc. (West et al. 2005). However, in the process of preparing a patient's physiotherapy program, physiotherapists can often only rely on their clinical experience and reasoning, which could in the end also result in patient-centered physiotherapy (Cruz et al. 2012).

## Ethics of Online Physiotherapy

Ethical aspects must be taken into account in all forms of health care, including in the context of digital physiotherapy. Due to the fact that physiotherapists can see patients via virtual physiotherapy on a case-by-case basis, decisions must be based on clinical judgment, the client's informed consent, and professional standards of physiotherapy care (Brennan et al. 2010). Implementation of online physiotherapy requires that organizations or physiotherapists ensure the same level of ethical standards, compared to the provision of physiotherapy services in the traditional way, when technology is not used. However, before implementation of online physiotherapy, it is important to determine which patients are suitable for this kind of therapy, according to patient's resources, information technology knowledge, possession of appropriate technology, and the urgency of

medical care. Additionally, it is important to take into consideration the patient's abilities to participate in online physiotherapy (visual or hearing impairment). Thus, physiotherapists should always consider whether virtual physiotherapy is the best intervention for the specific patient, especially when dealing with vulnerable groups. Furthermore, physiotherapist should think about the patient's treatment results and desired outcomes (Cottrella and Russell 2020). It is also important to have the patient's written consent of voluntary participation, as they must also be informed of the fact that they may at any time withdraw from such provision of health services (Australian Physiotherapy Association 2020). In order to ensure appropriate ethical standards, practitioners must first consider goals of online physiotherapy consultations while ensuring patient safety. As part of the latter, they must ask themselves if the patient's health condition can be addressed via online physiotherapy and how urgent it is for the patient to receive the physiotherapy treatment. As previously mentioned, the practitioners have to consider the patient's ability to interact with technology as well as suitability of the technology possessed by patients. Additionally, it is necessary to evaluate the benefits and the barriers of practicing online physiotherapy (Physiopedia 2020; World Confederation for Physical Therapy 2020).

## Patient Consent

Within the informed consent of the patient (Sim 1998), the guiding principle must be respect for the patient's autonomy (Beauchamp and Childress 2001). Therefore, the patient's consent needs to be obtained before starting online physiotherapy treatment; additionally, physiotherapists need to consider issues regarding technology, first in terms of the patient's technological capabilities and IT knowledge, and must then provide information about online treatment specifics, that is, benefits and barriers to the use of IT (Chaet et al. 2017).

When informing patients about technology, health professionals have to consider the fact that the required information may vary between patients due to their familiarity with technology (Pirtle et al. 2019). In online treatment of

vulnerable groups such as children and the elderly, physiotherapists additionally need to include the patient's parent, caregiver, or advocate (World Confederation for Physical Therapy 2020).

Prior to any treatment, physiotherapist should therefore consider how to provide patients with clear and concise information about telehealth and any information about expenses in this respect. Additionally, patients need to understand why physiotherapists plan to see them via online sessions and not in person. As previously stated, obtaining written or verbal consent is mandatory when performing online physiotherapy, as well as any additional consent in case of recording or taking pictures during the physiotherapy treatment (Physiopedia 2020).

As soon as we start talking about video treatment, we need to be aware that *Patient privacy* concerns may arise. Considering the fact that – in the context of online physiotherapy treatment – patient's medical information is available on multiple devices, there is increased risk of security issues, which can affect the patient's willingness to participate in online sessions (Mehta 2014). Accordingly, it is imperative that we provide the same level of privacy and confidentiality in online physiotherapy as if we were providing healthcare services to patients in the traditional manner.

The use of online physiotherapy also creates many issues in relation to *Technology security issues*. In this regard, it is necessary to provide a secure platform with end-to-end encryption (World Confederation for Physical Therapy 2020). In most cases, people trust that common applications are safe to use; however, some do not trust applications unconditionally (Dart et al. 2016). It is also necessary to consider solutions for storing electronic information such as patient data (photographs and videos) that need to be kept in a secure location and only accessed by authorized healthcare professionals caring for the patient's health care (World Confederation for Physical Therapy 2020).

As part of the development of digital physiotherapy practices, it is necessary to include regulatory bodies, which will have to define ethical standards as well as guidelines for charging for

online health services (World Confederation for Physical Therapy 2020).

## Ethical Issues When Interacting with Indigenous Music and Musicians

Monique Giroux

Indigenous musics in intercultural contexts;  
Respectful use of Indigenous musics

## Introduction

The music of Indigenous peoples – and indeed the “Indian sound” as described by Philip Deloria (2004) – has long fascinated European colonizers. In the United States and Canada, composers and musicians have used Indigenous musics as a way to create a uniquely American or Canadian sound – European in its form, but with Indigenous elements that seek to distinguish it as North American. This approach was promoted by ethnologists like Theodore Baker, Alice Fletcher,

and Marius Barbeau, among many others, who actively encouraged composers to use their recordings and transcriptions of Indigenous musics to create new works. As a result, there is a copious number of “Indianist” compositions, written for the most part by non-Indigenous composers. These include works in a range of genres, from Western art music, to Tin Pan Alley songs, to country and western hits. Although many of these works date back to the early twentieth century, the practice of integrating Indigenous musics continues to shape Western music genres, as particularly evident in the use of Inuit throat games in Western art music at the end of the twentieth century.

Indigenous peoples have used non-Indigenous interest in Indigenous musics to their own advantage, for example, as a way to ensure that their music is passed down to future generations or to challenge stereotypes. Yet in many cases, Indigenous musics have been used in unethical ways, such as in inappropriate contexts or without proper permission from those to whom the music belongs. In response to these types of abuses and the broader inadequacies of university-based ethics boards and the Western legal system, many Indigenous peoples have published ethical guidelines (Castellano 2004), and there are now numerous Indigenous-created policy documents and academic articles on the ethics of research (broadly defined) with Indigenous peoples. Most can be applied and/or adapted to music and collaborations with Indigenous musicians. In doing so, it becomes clear that the ways in which we (both Indigenous and non-Indigenous peoples) interact with Indigenous musics and musicians must center on respect and mutuality and that we must also consider the ethical and political implications of our aesthetic choices.

The following seven themes are drawn from Indigenous-authored scholarly literature and policy documents. Since most of this literature does not refer to music, each section provides suggestions about how the themes might be applied to music as well as questions collaborators should consider when working with Indigenous musics and musicians. These themes are intended to be used as guiding principles, not as a how-to

manual; and whenever possible, guidelines and protocols developed by a specific Indigenous community should be followed in addition to, or instead of, these principles. These nation-specific guidelines may be available in written format or may only be available in consultation with elders. As a final introductory note, this article is intended for a non-Indigenous readership who wishes to engage with Indigenous musics and musicians. However, Indigenous musicians and composers are not exempt from principles of ethical collaboration. In fact, Indigenous people who work with their own cultural belongings are typically held to the highest standards of accountability – often-times because of their lifelong relationships with their communities.

### **Theme One: Appropriation and Permission**

The issues of appropriation and permission are often addressed in the literature on respectful engagement with Indigenous peoples. Indigenous peoples consider improper access, collection, use, and/or interpretation to be theft; misrepresentation of a music culture and the imposition of dominant aesthetic categories similarly fall under the umbrella of appropriation. Although some of these practices may be considered ethical from a Western vantage point, Indigenous peoples have their own ethical standards and customary laws about how cultural belongings can and should be used, not only by outsiders but also by insiders (Battiste and Henderson 2000: 167). Existing (Western) laws related to copyright and fair use do not recognize these Indigenous laws and are in fact often at odds with Indigenous laws (Assembly of First Nations 2009: 15). For example, Western laws grant archives and collectors – not Indigenous source communities – rights to music-related belongings and do not recognize collective ownership of cultural materials. For this reason, potential collaborators should look to the standards of the specific Indigenous community with whom they wish to work in order to determine fair and ethical use of their music. These nation-specific ethical standards

have been developed in order to protect traditional knowledge from misuse (Assembly of First Nations [n.d.](#): 5).

The issue of appropriate representatives of a community emerges when determining the ethical and fair use of Indigenous musics. More specifically, not all community members are authorized to transfer knowledge or give permission to use their people's music; and collective permission might be required. Collecting (knowledge or music) from individuals not authorized to transfer knowledge is seen by Indigenous peoples as "akin to illegitimate land transfers historically or [the] purchase of sacred artefacts in violation of community ethics on access" (Castellano [2004](#): 105). Thus, in obtaining permission, Indigenous authorities as well as community-recognized elders and knowledge keepers must be consulted and their decisions respected as final (Ermine et al. [2005](#): 8). Furthermore, permission for use should establish an ongoing relationship and recognize that the community can withdraw permission at any time. The need to obtain permission is required for all musics that belong to an Indigenous nation, even music used for social (nonsacred) purposes and music viewed as nontraditional. Some of the questions collaborators wishing to avoid appropriation and misrepresentation should ask include: Has permission been obtained from community-recognized authorities/elders? Will the music be used in a culturally appropriate way? And how will ongoing permission for use be established?

## Theme Two: Mutual Respect

Respect is a theme that frequently emerges in both scholarship and policy documents. Although respect can be negatively associated with power (where a person or group with power expects obedience), in the context of Indigenous/settler relations, the concept of respect is used to emphasize the importance of partnerships of equality (a sharing of power) and the valuing of Indigenous perspectives and cultures on their own terms. A partnership approach recognizes that projects should be defined, developed, and completed with direct input from Indigenous peoples (Battiste and Henderson [2000](#): 132). From the perspective of

music collaboration, this means working closely with an Indigenous community to come to a consensus about which Indigenous song/tune, style, and/or genre is most appropriate for the project and what individual or individuals might be the most suitable collaborator(s) since not all Indigenous people have the relevant expertise (*ibid.*, 140). Music projects also require a collaborative approach to decisions about how the traditional or contemporary piece, style, or genre will be integrated into a new work or performance. Clearly outlining the roles and responsibilities that individuals have in the project (e.g., composers or co-composers, performers, elder consultants, and so on) can help facilitate a partnership model that centers on respect, as does embarking on a project as mutual learners where both partners "bring and gain knowledge" (Barney [2014](#): 2).

Projects that center on partnerships of equality ensure that Indigenous perspectives are given equal space from conception to completion and that Indigenous musics and musical practices are viewed as valuable on their own terms (i.e., by the standards set by Indigenous peoples). As such, collaborators should consider how a project incorporating Indigenous music might be constructed or viewed (perhaps unintentionally) as an act that refines or otherwise betters it or that maintains the dominance of Western music by forcing Indigenous musics to conform to Western standards. Expecting Indigenous music to conform to Western music encompasses issues of space, such as using Indigenous music as color or integrating Indigenous music without disrupting the expected form of a (Western) composition. It also involves issues around performance practice, for example, requiring Indigenous musicians to read music notation, but not similarly expecting non-Indigenous musicians to learn without a score or expecting that Indigenous music and musicians follow Western standards of musical presentation (e.g., in a quiet concert hall). To avoid these ethical pitfalls, some of the questions collaborators should ask include: How will partnerships be developed? Who will have decision-making power over the project? What processes are in place should disagreements arise? How will responsibilities/roles be determined and developed? And what measures are in place to ensure

the musicians and music traditions are treated as equals?

### **Theme Three: Benefits for Indigenous People and Communities**

Projects that engage with Indigenous music and musicians need to benefit Indigenous individuals and their communities, moving away from past practices of mining Indigenous intellectual property (Assembly of First Nations 2009: 5). These can comprise a range of benefits such as financial reimbursement, including direct compensation for the use of a community's music or the employment of Indigenous people; educational or professional opportunities and capacity-building, such as internships or learning opportunities that foster personal and community growth; entertainment and community enjoyment; recognition and accolades; and the revival and/or resurgence of Indigenous musics, among other possible benefits. Ideally, collaborative music projects should at the very least be equally beneficial to the non-Indigenous and Indigenous participants and should be particularly attuned to empowering Indigenous individuals and communities in their musical and cultural lives. (That is, as a reversal to past practice, the benefits accrued by non-Indigenous parties should be secondary to the benefits accrued by Indigenous individuals and communities.) Questions that collaborators should ask include: What are the financial, employment, educational, or other benefits? Who will gain the most from this project? How will equality of benefits be ensured and who will decide if, and to whom, the project is beneficial? Does the project promote community empowerment and capacity-building? And does it support the resurgence of musical practices in the community?

### **Theme Four: Giving the Music Back**

Ethical interactions with Indigenous musicians and music require giving the music back to the community. This giving back might incorporate

performances in the community, or recordings of performances that are made available to the community, or other possibilities depending on the desires or needs of the people. Liner or program notes should be accessible, readable, and translated into the community's traditional language. Presenting notes orally instead of, or in addition to, a written format may also be required. Community members should be given the opportunity to comment on all aspects of the performance or composition, and collaborators should be responsive to concerns and suggestions. This approach recognizes Indigenous peoples as "the guardians and interpreters of their culture, traditions and knowledge systems" (Assembly of First Nations n.d.: 6). Finally, collaborators should consider a literal giving back, determining in consultation with the Indigenous nation with whom they are working who will have rights to the new composition(s), recording(s), or other materials. At the very least, Indigenous peoples' right to have their cultural belongings removed from a project at any point or to ask that a composition or recording be no longer performed must be respected; that is, Indigenous rights to the music must be protected in perpetuity (Assembly of First Nations 2009: 14). In many cases, joint ownership (which encompasses issues around copyright and royalties) of the project will be the most appropriate protocol. Questions collaborators should ask include: How/in what ways will the compositions, performances, recordings, or other products be brought to community members? Will translation of materials be required? And in what ways will Indigenous rights to the music be safeguarded in perpetuity?

### **Theme Five: Community Well-Being**

Community well-being is an important consideration in all engagements with Indigenous music and musicians. Musical engagements should begin with full and informed consent, including clear and open discussion of the roles and responsibilities of all involved, as well as discussion of, and agreement on, what piece/style/genre will be used and presented. Any potential harms should

be discussed; in a music context, harms might involve misuse of the music by a third party, separation of the music from its cultural context, or misplaced ideas about to whom the music belongs. Projects should, furthermore, aim to be responsive to the community, addressing the needs particular to the nation. For example, communities may wish to use musical collaborations to address stereotypes, to engage youth with language revitalization, to connect with other Indigenous peoples, or to give the community a sense of pride in their shared culture. In some cases, community well-being might require delaying or cancelling a project if it places too many demands on a community whose attention is better turned to other concerns (Dunbar 2006: 182). Questions collaborators should pose in addressing community well-being include: What measures are in place to ensure informed consent? And in what ways is the project responsive to community needs?

### Theme Six: Self-Determination

The themes raised thus far emerge from a foundational belief in Indigenous self-determination. Although self-determination is somewhat of an elusive term and is as such used in a variety of ways, it is most frequently defined as the right of Indigenous peoples to pursue economic, social, and cultural development in the ways that they see fit and to determine their political status, including in what ways they wish to interact with other nations, in other words the right to manage their own lives. Musically, this means recognizing an Indigenous nation's right to engage in international musical interactions or alternately to not engage in these interactions; to determine whether they want their music used in new contexts, or prefer to have it remain relatively unchanging (or of course anything in between); to make decisions about who should speak (or perform) on behalf of the community; to control representations of their own music; and more generally to manage their own music and musical lives. Given the importance of acknowledging Indigenous self-determination, potential

collaborators need to approach an Indigenous community knowing that the collective has the right to decline any and all potential collaborations and, if they wish to participate, to decide in what ways they wish to be involved. Questions collaborators should ask include: Does the project center on substantial community engagement, approval, and participation from start to finish? And does it support Indigenous autonomy and sovereignty?

### Theme Seven: Challenging Colonial Relationships

This final theme encourages potential collaborators to use music to actively interrogate and dismantle colonial relationships (Chilisa 2012: 298). As Stó:lō musicologist Dylan Robinson notes in an article on performances that bring Indigenous and Western art musics together, interactions between musical traditions have ethical and political implications. Many of these implications may not be initially obvious. For this reason, “even composers with the best of intentions [can] inadvertently reinforce the hierarchy of music practices that maintain the dominance of art music as the genre to which one must conform” (2012: 237). Prior to engaging with Indigenous communities, potential collaborators should develop a thorough knowledge of Indigenous/settler relations. In the ensuing project, collaborators should consider how music might be used to reinforce or alternately redress inequalities. The assumed supremacy of Western art music, as well as the way in which it is often positioned as the norm, can, for example, be reshaped through thoughtful and careful musical collaborations. These collaborations can also be used to challenge assumptions about what constitutes “good” music (e.g., how ideas such as perfection, individuality, difficulty, or broad-based community involvement shape which musics we value), about who should lead music projects, and how music can and should be consumed and for what purpose (e.g., for social or spiritual purposes, or for intellectual challenge), among other possible assumptions. Questions collaborators should consider

include: How will discomforts (e.g., confronting one's own biases) be managed? How might this project be used as a way to support decolonization or to examine power and privilege? And what kinds of relationships are embedded in the composition, performance, or recording?

## Concluding Reflections

The issue of ethical engagement with Indigenous music and musicians ultimately needs to be understood through long-term relationships with the communities with whom one wishes to work. There is no checklist or comprehensive guide that will always be applicable in every circumstance; other, more specific, ethical principles will emerge upon consultation with Indigenous communities and will, furthermore, depend in part on the kinds of collaborations and the particular musics used in the collaborations. Drawn from the work of Indigenous scholars, the principles outlined above provide a starting point from which collaborators can develop nation-specific knowledge.

## Ethical Leadership

Leaders' ethical behavior; Virtuous leadership

## Definition

Ethical leadership is a leadership style that highlights the ethical dimension of leadership in management. It refers to the leader's values, ethical traits and ethical behavior in organizational settings, and the way they relate to employees, organizations, and society. Ethical behavior is understood as one that can be judged according to generally accepted moral norms of behavior (Treviño et al. 2006). Ethics refers to a set of principles and moral rules of behavior that guide human relationships (Merriam-Webster

[Dictionary](#)) about what is morally good and bad. And leadership involves influence processes within human relationships (Graen and Uhl-Bien 1995; Yukl and van Fleet 1992). Thus, ethics in leadership translate into leader's ethical behavior that make followers to act responsibly toward others, by protecting their human dignity and each other rights and needs (Gini 1998; Guillen and Gonzalez 2001) in human relations. In other words, ethical leadership is the process of leading in a humanistic and socially responsible way (De Hoogh and Den Hartog 2008, 2009) by pursuing ethical goals in business and influencing others in an ethical manner (Eisenbeiss 2012).

The most widely known definition of ethical leadership was proposed by Brown et al. (2005) as “the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making.” Thus, an ethical leader integrates ethics in his/her personal life and in his/her role as an organizational manager.

### Characteristics of Ethical Leaders

Ethical leaders usually are described as being transparent, respectful, and authentic. They are recognized for their integrity, for having altruistic motivations, and for behaving ethically in their personal and professional life (Khuntia and Suar 2004). They are characterized by showing behaviors and traits that reflect fairness and trustworthiness; for having respect to others (Brown et al. 2005; De Hoogh and Den Hartog 2009; Kalshoven et al. 2011b; Tanner et al 2010), making fair and principled decisions, and explicitly communicating and guiding in ethical behavior (Treviño et al. 2003); for being committed to organizational goals (Khuntia and Suar 2004); and also for being concerned for the broader society, that is, by leading in an ethical and socially responsible way.

The main aspect that have been highlighted for most of researches on ethical leadership is that ethical leaders must have ethical motivations,

showing adherence to ethical values, and also consistency in their ethical behavior by demonstrating the pursuit of ethical values across time and situations (Tanner et al. 2010). Internalized ethical values transform into leaders' virtues, which according to Aristotle, represent a set of qualities that make people to act with excellence, by building a good character. In leadership, this good character has been seen as “moral excellence,” (Hendrix et al. 2004) which in turn, makes ethical leaders attractive and credible, because followers admire leaders' ethical behavior (Guillen and Gonzalez 2001). Virtues have also become seen as moral managerial competencies that contribute to leadership effectiveness because it allows the demonstration of excellence in the leadership role (Macaulay and Lawton 2006). According to Melé (2009), what is expected from managers nowadays is to balance making profit (*doing things right*) with leading in a fair way (*doing the right thing*), which are the characteristics of an ethical leader.

Furthermore, it seems that ethical leadership is not only a question of behaving correctly but also motivating others to behave ethically (Brown and Treviño 2006). Moreover, for being effective influencing others ethical conduct, leaders must be recognized as ethical leaders. In this vein, some researchers (Treviño et al. 2000) have proposed that ethical leadership is composed by two distinct but complementary essential behaviors: the moral person and the moral manager. Having individual traits such as honesty and integrity, moral excellence combined with fair decision-making, and doing the right thing, characterizes the moral person. The moral manager implies that the leader makes an explicit effort in assuring ethical behavior by using a reward system to keep standards of ethical conduct at work and also acts as a role model in terms of ethical conduct by regularly talking about ethics and values.

In summary, ethical leaders build an ethical character by cultivating virtues such as integrity, fairness, and temperance and put them in practice in their leadership roles. Ethical leaders exert moral excellence by focusing in ethical purposes such as long-term outcomes that integrate social-economic and environmental results, through

ethical practices by building trustful relationships and making fair decisions (Lawton and Páez 2015). In this sense, ethical leaders contribute to the assurance of corporate social responsibility by pursuing virtuous relationships with all their *stakeholders* (Ehrhart 2004), that is, they work for the good of their stakeholders and attempt to have in mind and protect the interest and needs of the different groups with whom they interact both internally (e.g., employees and board of directors) and externally (consumers, providers, government, community, and media, among others). In this way, ethical leaders build trustful relationships with employees (internal stakeholders) and build long-term and respectful relationship with other people and institutions outside the organization (external stakeholders), including the broader society.

### Antecedents of Ethical Leadership

Within the antecedents of ethical leadership, that is, those factors that are more associated with the perception that a manager leads in an ethical way are individual and contextual or situational factors. Ethical leaders usually have traits as agreeableness (*being altruistic, trusting, and cooperative*) and conscientiousness (*responsible, trustful, and dependable*) (Kalshoven et al. 2011a; Xu et al. 2011). They also show high levels of moral development (*the ability to detect ethical issues and make moral reasoning based on universal principles of justice and rights*), by which they make fair and principled decisions (Schminke et al. 2005; Treviño et al. 2006). Nevertheless, these personality traits explain a small amount of variance in ethical leadership behaviors.

Situational or external factors have bigger amount of impact on ethical leadership behaviors than personality traits. Childhood ethical models and ethical role modeling during leaders' career have a positive influence in the emergence of ethical leadership in organizational leaders (Brown and Treviño 2014). Good role models in terms of ethical behavior (parents and chiefs) provide potential or future organizational leaders

information about how to lead in an ethical manner.

Another relevant contextual factor is organizational ethical climate, which seems to play a key role in the emerging and maintenance of ethical leadership. Ethical climate is about the perceptions of organizational practices that have ethical and justice content (Victor and Cullen 1988). It reflects collective judgments about fairness in the organization (Schminke et al. 2015) and represents employees' beliefs concerning what constitutes right behavior at the workplace (Martin and Cullen 2006). In such kind of environments, leaders feel encouraged to display and develop their ethical leadership style, because it is valued, expected, and supported.

### Outcomes of Ethical Leadership

Ethical leadership is a leadership style that has been associated with positive effects on employees, by enhancing positive attitudes and behaviors at work while diminishing the negative ones in organizations (Bhal and Dadhich 2011; Brown et al. 2005; Brown and Mitchell 2010; Brown and Treviño 2006; Kalshoven et al. 2011b; Mayer et al. 2012; Ruiz-Palomino et al. 2011; Zhu et al. 2004). Positive attitudes and behaviors at work are relevant to organizations and employees, because they reflect employee's good disposition to do the job, which translates in better performance, healthy work climate, and employee well-being.

One of the most important positive attitudes for organizations is job satisfaction, which reflects how satisfied an employee is based on his/her fundamental evaluation of work experiences (Harrison et al. 2006). It has been one of the most studied attitudes in organizations because it is the most related to relevant work outcomes (Judge et al. 2001; Organ 1988; Podsakoff et al. 2000), in terms of favorable behaviors. Satisfaction also has been one of the main attitudes enhanced with the presence of ethical leadership (Brown et al. 2005; Elci and Alpkın 2009; Koh and Boo 2001; Neubert et al. 2009; Okpara and Wynn 2008; Rowold et al. 2009; Tsai and Huang

2008; Valentine and Fleischman 2008; Vitell and Davis 1990), because employees appreciate the good work environment that these leaders create, characterized by fair procedures, trust, and respectful treatment.

Ethical leadership has also shown to be influential on employees' positive behaviors at work, such as helping behaviors, performance, and ethical decision-making (Brown and Treviño 2006; Caldwell and Dixon 2010; Kacmar et al. 2011; Kalshoven et al. 2011b; Kalshoven and Boon 2012; Lu 2014; Mayer et al. 2009; Páez and Salgado 2016; Piccolo et al. 2010; Podsakoff et al. 2000; Qi and Xia 2014). Helping behaviors, most commonly known as "organizational citizenship behaviors (OCBs)," represent those behaviors that serve to the *maintenance and enhancement of the social and psychological context that supports task performance* (Organ 1997) and *in the aggregate promotes the effective functioning of the organization* (Organ 1988). Typical OCBs are helping others with their work, respecting others rights, and being on time for meetings and commitments, within others. These kinds of behaviors arise and/or increase when the boss is an ethical leader, because employees have a clear role model to learn from, and also, they feel motivated to correspond to the good treatment they receive.

Ethical leadership also has shown to diminish negative attitudes and behaviors at work such as dissatisfaction, deviance, counterproductive, and unethical behaviors. It has been found that this kind of negative behavior diminishes and even disappears in units led by an ethical leader (Detert et al. 2007; Mayer et al. 2009; Mayer et al. 2010; Mayer et al. 2012; Newman et al. 2015; van Gils et al. 2015). The main reason is that in most cases, negative behaviors in the organizational context arise as a response of employee dissatisfaction or mistreatment, aspects that an ethical leader do not embrace and makes continuous efforts to prevent in his/her unit.

Another relevant outcome of ethical leadership for organizations is the improvement of ethical climates and cultures (Engelbrecht et al. 2005; Treviño et al. 2003). As ethical climates favor ethical leadership behaviors, ethical leadership also contributes to foster ethical work climates

by promoting ethical values, making ethical decisions, and practicing fairness.

## Conclusion: When Deeds Speak, Words Are Nothing

In general, ethical leadership is related to ethical behavior at work both on the part of the leader and on those people with whom he/she relates (Treviño et al. 2006; Turnispeed 2002). In fact, there is some consensus about that leaders shape the ethical tone of an organization through their own behaviors and decisions (Weaver et al. 2005; Weber 2010), creating ethical organizational cultures and climates. Finally, it has been found that it is a style that is globally valued and associated with leaders' effectiveness, across different cultures (Resick et al. 2006), that is, people around the world appreciate ethics in leadership and respond positively to it by behaving better at the workplace and by being more willing to perform better at job.

## Ethical Leadership and the LGBTQ Homeless Youth Crisis

### Introduction

During the 1960s, it was unthinkable that the lesbian, gay, bisexual, and transgender (LGBT) movement would have evolved to where it is now, early in the twenty-first century. Indeed, the widespread *pathologization of gender variance*

(denigration of alternative expressions of gender identity), along with countless forms of oppression—everything from targeted raids on bars and other social gatherings to exclusion from government employment, loss of employment, ridicule in hackneyed and stereotyped media portrayals, public shaming, and the destruction of families due to “outings” (forced exposure) and violence were routine for the LGBTQ community during the 1950s and 1960s (Katz 1992; Johansson and Percy 1997; Stein 2001; Solomon and Patrick 2015). Today, the community has much to celebrate, including much greater and more positive exposure in popular culture and the media (Lawrence v. Texas 2003; Jacobs et al. 1997).

It was not until the Stonewall movement of the 1960s that LGBT persons started to fight against the political and societal oppression of the day (Franke-Ruta 2013). This was a watershed moment not only for the LGBT community in the USA, but in many other parts of the world as well. It must be mentioned here that the Stonewall movement or the Stonewall riots are often referred to as the modern gay liberation movement, beginning June 28, 1969 (Johnson et al. 2018; Johnson 2017a, b).

The history of modern LGBT rights was accompanied by great challenges and great victories such as the federal legalization of same-sex marriage in 2015 within the USA. Patricia Hill Collins (2007) called transversal politics and coalition building anchored in engaging multiple group standpoints to advance social justice through intersectional knowledge projects. This was indeed the case with the advancement of the LGBT movement within the last several decades (Johnson 2017a, b). However, while the US legalization of same-sex marriage is epic, and allies of all types have assisted the movement, there are still many issues that the LGBT community must work to overcome. For example, the plight of many transgender people to be accepted is an issue which is still looming large. This acceptance should not only come from the greater community but within the LGBT community as a whole (Johnson 2017a, b).

One of the most looming issues to be dealt with is the matter of LGBT homeless youth (Johnson

et al. 2018). During the Stonewall movement what is not often acknowledged or addressed was the large amount of LGBT homeless youth frequenting the Greenwich Village (aka the village) area of New York City, which is where the Stonewall Bar was located and continues to be located today. The LGBT homeless youth and drag queens were the ones who fought back against law enforcement. The drag queens decided that they had enough of being harassed and blackmailed by law enforcement as this was every week occurrence (Oliver and Ali 2019).

Therefore, one would assume that the issue of LGBT homeless youth is chronic and has been around for decades. Still, the issue of LGBT homeless youth is a troubling one and has basically been woefully overlooked by many LGBT leaders and political leaders as well. Here LGBT youth is defined as identifying as LGBT, roughly 12 to 24 years of age, and displaced from their home by parents. This displacement, also referred to as “being kicked” out, has everything to do with gender identity and or sexual orientation (Abramovich 2012). According to the True Colors Fund (<https://truecolorsunited.org/our-issue/>), some parents cite religious convictions for abandoning their LGBT child. Other parents evicted their LGBT child from the home due to biased beliefs from societal constructs. Despite the reasons, there is a disconnect between the LGBT youth and their parents. LGBT youth aging out of the foster care system may also lead to housing displacement. It is estimated that 7% of all youth are homeless in the USA. Of the 7% homeless youth, it is widely believed that at least 40% are LGBT (<https://truecolorsunited.org/our-issue/>).

## Consequences for LGBT Homeless Youth

There are several troubling outcomes for LGBT youth who experiences chronic homelessness (Johnson et al. 2018). The first consequence happens because the youth is forced to find shelter wherever they can (Montano 2019). This would include sleeping on park benches, sleeping in parks, and/or any other places that maybe free.

All of these sleeping situations make it difficult for the LGBT homeless youth to attend school and plan for their future. Cis females (women born biologically female) are put in a difficult situation due to the need for feminine hygiene products needed generally once a month. Youth are often harmed living on the streets. Predators look at youth sleeping in the park as easy targets and may try to molest them while trying to sleep on a park bench or in the grass (Montano 2019). This situation is challenging for any homeless youth, especially for gender-nonconforming, nonbinary, and queer youth, because they are looked upon as easy prey. Though this situation does not only apply to LGBT homeless youth. Secondly, homelessness for many LGBT youth may lead to prostitution. Oftentimes these youth have no resources or outlets for legitimate means in order to make a living either because they have little formal education and/or are too young to be employed. Therefore, they rely on their body to hustle for money. Unfortunately, sex work could potentially lead to HIV/AIDS or other sexually transmitted diseases (STDs), and death. The television show *Pose* offers viewers a true-to-life view of how it is for LGBT youth, often of color, windup living on the streets, and often having to engage in unsafe sexual practices while prostituting themselves for money (Montano 2019; The Williams Institute 2015).

Substance abuse is also a consequence of LGBT homeless youth (National Network for Youth 2019). Resulting from living on the streets and couch surfing, these individuals are introduced to drugs as a way of coping with the stress that comes from being homeless and LGBT. These drugs include meth, cocaine, marijuana, and alcohol, to suggest only but a few substances. Studies indicate that homeless youth are three times more likely to try these substances and 18 times more likely to try crack cocaine than their peers who experience a stable home environment (National Network for Youth 2019).

have not been many federal dollars appropriated for the situation (Johnson et al. 2018). Most of the assistance for homeless LGBT youth has come from nonprofit organizations and NGOs. It is a missed opportunity for societal systems and local communities to ignore this crisis (Chapin Hall 2017; Kirk and Pill 2018).

The next section concludes this topic on LGBT homeless youth by suggesting three policies that may assist in at least reducing homelessness for LGBT youth (Kirby 2008).

1. It is doubtful that a national program could be enacted anytime within the next couple decades. Therefore, a reasonable solution may come from the states. Here the states can provide funding for greater amounts of shelters specially for LGBT homeless youth. At these shelters youth can finish their GED diploma, and take classes towards earning their college degree or a vocational career. The shelters should also employ a trained counselor to work with the youth as many of them may be suffering from trauma. There should also be access to health coverage. This is especially important for transgender youth who are in the process of transitioning and maybe in need of hormone therapy.
2. State leaders need to consider homeless LGBT youth important the same way as other health situations are considered in this country, such as crack cocaine. A failure to acknowledge homeless LGBT youth as a crisis feeds into the myth that very few people care about this topic.
3. The matter of LGBT homeless youth should be a call to action for public administrators and anyone concerned with the well-being of youth in general. Society can ill-afford to leave one homeless LGBT youth uncared for as this person may have the potential to be a US president, university professor, software engineer, or thought leader.

## Ethical Leadership Need

The issue of homeless LGBT youth has been insufficiently addressed nationally, and there

## Introduction

Ethics concerns the moral values that guide human decision making and behavior. Ethics aims not merely to describe human conduct but to set out what it should be. Many human decisions and actions are based on moral principles. For example, can we justify deviating from universal standards of hiring for the sake of promoting equality? Can we prioritize profit over customers' well-being? Do we form or terminate a strategic alliance with a partner demonstrating racism in its resource allocation policy?

Ethical literacy training focuses on developing awareness of moral issues and developing decision-making and behaviors that take into

account moral considerations. Ethical literacy can be developed independently, but it is often done in a structured group, as part of formal training or education. Ethical literacy is considered particularly important for leaders because of their influence over followers and their power to reshape social and organizational realities.

Over the years, the concept of leadership has been given many definitions (Shepard et al. 1997). Leadership is frequently conceptualized as social influence of the leader over followers, a process that is change-oriented around a mutual vision and goals grounded in values (Shepard et al. 1997). Leadership development may be centered on personal aspects (one's knowledge, experiences, skills, identity, information processing, personality, self-learning and development abilities, etc.), the interpersonal ones (social skills, such as communication and networking, and authentic relational abilities, such as openness, trust, and modeling), or both (Day et al. 2014).

This entry focuses on formal leadership development, where individuals aspiring to reach managerial positions or already in junior or middle-level management positions seek to develop their leadership and managerial knowledge, attitudes, and skills in a structured and organized program. Formal leadership development can take the form of an ongoing professional development program within the organization or outside of it, as part of a higher education certificate or degree.

## Ethical Literacy

Ethical literacy aims to develop the components that drive moral cognitive processing. It targets two components: *ethical sensitivity* and *ethical judgment* (Hannah et al. 2011). Rest et al. (1999) defined moral sensitivity as “interpreting the situation, role-taking how various actions would affect the parties concerned, imagining cause-effect chains of events, and being aware that there is a moral problem when it exists” (101). Ethical judgment is about “the cognitive processing of moral dilemmas – those complex intellectual choices between right versus wrong, or

right versus right” that mark one's intentions to act (Hannah et al. 2011: 664).

Scholars further break down ethical judgment into two components: *ethical logic* and a *dominant ethical disposition* (Bartels et al. 2014; Berkovich and Eyal 2020). Ethical logic is a key factor in ethical judgment. In a reality of multiple ethical considerations, in the case of each dilemma, people form a complex array of interconnections between various ethical perspectives, which reflects their trade-offs between competing moral values (Bartels et al. 2014). For example, some may regard procedural justice and individual care as highly conflicting, whereas others may consider them to be less so. The former are more likely to commit to one ethics over another when encountering dilemmas that embody these two ethical considerations (e.g., whether in an economic downturn to fire the most recently hired employee despite being the sole provider and expecting a new baby), whereas the latter are more likely to switch their stand in dilemmas that demand choosing one option (i.e., either to support procedural justice or to support individual care).

The second component of ethical judgment is demonstrating a dominant ethical disposition (Berkovich and Eyal 2020), which refers to an individual inclination to prefer specific ethical consideration in various ethical conflicts. For example, an individual has a dominant ethical disposition toward procedural justice if he/she chose it repeatedly in dilemmas over other considerations (e.g., utilitarianism, care). An individual may have several dominant ethics that are manifest in his/her choices, and which may form one of two ethical profiles. For example, individuals who have a more transformational leadership style display an ethical activism profile, that is, high use of social critique, individual care, and professional considerations to resolve ethical dilemmas. By contrast, individuals who have a more transactional leadership style display a profile of ethical conformism, with high use of procedural justice, utilitarianism, and local community preferences in resolving ethical dilemmas (Berkovich and Eyal 2021).

Ethical literacy is manifested at the individual level, but each individual's ethical literacy is the product of his/her sociopolitical positioning and context. For example, among majority group members, a lack of statistical correlation was found between social critique and utilitarianism, whereas a significant negative correlation emerged in members of marginalized minority groups (Eyal et al. 2021). This means that there are few individuals belonging to a marginalized group who choose to transform the social order and at the same time adopt utilitarianism to solve moral dilemmas, whereas many more individuals in this group view these two ethical considerations (i.e., social critique and utilitarianism) as being coming at each other's expense.

### **Types of Formal Leadership Development Programs**

The literature proposes four categories of leadership preparation programs: traditional, attitude development, activist, and neo-traditional (Berkovich and Eyal 2020). Traditional leadership development programs emphasize the advancement of technical skills (Berkovich and Eyal 2020). In these programs, students' self-identity is seldom addressed directly or challenged by the content and instructional strategies. Attitude development leadership programs emphasize the advancement of reflective consciousness and often expose students to various philosophical perspectives and case study analyses to nurture students' personal view on leadership in general and their leadership style in particular (Berkovich and Eyal 2020). Activism leadership development programs emphasize the advancement of action-oriented skills for students who have been pre-selected according to their deep commitment to a specific set of values, often by demonstrating a proven record of action (Berkovich and Eyal 2020). In recent decades, in light of the growing awareness of the social responsibility of organizations and of growing critique of traditional leadership development programs over their lack of effect, there has been a rise in the neo-traditional type of leadership

programs (Berkovich and Eyal 2020). These programs combine elements of nontraditional programs that include such strategies as mentoring and peer learning, and a quest for leaders' identity creation. Unlike traditional leadership development programs, attitude development, activism, and neo-traditional leadership development programs aim to directly explore students' self-beliefs, values, and self-identity, as well as their effect on their leadership identity and behaviors. Ethical literacy training occurs mostly in attitude development, activism, and neo-traditional leadership development programs. In these types of programs, we find less frontal teaching and more active learning (i.e., peer learning, in which students reflect about their values and actions), and situated learning (i.e., case- and problem-based teaching, where students are called to reflect on real contexts in which the existing and new knowledge are applied) (Berkovich and Eyal 2020).

### **Ethical Literacy Training in Formal Leadership Development**

Ethical literacy development is a process of communication between lecturer and students, and between students and their peers, which aims to encourage new insights of students into social and professional life. These insights in turn help students develop greater awareness of ethical aspects and to commit themselves to the use of moral values in decision making and behaviors. Ethics education often aspires also to provide students with an opportunity to take the time to work through their personal and professional codes and spend extensive time evaluating and exploring possible conflicts between their own values.

Ethical literacy training includes imparting and discussing moral philosophies that outline what is a "good" or "proper" way of life. Ethical literacy education can assume various forms: some set out to amplify students' sensitivity to moral elements at work (what may be termed as the "ethical toolbox" approach); others aspire to direct students toward the "right" codes of conduct and affect their willingness to rely on certain moral

values in forming their decisions (what may also be termed as the “ethical codex” approach).

In general, for various reasons, the “ethical toolbox” approach is more dominant in formal leadership development, specifically in higher education. According to this view, training aims to transform students’ ethical viewpoint but not in a manner that marks the importance of a given limited set of moral values and behaviors. Programs based on the “ethical toolbox” approach often include students’ self and group reflections about ethical values, reflections on the students’ biography, and its effect on their ethical conduct at work. In the course of the program, students read texts on ethics and morality, and analyze case studies, and their ethical implications. The common conception today is that managerial and leadership situations are complex and multifaceted. Therefore, the assumption is that students should be familiar with multiple ethical perspectives (e.g., procedural justice, individual care, utilitarianism, and social critique) that they can use when exploring a given moral dilemma. The logic behind this notion is that when multiple ethical perspectives are considered simultaneously and systematically, the best ethical decision is reached as the solution.

Ethical literacy development can be embedded in all the courses in the program or it can be presented as a standalone course. Some scholars argue that embedding ethics in all courses exemplifies more clearly the integration of ethics in all professional aspects. Others suggest that a standalone course, dedicated exclusively to ethics, helps delve deep into the issues and signals the importance of the topic (Berkovich and Eyal 2020). The more common practice is the standalone ethics course.

Leadership development programs can have diverse admission policies that might have strong relationships with their ability to develop ethical literacy. These admission policies can take one of several forms: open admission, selection of applicants based on their moral reflexivity or moral inclinations, or selection of applicants based on their professional initiatives and the manner in which they manifest moral principles.

Open admission is the most outreaching and simple way to operate, but it has been criticized as being susceptible to admitting students with no ethical understanding of the profession, and even students with ethically problematic conceptions of the profession (Berkovich and Eyal 2020). Open admission may be part of neo-traditional leadership development programs, but it is rare in attitude development and activism leadership development programs. The latter often use various selection measures to compare applicants’ a priori ethical understanding and views (Berkovich and Eyal 2020). Among these measures, one can find personal interviews, essays of applicants, professional portfolios, group simulations, and the use of psychological assessments.

### State of the Research on Ethical Literacy Training Effectiveness

Despite the great interest in developing the ethics of trainees, research knowledge is lacking. Among the two most common practices in ethics training evaluation are trainees’ subjective experiences during training (28%) and versions of the Defining Issues Test (DIT) (15%) (Steele et al. 2016). Trainees’ subjective experiences are affective reactions, such as satisfaction, views about the utility of training, and views about efforts demanded by training materials. The DIT is a multiple dilemma test based on Lawrence Kohlberg’s theory of moral development. According to Kohlbergian logic, there are several ethical stages (legal rights → social contracts → universal principles), and the last is the most ethically worthy stage. DIT is one of the oldest and most popular measures of ethics, but it has been greatly criticized for reframing masculine, Western, and liberal values as more ethical (Steele et al. 2016).

Reviews of the evaluation and effectiveness of ethics education indicate some of the key problems in the current research (e.g., Berkovich and Eyal 2020; Steele et al. 2016). First, part of the literature focuses on the outcomes of established leadership development programs and not on the consequences of the ethics education module.

Second, some studies use graduates' experiences and behaviors, although the connection of these elements with the goals and syllabus of a given ethics education course has not been established. Third, many evaluations use trainees' reports of their subjective experiences during training as a proxy for the degree to which their moral judgment has been transformed. This is problematic because social desirability and self-enhancement biases possibly play a part in this kind of self-report. Fourth, some works did not pay sufficient attention to the students' preliminary background and ignored students' self-selection to programs. For example, individuals who favor social critique ethics and care ethics are more likely to go into nongovernmental leadership development. In light of these biases, scholars recommend to design a study that would include pre- and post-ethics training tests of participants who undergo training, with a control group that does not undergo the ethics training (Steele et al. 2016).

## Ethical Management of Psychiatric Care of Children and Adolescents

Geraldine S. Pearson  
UCONN Health, Farmington, CT, USA

## Synonyms

Autonomy; Beneficence; Fidelity; Justice; Nonmaleficence

## Definition

Ethical management of psychiatric care involving children and adolescents is defined as clinical management that always considers the emotional, cognitive, social, and physiological development

of children and adolescents. Children and adolescents are considered a vulnerable population given their varying dependence on the adults in their lives including caregivers, parents, and other family members. They need protection in clinical care situations and when involved in research (Koelch and Fegert 2010). Psychiatric care management can occur in many different settings but is essentially a psychiatric professional providing treatment services to a child and adolescent population and their family. The basic principles of ethics can be applied to nearly all care situations and environments.

When optimizing all aspects of functioning, understanding the individual's particular developmental stage must be considered along with the level of disorder, acuity of symptoms, psychosocial situation, and family structure. Ethical management of this population is a complicated process for the psychiatric provider given that all children and adolescents are dependent and usually legally managed by an adult parent or guardian. Influences can include the legal status of the child, the setting where care is being provided, the guild of the provider, i.e., physician, nurse, psychologist, or social worker, and the emergent nature of the child or adolescent's need for care.

## What Are the Issues?

The basic principles of ethics when treating children and adolescents include the following:

**Autonomy:** Defined as the individual's involvement as the agent of decision-making, considerations of autonomy also include agency, or an awareness of oneself, desires, and intentions. It includes independence or the absence of coercion and outside influences and rationality, or the capacity for reflection on own desires.

**Respect for an individual's autonomy:** This principle has underlying themes of privacy, confidentiality, valid consent/assent, and refusal of treatment. These concepts are complicated when the individual is a child or adolescent.

**Nonmaleficence:** Defined as the duty to do no harm to patients, this concept is the cornerstone of ethical practice and behavior of individuals

providing care. It involves an awareness of evidence-based practice, normative treatment, and standard of psychiatric care for a pediatric population.

**Beneficence:** Involves taking active steps to contribute to the welfare of a child or adolescent. This involves weighing the benefit-risk ratio of various treatments and interventions and planning interventions according to the needs of the individual and family. It can involve advocating for a particular treatment or working closer with a child welfare agency to insure that a child is safe. It involves an awareness of systems and their influence on the child or adolescents functioning.

**Fidelity:** The caregiver is always in the service of the best interests of the child/adolescent/family. This must take precedence over any other competing interests including guardians, insurance companies, school systems, industry-related companies, or colleagues. The child's needs must have primary importance.

**Justice:** This is the process of offering fair treatment to all. The caregiver provides the same level of care to an individual or family regardless of socioeconomic level, race, ethnicity, gender, or family constellation. While this care might be tailored to an individual's language needs or ethnicity, the quality of care is not influenced by these individual factors.

All of these factors are taken from the American Academy of Child and Adolescent Psychiatry, Code of Ethics. Although applicable to children and adolescents, this is adapted from the Principles of Medical Ethics of the American Medical Association and the Code of Ethics of the American Osteopathic Association (AACAP 2014).

## Authoritative Ethics Documents

In addition to these basic principles outlined in child psychiatry, there are overarching principles that also influence and govern ethical psychiatric care of children and adolescents on an international level. The Universal Declaration on Bioethics and Human Rights was adopted in 2005 by the United Nations Educational, Scientific and Cultural Organization (UNESCO). Member states

committed to respecting and applying the fundamental principles of bioethics (UNESCO 2005). The Declaration was aimed at putting forth the rules governing respect for human dignity, human rights, and fundamental freedoms. The Declaration notes the interrelation between ethics and human rights. This Declaration was a supportive foundation for the principles governing ethical issues in child and adolescent psychiatry.

The Declaration identified a number of other factors as guiding principles including the basic recognition that all persons have unconditional worth, all individuals are worthy of equal treatment in a similar situation, and caregivers will use discretion when reviewing special circumstances of particular individuals. A respect for cultural diversity and pluralism occurs and recognizes that ethical standards must be interpreted according to the cultural norms or social groups and societies.

The Belmont Report, published in 1979 by the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, offers guidelines pertaining to protection of human subjects in research. This document introduced the concept of vulnerability in populations (National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research 1979). Other documents dealing with protection of human subjects include the Council for International Organizations of Medical Sciences (CIOMS) guidelines and the Declaration of Helsinki. These all addressed ethical treatment of individuals (Zagorac 2016).

Non-discrimination and non-stigmatization prohibits discrimination while working towards elimination of stigma. It is recognized that doing this requires social transformation, an understanding of ethics, and ongoing ethics teaching.

## **Principles of Ethics Applied to Child Psychiatry Research and Treatment**

Individuals are not seen as a means to a scientific end and can make their own decisions about care. This identifies concepts of ethical research involvement, informed consent, and the ability for the individual to withdraw from a study at

any time. Parents or guardians also have the ethical right to withdraw their child or adolescent from treatment or research at any time. Privacy and confidentiality guarantees a control and respect of personal information. Shared information is private and only shared with consent and understanding of the purpose of this sharing. Vulnerable groups, including children and adolescents, must have access to health care worldwide.

The concept of social responsibility considers the wider social dimension of the scientific process by specifying five elements of universal priority. These include access to quality health care, access to adequate nutrition and water, improvement of living conditions and the environment, elimination of marginalization and exclusions of persons on the basis of any ground, and the reduction of poverty and illiteracy (Pearson et al. 2015).

Benefits from advances in scientific fields such as biology, genetics, and medicine are ideally available to all. Finally, the Universal Declaration on Bioethics and Human Rights notes that human beings are an integral part of the biosphere and should engage in responsible management to ensure life for future generations (UNESCO 2005).

The key to ethical psychiatric management of children and adolescents begins with the educational process for those who provide care. Understanding the broader Declaration and the basic ethical principles outlined by the American Academy of Child and Adolescent Psychiatry (AACAP) and the American Psychiatric Association (APA) is essential to understanding the type of psychiatric care that can be ethically provided to a pediatric population.

Applicability of ethical practice when providing psychiatric care to children and adolescents requires diligence and an attention to detail. Providers are encouraged to identify and address their own issues of countertransference that might impinge on applying ethical concepts. Providers must choose employment in care environments that support ethical standards. Finally, providers must be willing to use the broader psychiatric community of peers to process and discuss the various ethical dilemmas that will arise in psychiatric treatment of children and adolescents.

## Ethical Peer Review

Charon A. Pierson  
Committee on Publication Ethics, Gilbert,  
AZ, USA

## Synonyms

Blinded review; Clinical peer review; Double-blind review; Expert refereeing; Open peer review; Post-publication peer review; Review board; Scholarly peer review; Single-blind review

## Definition

Peer review is a systematic process of evaluation of work by experts in the relevant field. To be a peer, the experts must be similarly qualified to the originators of a work (e.g., scholars in the same discipline, professors of the same rank, practitioners in the same discipline). The work

evaluated could be scholarly manuscripts, grant applications, conference submissions, data, or the clinical activities of professionals such as physicians or teachers. A primary objective of peer review is to improve the quality of work by providing impartial feedback to the originators or implementers of the work. Expectations for the evaluation should be clearly stated but reporting formats can vary from checklists, written summaries, direct observation of work, or other methods appropriate to the work and the platform on which the evaluation is conducted. Although peer review is considered an essential element of scientific publishing and awarding of grants, widespread implementation and acceptance of peer review did not occur until the 1970s (Baldwin 2018).

## What Are the Issues?

Ethical peer review depends upon trust, transparency, and accountability. Breaking those bonds of trust causes harm to everyone involved. The management of the peer review process must be fair and those who perform the reviews must act responsibly, without prejudice or conflict of interest. Biased or compromised peer review can prevent an author from receiving funding, publishing an article and receiving credit for work done, or cause reputational harm to the authors, the institutions involved, or funding sources. Precluding justified publication could cost an author a job or academic advancement, actions that have detrimental, long-term effects. Peer reviewers are principally volunteers who rarely receive credit for the reviews they perform. Although normally considered a pre-publication activity, post-publication peer review has become more common and accessible. Models or frameworks for peer review include elements of timing, identification of the reviewers and/or the authors, facilitation and mediation of the review process, publication of reviews, and ownership of peer review comments (COPE Council 2017). Training of peer reviewers is sporadic, and the quality of reviews may be unreliable. Authors who receive constructive critique in reviews of their

work benefit from the feedback as they revise and improve their submissions. The scientific community gains a degree of assurance that the science behind a publication has been vetted and determined valid. Funding agencies are reassured that the money awarded will be spent on worthwhile projects.

*Issues in journal publishing.* Editors are normally in charge of the peer review process at a journal. They assign reviewers to a manuscript, monitor the progress of the reviews, read the returned reviews, assess the reviews, and base a decision on the reviews as well as on the scope and vision of the journal and other input from the editorial board. The editor then communicates the decision to the submitting authors. These actions are based on trust: the editor trusts the reviewer has the time and expertise to do a competent review, has done a thorough review, and does not have any competing interests or biases that influenced the report. Editors trust that peer reviewers have provided legitimate contact information related to their identity, workplace affiliations, and actual performance of the review. In turn, the peer reviewer trusts that the editor will maintain appropriate confidentiality and will not substantively alter the submitted review. When any part of that trust is violated, the system cannot function optimally. Journal websites should be truthful in their claims about peer review.

The typical peer reviewer for a journal or a grant is someone who has published in the journal or received a grant from the organization. There is not necessarily any mandated training or formal mentoring for novice reviewers. It follows that clear instructions should be available for peer reviewers and that those reviewers read and follow the stated instructions. Because peer review is a volunteer activity, timeliness is always an issue for peer reviewers and editors. There is typically an agreement between the editor and the reviewer that a review be completed within a specific time frame. An agreement to complete the review implies an ethical duty to fulfill that requirement, including the scope of the work and timeliness of completion. Authors await the results of peer reviews that inform the decision of the editor, and delayed responses mean a delayed

publication. Because reviewers are solicited from the peers of the authors, there are many opportunities for conflicts of interest to occur. Working in the same field, some reviewers and authors will likely be competitors, thus, declarations of competing interests are essential. Reviewers must also respect the confidentiality of the process and not use or share any information from the submitted work to advance their own work or to cultivate favor with another person or group working on a similar project. Peer reviewers are obligated to report any suspicion of misconduct uncovered in the work, and editors are obligated to follow through on ethical issues whether that discovery comes before or after publication. The *COPE Ethical Guidelines for Peer Reviewers* (COPE 2017) describe important considerations for peer reviewers and there are some online training programs to help peer reviewers become useful reviewers (see for example, the QUT Office of Research Ethics and Integrity peer review training at <http://www.orei.qut.edu.au/integrity/peer-review.jsp>). Reviews can be critical but should always be respectfully conveyed.

Models of peer review vary widely and if reviews are conducted ethically and transparently, there are many acceptable options. For most journals, peer review is conducted on an electronic manuscript submission and review platform designed to prevent unethical behavior (e.g., authors are not able to manipulate the selection of or revise the reports submitted by reviewers). The COPE website has many examples of the ethical violations that can occur with peer review processes and decisions ([https://publicationethics.org/cases/?f%5B0%5D=im\\_field\\_classifications%3A2779](https://publicationethics.org/cases/?f%5B0%5D=im_field_classifications%3A2779)). The *COPE Ethical Guidelines for Peer Reviewers* (COPE 2017) explains features of the various models of peer review but does not recommend one model over another. Models are commonly referred to as follows: double-blind – neither the author or the reviewer are identified during the process; single-blind – the reviewer is given the names of the authors, but the reviewers are not identified to the authors; open – the authors and reviewers are identified to each other, and reviews may be signed and published along with the final article. Reviewers should

understand the model under which they have accepted a review assignment. Even if a review is conducted under an open model, reviewers should not publicly post their reviews on another public site unless that is specifically allowed by the journal. Post-publication commentary can occur on public websites, in blogs, on social media, and via letters to the journal editors. Rules of civil discourse should prevail no matter where the commentary occurs. Editors may edit reviews or commentary to standards of politeness.

*Issues in other types of peer reviews.* Not all peer review is carried out on journal articles or books. Regardless of the type of review or the method of conducting a review, the same ethical principles apply. Fair treatment under transparent conditions should be the norm. There will likely be new types of peer review evolving that will require clear and transparent guidelines.

Although reviews of grant applications are similar to reviews of scholarly publications, there is often an element of determining an award amount. This financial aspect of the review process may require additional expertise in evaluating underlying processes in place for grants management, quality assurance of a new program, and institutional reputation. Grant review panels may be specifically convened based on these additional criteria and there will be much more input from the staff of the granting agency. Declarations of competing interests are required for transparency of the process.

Peer review of professionals is a performance review of clinical or technical work, the findings of which can influence an individual practitioner's job advancement, income, or requirements for additional education or supervision. Professional review panels are normally administered by a subcommittee of an institution, such as a hospital, school, or professional society. There are similar expectations regardless of the profession that the process be fair and impartial and that the individual under review receive a constructive report of any needed improvements.

A review of scientific data may or may not be conducted along with an article submission. If data review is a necessary part of a peer review for a research manuscript, that requirement should

be made clear to the reviewer and the reviewer should only accept if he or she has relevant expertise in data analysis. There is a recent trend towards requiring deposition of data into a third-party public data repository outside of the journal and the publishing house. Confidentiality on the part of reviewers when handling data from a third-party repository is essential. Likewise, there should be clear and transparent information from the data repository about the handling of the data. This is likely to become a bigger issue in the future as more journals require data access for reviewers and even readers; however, there are many technical and ethical issues to be sorted before the practice is widely adopted.

Book acquisition is a part of publishing, but books may not be reviewed in the same manner as a journal submission. There are many more steps in reviewing books, including the early proposal, a financial review, content review among other possibilities. Book proposals may originate from within the publishing company by an acquiring editor or be submitted by an interested author. The process is largely driven by the acquiring editor and a positive outcome is dependent on a financial review from the company. Technical or non-fiction books, including academic textbooks, undergo one or more rounds of content review or fact checking. Book editors might not provide a lot of constructive feedback on rejected proposals, but once a book contract is signed, it is likely the editor who provides much of the developmental critique rather than peer reviewers. A final step could be review by potential adopters of the book, especially textbooks and workbooks. (For more extensive information on book acquisition and publication, see Ginna 2018).

## Introduction

This entry reviews ethical performance and health from multiple, interrelated angles. It first discusses the effects of health on ethical performance at the micro (individual) level, and subsequently considers the consequences of ethical performance on health on a macro (organizational and societal) level. The philosophy behind this dual perspective is to demonstrate the reciprocal effect of both phenomena onto each other.

## The Influence of Health on Ethical Performance

Numerous studies have determined the mind–body connection where the activity of one triggers responses from the other. This connection confirms the belief that when we neglect, stress, or deprive the mind of optimal health functioning, the body suffers the consequences in some shape or form, vice versa. Eating habits, mental patterns,

stress, and relationships are just a few factors that can influence our mental and physical well-being. These factors can also affect our ethical performance in life; the way we perceive things, whether and how we consider ourselves and/or others, and whether or how we take ethical and legal matters into consideration. In the sections below we will briefly review the correlation between mental and physical well-being and ethical performance from each aspect.

## Mental Well-Being

Mental health is vital to a person’s ethical performance in life. “Brain functioning changes sensations into perceptions and thoughts into actions. Reverberations in brain circuits lead to conscious experience; these reverberations also structurally alter the brain. Stressful experiences change brain regions involved in memory and emotions, impairing memory and increasing anxiety and aggression” (Travis 2009, p. 31). McEwen (2006) underscores that the brain is the key organ that determines what is threatening, and therefore, stressful, while also controlling the behavioral and physiological responses thereto.

Work environments can be overwhelming and stressful, causing some workers to engage in the use of substances in order to manage the pressure. Alcoholic and narcotic substances aim to numb a person’s undesirable emotions, which are created and located in the amygdala, an almond-shape set of neurons located deep in the brain’s medial temporal lobe. Yet, although drugs and alcohol may help numb adverse sentiments, they also affect other parts of the brain, including the frontal lobe, which is considered the brain’s executive center. This center controls our abstract thinking, rule acquisition, planning, and flexibility in responses, including rule shifting, while it also triggers suitable actions and inhibits unsuitable ones (Crews and Boettiger 2009).

A person whose frontal lobe and executive functions are suppressed by substances will be more likely to engage in inappropriate, or unethical, actions than one whose frontal lobe functions are not affected. According to Crews and Boettiger (2009), the frontal lobe is also responsible for weighing consequences of future

actions. When the frontal lobe and its executive functions are affected, the brain stem tends to take over. The brain stem is the most primitive part of the brain, responsible for basic body functions such as breathing, heart rate, blood pressure, and consciousness. When the brain stem takes over, a person no longer considers the consequences of behaviors, and resorts to survival instincts instead. The use of substances as coping mechanisms can result into addictions, where tolerance builds and more substances are required. Once an addiction is formed, the person's mental focus will center on a substance-induced escape, which could lead to less focus and less ethical behaviors in the workplace. Furthermore, during an inebriated episode, an addicted person experiences a loss of frontal lobe function and increased impulsivity (Crews and Boettiger 2009), which rarely allows for the consideration of risks tied to his or her behaviors, hence decreasing his or her concerns about behaving morally responsible.

Those who do not use alcoholic or narcotic substances may suffer mental health issues due to personal and work-related factors known to cause stress. Stress has a similar effect on the brain as do substances in regard to how it impacts the frontal lobe. Stress produces a hormone called cortisol. Although not harmful when generated in moderate levels, too much cortisol can have negative and sometimes long-term effects on the brain.

Stress can disrupt synaptic regulation (the ability of nerve cells to pass electrical or chemical signals to others), which leads to decreased sociability and avoidance of interactions with others (Bernstein 2016). Stress affects brain regions such as the hippocampus, amygdala, and prefrontal cortex. When stress hormones are released, the brain responds by undergoing structural remodeling, which alters behavioral and physiological responses (McEwen 2006). According to McEwen, functional imaging revealed smaller hippocampal volume in stress-related conditions. Since the hippocampus is the brain's memory center, stress levels can affect a person's memory in both simple and complex tasks. This can lead to decreased productivity and other problematic personal and work-related behaviors. Furthermore,

chronic stress is linked to a reduction in size of the brain, specifically shrinkage of the prefrontal cortex, the area responsible for memory and learning (Bernstein 2016). The prefrontal cortex is also responsible for planning complex cognitive tasks, personality expression, and moderating social behaviors. Substance abuse and stress can temporarily suppress prefrontal cortex functioning, which increases impulsive behaviors. Impulsivity in the workplace can result in immoral conduct, such as assault and theft.

As mentioned earlier, stress levels can also affect the amygdala. This may happen when stress produces dendritic growth in neurons in the amygdala, causing a person to become more emotionally reactive, which can affect ethical decision-making and conduct in the workplace (McEwen 2006). According to Jones (1991), ethical decisions are defined as decisions that are both legal and morally acceptable to the larger community. An increase in impulsive and emotionally reactive behaviors makes it more challenging for the brain to consider decisions that are both legally and morally acceptable to others.

### Physical Well-Being

The notion of physical well-being has long been dictated by the general perception, and the way this perception is formed. Whereas an individual, especially a woman, used to be considered physically well when plump in the nineteenth century, today, the epitome of health is slimness. Being slim is, indeed, often the way to go in order to stay clear from health issues such as high blood pressure, increased cholesterol, and diabetes, but for some people, it can become an obsession that far exceeds just hitting the gym on a regular basis. Especially young people are often victimized by their desire to meet contemporary standards, upon which they may develop compulsive behaviors, such as eating disorders. Eating disorders often derive from dissatisfaction, insecurity, or a sense of inferiority within a person about the way he or she looks. While physical in manifestation, eating disorders are often considered "mental disorders" and there is an assumption that they often impair general functioning (Bloodworth et al. 2017). Such disorders can intensify a disconnection

between mind and body and fortify feelings of shame and isolation (Starkman 2016).

Factors that should not be underestimated in their influence on people's body dissatisfaction are television, social media, and peer competition (Ferguson et al. 2014). The media-marketing platform, in particular, seems to have taken control over the eating habits of many people, especially younger ones, rendering the conventional reliance on physiological hunger of little value (Forgács et al. 2018).

There are several ethical concerns to be distinguished in this context, starting with the potential immorality of media and peers to make people feel inferior in their normal state. Additionally, there is the concern of potential increases in immoral behavior from those suffering from longitudinal malnourishment due to ongoing food deprivation in order to meet generally accepted physical standards. Malnourishment is known to lead to attentional dysfunction and impulsiveness, diminished ability to adapt to stressful situations, susceptibility to affective disorders like anxiety, and diminished motivations and exploratory behaviors (Mendoza-Salunga 2004). This circles back to the earlier explained survival mode (taking over of the brain stem), in which moral considerations become the least of a person's concerns.

In a more general sense, physical well-being could be considered a matter of healthy living, represented through care of one's body mass index, regular exercise, mindfulness toward dietary restrictions, and refraining from unhealthy habits such as smoking, alcohol, or drug abuse. Unhealthy lifestyles and the resulting physical diseases are damaging not only to the affected individuals, but also to their workplace and the economy at large. Unhealthy people usually require more time off, therefore placing the burden of completing their work on others, who then get exposed to greater pressure and stress. In that regard, they form a drain to their workplace and the economy in which they perform. Considering Pettit's (2001) *Theory of Freedom*, in which he claims that being free to do something warrants being held responsible for that act, Brown (2013) questions whether individuals should be held

morally responsible for their (un)healthy lifestyles. If this philosophy is considered valid, then engagement in unhealthy lifestyles could be considered immoral conduct toward other members of society.

As alluded above, physical well-being is intertwined with our mental state of mind in far more ways than eating disorders resulting from dissatisfaction with one's body structure. Physical pain or discomfort invariably gets signaled to the brain, thus escalating the physical context to a mental one. Since ethical decisions are also a mental endeavor, we may detect a mutually supportive correlation between a sense of well-being and ethical behavior. Corroborating the above, Mintz (2018) points out that there is a positive correlation between well-being, happiness, and ethical behavior. He affirms that our sense of well-being is largely influenced by our feelings of happiness and meaning: the more meaning we experience in our life, the happier we generally feel, and the greater our willingness to behave ethically. On the other hand, feelings of anxiety, a frequently occurring workplace phenomenon with numerous foundational causes, often result in notions of being threatened, possibly leading to self-interested unethical behavior (Kouchaki and Desai 2015).

## The Influence of Ethical Performance on Health

Doing the right thing, even if the outcomes are not always desirable, generally instills a sense of inner peace and calm, and reduces the chance of retrospective senses of guilt. Guilt has been known to have troublesome effects on individuals, varying from ongoing stress and paranoia, to more radical manifestations such as mental disturbance or even suicide. In personal as well as professional settings, it is therefore prudent to keep in mind that everyone is the leader of his or her actions, and that doing the right thing, albeit requiring courage sometimes, has the most positive effect on our long-term well-being.

Behaving ethically is an act that is oftentimes not considered as thoroughly as it should. Even in

the health profession we find that ethical performance is tainted by a number of factors, varying from personal perspectives (paternalism) to influences from income generating sources (such as the pharmaceutical industry). In a study among 425 health care professionals in Barcelona, Spain, it was found that the professionals demonstrated a high level of ethical performance when it came to listening, having compassion and protecting their patients. Yet, when it came to promoting patients' wishes and respecting patients' self-management, the study revealed that there is still quite some paternalism upheld in this critical industry.

### Internal Ethical Performance

Organizations that make it their business to embed ethics in their performance structures are usually also the ones that embrace a climate of diversity and inclusion, which positively impacts the health and well-being of individuals, business, and society (Sanyal et al. 2015). In recent decades, the term "Spirituality in the Workplace" has become essential in describing senses of interconnectedness, trust, a motivational organizational culture, reciprocity, and improved overall performance (Marques 2005). Spiritual performance, whether at work or elsewhere, starts at the personal level, either through internal or external influences, and can positively influence those around the individual, due to interactions, observations, motivation, and support, thus establishing a constructive "ripple effect" (Marques 2006).

When internal stakeholders engage in workplace spirituality, they obtain better awareness of each other's inner and outer life, increased sense of meaning and purpose in work, and a sense of community beyond economic self-interests (Ashmos and Duchon 2000). In verifying this narrative, Otaye-Ebede et al. (2019) collected data from 51 branches of a retail organization in the United Kingdom and discovered a number of interrelated facts, among which are a) a positive correlation between workplace spirituality and the organization's ethical climate, prosocial motivation, and moral judgment; b) an influence between the ethical climate on the relationship between workplace spirituality, prosocial motivation, and

moral judgment; and c) an influence between ethical climate, support, and service.

### Social Responsibility

Social Responsibility in light of organizational performance, is described in different ways by different people. Duarte et al. (2010) found that there are at least three ways to interpret corporate social responsibility: (1) performance of an organization that engages in efficient and ethical business performance; (2) when an organization actively contributes to the well-being of society, behaves in an ecologically friendly way, and acts in the field of social solidarity; and (3) when an organization implements human resources practices that demonstrate respect and concern for the well-being of employees and their families. The overarching theme among these three perspectives is an intersection between ethical performance and well-being or health.

Companies that engage in social responsibility practices, and communicate these properly to their employees, find that the overall perspective about the importance of ethics gets positively influenced among these employees. In turn, this perspective could result in increased ethical sensitivity in such work environments, thus influencing senses of equity, justice, and fairness, which positively affect employees' sense of job satisfaction and well-being (Valentine and Godkin 2009). When employees actively participate in Corporate Social Responsibility (CSR) practices, a greater collegial bond could be established, which may positively influence job performance – due to a heightened sense of ownership. It should also not be overlooked, that the overall perspective about the organization, by internal and external stakeholders, is positively influenced, which will have a constructive effect on both, the input and the output side of the business (Valentine and Godkin 2009).

Finally, a company engaging in social responsibility is making a conscious effort to improve societal health and well-being, and this interrelationship should not be overlooked either.

## Ethical Representation of Data

Charon A. Pierson  
Committee on Publication Ethics, Gilbert,  
AZ, USA

## Synonyms

Biased reporting; Clinical significance; Misrepresented data; Reporting guidelines; Statistical significance

## Definition

Data that are omitted, misreported to intentionally mislead, or misrepresented in any way to support an outcome or a theory are not ethically appropriate. The misrepresentation, either intentional or unintentional, can be achieved by manipulating numbers, figures, graphs, images, or selective

reporting of information crucial to a complete understanding of the project. According to the COPE taxonomy (2013), the definition of ethical representation also includes the availability of appropriate consents, approvals, and copyright forms.

## What Are the Issues?

Scientific advancement depends upon building evidence, often over multiple small experiments or theory developments. The results of this scholarship are presented in the peer-reviewed, scholarly literature. The report of a study requires several essential elements to qualify as a foundation for further developments. When authors misrepresent the steps in methodology and analysis, other researchers can be misled in their attempts to either replicate or advance an idea. Research done on human subjects must be done according to the principles developed by the World Medical Association (WAME 1964) at their 18th General Assembly in Helsinki, Finland. The Helsinki principles form the basis for institutional, regional, or national ethics approval boards for medical research involving human subjects or any of their identifiable human material (e.g., blood, tissue, genes) or any identifiable data contained in a repository (biobank). Assurances such as approvals or copyright release forms also demonstrate to the scientific community that the findings are ready to release to the community at large.

*Issues in conducting research.* Conceiving and conducting a research project can be a difficult task that requires enough financial support, intellectual preparation, time, and fortitude. Graduate education is considered the training ground for the future scientists of the world; thus, there is a vast enterprise within universities devoted to educating these scholars. The actual conduct of research within higher education is supervised by proven scholars in a discipline who have received grant funding or recognition as mentors. Universities also maintain human subjects review boards to

oversee the ethical conduct of student and faculty research. There are, however, perverse incentives that may have an adverse effect on research conduct, such as publishing requirements for promotion and tenure of faculty, time constraints for the educational progress of students, media and public relations for the institution, and funding requirements. Time pressures to complete a project may result in an inappropriate selection of human subjects or an underpowered study, rather than an unbiased selection of enough eligible subjects to make a meaningful analysis. In cases where publicity about an investigation raises expectations of novel or important results, negative findings might not be reported. Funders or sponsors of research should not be allowed to influence the reporting of results, such as encouraging suppression of unfavorable results. Some graduates from the academic research enterprise move on to apply their research skills to develop new products for large multinational corporations engaged in the pharmaceutical and device manufacturing industries, while others remain in the academic environment to continue research.

*Issues in publishing research.* Even when a research project has been conducted ethically and with due attention to avoiding the most common errors in methodology, the possibility of intentional or unintentional misrepresentation of data can occur in the written report. For most academic research, the written report is a manuscript submitted for publication to a peer-reviewed journal. Competition for acceptance of manuscripts is high for the most well-known journals in any given field. Therefore, the temptation to present all findings in the best possible way can reach the level of unethical misrepresentation of data. Some of the most common misrepresentations occur in describing subject recruitment, the plan of analysis, and the conclusions. When graphs, tables, images, or figures are included, there are several common flaws that intentionally or unintentionally misrepresent findings.

Recruiting human subjects for research is time consuming and often involves multiple people on the research team. Informed consent for

participation must be obtained without any coercion from researchers, including any payments or rewards given to subjects. The recruited subjects must be representative of the population of interest, and the researchers must report at least some details of those who refused (e.g., reason for refusal, number of refusals) to provide an unbiased picture of the participants. The plan for analysis of data must be decided a priori and followed to avoid substituting more favorable analyses or eliminating inexplicable findings. The data plan must also include information on missing data points and any methods used to impute missing data. All this information should be included in the manuscript, even if it is included in supplemental files. Researchers must avoid making conclusions beyond what the data support. Some common statements to avoid include trending toward significance, proves our theory, and settles the question.

The use of graphs, tables, images, or figures requires careful attention to avoid errors and misrepresentation. Misplacing numbers in a cell or mislabeling a row or a column is easy to do during the preparation of a manuscript. A careful proof-reading by more than one individual is useful at several stages of the process. As a visual representation of a finding, a graph can be deceiving if the scale is not appropriate to the data reported or the axes are mislabeled. Images and figures are a serious problem for some disciplines, and the use of image enhancing software can make an image appear significant when it is not. Reporting the results of statistical analyses must be done carefully to avoid misrepresenting findings. For example, in clinical research, statistical significance (i.e., a  $p$ -value of  $<0.05$ ) does not always equate to clinical significance. A recent warning about the misuse and misinterpretation of  $p$ -values from the American Statistical Society (2016, p. 132) advises, “Cherry-picking promising findings, also known by such terms as data dredging, significance chasing, significance questing, selective inference, and ‘ $p$ -hacking’ leads to a spurious excess of statistically significant results in the published literature and should be vigorously avoided.” Decisions about which analyses to perform should be declared a priori

and reported completely to provide context for the results. An example of the context needed for interpretation can be seen in reporting a statistically significant decrease in blood pressure from 148/92 to 142/90 among participants using drug A compared with drug B. While the calculation of the  $p$ -value could be significant, the clinical significance might not warrant any change in practice.

Several useful checklists and toolkits for reporting health research can be found on The EQUATOR Network (<https://www.equator-network.org/>) to guide researchers as they develop manuscripts for publication. The reporting guidelines strive to improve the quality and transparency of health research for publications. Authors can use the appropriate guideline when writing a manuscript, and reviewers can use the guideline to verify that all the essential elements of a study are reported. Many journals require the use of these guidelines and give specific instructions for authors and reviewers on their use.

## Ethical Responsibility of Orchestras in Contemporary (Multicultural) Societies

Parmela Attariwala

### Introduction

Symphony orchestras in liberal democratic, multicultural countries face a specific set of ethical challenges in the early part of the twenty-first century, due to domestic and international imperatives related to the importance of diversity and inclusion, and to the protecting of Indigenous cultures.

In order to contextualize these challenges, it is helpful to consider the origins and evolution of the symphony orchestra as a vessel of European aurality and aesthetics that can now be found in many parts of the world.

### History of the Symphony Orchestra

The Western symphony originated in Europe. The term “symphony,” when used alone, can refer either to the musical ensemble (characterized by a sizeable number of instrumentalists, of which those playing Western bowed string instruments — violins, violas, and cellos—form the core) or to a specific form of musical composition written for the symphony orchestra. Early symphonic music appeared in the sixteenth and seventeenth centuries as instrumental music that functioned as an accompaniment to other activities (liturgies, dances/ballets, dramas, operas, or background music for parties). During this time, music was commissioned and patronized by a combination of nobility, the church, or merchants who wanted to display their wealth through artistic productions. Though standardized now, the instrumental makeup of early symphonic compositions was limited by the musicians and

instruments to which composers—via their patrons—had access.

Through the eighteenth and nineteenth centuries, symphonic music evolved away from its accompanying function into what music historian Richard Taruskin describes as an “autonomous art” intended “primarily for contemplation, not for use” (Taruskin 2005, p. 65). This is the form by which the symphony, as ensemble, is currently understood and for which the symphony, as a type of composition, was developed. Since the eighteenth century, the minimum complement of instruments and number of players that constitute a symphony orchestra has been standardized. A degree of elasticity has allowed orchestras to incorporate technologically improved models of brass and wind instruments into its core, as well as a number of non-European percussion instruments.

In the latter part of the eighteenth century, musical patronage shifted from private entertainments for the aristocracy to public subscription concerts intended for a listening (and paying) audience. This shift allowed composers—of whom Ludwig van Beethoven (1770–1827) was one of the first—to self-produce performances of their own compositions, including symphonies. Arguably, this granted composers greater control over their compositional direction. Moreover, the ubiquity of printing allowed for the dissemination and performance of symphonic works across Europe and its colonies and, ultimately, anywhere that musicians versed in European-style symphonic performance practice lived. This, too, contributed to the standardization of the symphony orchestra: simultaneously creating a rigidity of orchestral practice while expanding the access of audiences (and potential composers) to the symphony.

For the past two centuries, the symphony orchestra has accrued a reputation of having significant cultural value, to the extent that the Romantic idea of “universal brotherhood” that Beethoven attempted to express through his Ninth Symphony has been transferred to the notion of the Western symphony orchestra as a pinnacle of human cultural achievement in a universal sense. The continued persistence of the

symphony's prestige and inherent universal cultural value may lie in a combination of its early association with the aristocracy; its historical coincidence with European colonialism and attendant presumptions of cultural superiority; and the European Romantic concept of the "artistic genius" whose masterworks were disconnected and uninfluenced by time and place. As a consequence, many symphony orchestras (particularly in Western capitalist countries) have come to be supported either wholly by the state (in some European countries) or by a combination of public, corporate, and private funding.

### Orchestras and Public Funding

In Western capitalist countries, state investment in the cultural sector is premised on the understanding that "the traditional market system of supply and demand—whereby consumers are willing to pay more than the mere production costs for a product (good) so that the producer might realize a profit—is not sustainable" (Attariwala 2013p. 72). This is particularly true for a professional symphony orchestra which may, for a given performance, require in excess of 100 players and for which there is a not insignificant public desire to experience acoustic music of this magnitude. Ticket sales alone, though, cannot compensate for the multiplicity of factors (beyond simply remunerating the musicians) required to produce a symphony concert. Thus, state and corporate funders subsidize symphony concerts with the understanding that artistic and cultural activities yield positive externalities, such that those who are not direct recipients of subsidy for the artistic endeavor still stand to benefit from access to the artistic work (Attariwala 2013, p. 73). As future generations might also be indirect beneficiaries of contemporary investment in arts and cultural activities, it follows that such activities should be adequately funded in order that the cultural "product" continues to yield meaningful sociocultural value.

Public funding models (such as arm's length arts councils) for the cultural sector developed

largely after the Second World War and in response to the fiscal impoverishment of European empires as a result of the war. At the same time, and for the same reason, empires withdrew from previously held colonies. The repercussions of these two actions—public funding intended for public (rather than exclusive) good and postcolonial cultural resurgences following decolonization—have contributed to the ethically problematic situation in which orchestras now find themselves.

### Cultural Expression, Value, and Decolonization

As newly independent countries underwent decolonizing shifts in the latter half of the twentieth century, manifestations of the decolonization—particularly in Africa and Asia—included reclaiming pride in local forms of cultural expression. In the larger (albeit predominantly white, Europeanized) territories—such as the United States, Canada, Australia, and New Zealand—as well as in the former European empire nations themselves, waves of immigration (and slavery) resulted in increasingly multicultural societies. Significantly, the decline in empire was accompanied by a revaluing of non-European selves and culture, resulting in demands for liberal-democratic rights and respect to be extended to members of Indigenous, non-European, and/or ethnocultural minority groups. These groups also demanded equal access to cultural funding, including funding that supported artistic expressions of their cultural differences. In many cases, multiculturalism and tolerance have been signaled through modes of expressive culture such as music, dance, art, food, and costume, precisely because they are the least socially problematic modes of signifying difference.

Thus, the current predicament confronting symphony orchestras in multicultural countries (and the various public and corporate structures that fund them) stems from political and social pressure to show that institutions benefitting from substantial amounts of public funding should be

both accessible to, and demonstrably reflective of, the greater society in which they operate. Yet, many symphony orchestras do not attract members of postcolonial heritage into any level of their infrastructure, including the preprofessional educational level. Additionally, and problematically, attempts to actively recruit members of postcolonial ethnocultural groups into the orchestra's educational infrastructure by drawing upon tropes of the music's universality and "greatness" only perpetuate colonial paradigms of cultural superiority. Such initiatives, moreover, disrupt both international directives (United Nations' Declaration on the Rights of Indigenous Peoples, 2008) and nation-specific decolonizing agendas. Thus, the philosophical concerns about culture and cultural value raised by decolonization have contributed to a twenty-first-century dilemma regarding the continued sustainability of symphony orchestras as an "international" form, begging answers as to whether, and how, they can be ethically responsible in the wake of the decolonizing dynamics of contemporary liberal-democratic, multicultural nations.

## Ethics and Artificial Intelligence

Artificial intelligence – AI

## Introduction

We have been encapsulated by images of humanoid robots, often portrayed in science fiction movies and TV series, that look, speak, and act, like us. This human mimicry is what is often what is understood as "artificial intelligence" (AI) in popular culture. It is typically the most inviting, interesting, and visual picture of AI that allows us to understand the potential of this technology. These types of AI robots often take on the role as our assistants, colleagues, friends, and even lovers. Conversely, media has also portrayed AI through dystopian images, such as Skynet in the Terminator franchise, whereby, these machines turn against us and try to either enslave or eradicate us altogether. AI is conveyed as either leading us to utopia or being our downfall.

While these depictions are still in the world of science fiction, AI has started to receive increased attention over the past decade as something that will propel the economy and humanity like no technology before it. There is certainly a lot of hype around how AI is the future for business, and can solve many challenges we face today, throughout a wide array of domains (health care, transportation, insurance, agriculture, and administration, to name a few). However, what is meant by "AI" is sometimes vague, which makes it difficult to identify the ethical issues that we need to consider.

## What Is AI?

AI is typically understood as the performance of intelligence by digital technology, to a degree independent from human control. Of course, what classifies as acts of intelligence and to what degree they must be independent from human control is open for debate. How to distinguish between advanced (non-AI) technological solutions and AI solutions is often challenging, and many people group a wide array of digital applications under the “AI” banner. For example, recently, it was reported that 40% of “AI startups” do not even use any form of AI (Vincent 2019). There is such a huge buzz around AI that everyone wants to be seen using it.

AI is intelligence that is different from natural intelligence, as it is constructed and created through digital technologies. These advanced intelligent systems have the capability to perform complex tasks normally associated with humans, “such as image recognition (vision), speech recognition (hearing), and natural language generation (speaking). AI is artificial mimicry of tasks and functions that would otherwise require human intelligence” (Ryan 2020).

AI takes the form of computer programs and software to process, predict, and prescribe actions. This type of AI is being used to determine whether one should be granted bank loans or insurance payouts, identifying areas that police should patrol, criminals’ likelihood to reoffend, provide prognosis for cancer patients, detect fraud, and provide tailored recommendations for end users.

AI can also be embodied within robotic machinery, taking a humanoid form, or in the form of cars, drones, farming machinery, medical devices, and so forth. However, not all robots have AI, there are also “dumb robots” that are completely under the control of a human agent or do extremely restrictive tasks (e.g., bomb disposal units, robots in manufacturing plants, etc.). Robots that have AI often create their own unique challenges, which will be shown throughout this chapter.

## What Is AI Ethics?

A subdiscipline has emerged around AI ethics, which is comprised of a wide array of individuals: computer scientists, ethicists, cognitive scientists, roboticists, legal professionals, economists, sociologists, gender, and race theorists. This has led to a very interesting branch of research, addressing issues surrounding the development and use of AI. This chapter will give a very brief snapshot of some of the most pertinent ethical concerns. Many of the issues in the Big Data Ethics chapter in this collection are often applicable to AI ethics, because of the data that these technologies retrieve, store, and use, so will not be duplicated here.<sup>1</sup>

While data-related issues are not new or unique to AI, AI does hold the potential to dramatically retrieve and analyze data that would not be possible otherwise. Data is being used in unique and transformative ways, such as the use of facial recognition to identify individuals from photos or CCTV; AI robots to retrieve live video feed about the patient(s) that it is monitoring; or in new ways, such as self-driving cars collecting an abundance of data about our surroundings, how we drive, and passengers in the car. There is the potential to infringe on individuals’ privacy, restriction of resources, or at worst, the creation of a surveillance society.

## AI and Discrimination

AI is being used to make predictions about future events, but also, in many contexts, it provides prescriptions of actions that should be taken. With the inclusion of AI in the decision-making process, it has raised several problematic concerns related to unfair bias, discrimination, and justice. There is the possibility that unfair biases arise

<sup>1</sup>Many of the challenges faced in the ethics of Big Data correlate with AI ethics. This is because vast streams of data are being retrieved, stored, cleaned, processed, and used, by AI applications. Many of the issues discussed in the Big Data Ethics chapter are equally applicable here, therefore.

from the *data that is inputted* into the AI model, the *types and ranges of data used*, the code within the *algorithm* itself, or biases in how the recommendations (*output data*) from AI are interpreted.

For example, self-driving vehicles' computer vision has recently been shown to have a much lower accuracy to detect people of color, putting them at a much higher risk (Cuthbertson 2019). Banks, insurance companies, and HR are using AI to identify risk individuals who will not pay back loans, are committing insurance fraud, or suitable candidate based on their personal data. Much of these recommendations are based on data, such as the individual's postcode, names, gender, and the university they attended. In other words, AI has been making assumptions based on data that is closely linked to one's ethnicity, gender, class, and background.

Even scarier is the idea that AI can be used to "predict" our behavior, personality, moods, and even likelihood to commit (or re-commit, for reference see COMPAS in the USA (e.g., see Rahman 2020)) crimes (spoiler: it cannot). In the latter example, AI is making these predictions based on racially biased datasets and on racial feature similarities. This modern form of phrenology is hugely problematic and is a form of pseudoscience that keeps being used, despite being discredited time and time again.

AI is also being used by police to predict potential crime hotspots, based on historical data, using predictive algorithms. However, there is the threat that AI will identify impoverished areas, leading to overpolicing and feelings within the community of constantly feeling monitored, and/or it will cause other areas to be neglected and underpoliced. This would have a self-perpetuating and reinforcing effect on crime, as the data confirms that these were indeed crime hotspots, thus advocating for their increased patrolling.

## AI and Manipulation

There is also the potential that different forms of AI will manipulate our behavior. For example, the use of targeted advertising, using advanced AI

methods, to identify and customize ads and lure us into buy their products. There is a much stronger capacity for companies to specifically target individuals with the use of AI. AI has also recently been used to manipulate individuals in voting, by creating, circulating, or reinforcing misleading content, targeting those who may be swayed one way (see the 2016 US Presidential Elections and the United Kingdom's Leave Brexit Poll).

There are also many forms of AI that are specifically built to deceive and manipulate, such as "deep fakes," which create fake video, audio, or image content that looks or sounds exactly as though it were real. Deep fakes manipulate individuals into believing that certain actions occurred, individuals behaved in a certain way, and altogether, manipulating our perceptions of reality. There have already been problems with deep fake "revenge porn" and there is also a concern about their potential to incite social unrest, violence, and war. This use of AI poses grave threats of disinformation, which thus impacts our informed decision-making and actions.

## AI and Responsibility

It is unclear who is responsible for the actions of AI. As this technology will be learning, behaving, and interacting with humans, relatively independently, there is concern about responsibility allocation when things go wrong. Who should be held responsible when self-driving vehicles' malfunction causes a crash (see the 2016 Uber death in Arizona); AI programs that say racist or harmful things (see Microsoft's Tay); or it underscores school grades, stopping people from getting into the university they were hoping for (see the UK's 2020 algorithmic grading debacle)?

As AI acts autonomously from human action, it is difficult to classify it as simply an instrument for human action. AI can independently make important decisions about our lives. Traditional instruments can be misused by the user, or they can malfunction because of a manufacturing fault; however, the autonomous actions caused by AI may materialize outside of these traditional

parameters. Furthermore, the design and use of AI often brings a very large range of stakeholders together, making it quite difficult to pinpoint the stage of development that led to the harmful event.

The type of tasks that AI should be given is also quite controversial. The level of responsibility of AI, its potential risk, and its capacity to fulfill these activities can be difficult to identify. Some have proposed that greater understandability, transparency, and “explainable AI” will allow us to trace the causes behind an AI’s action, thus making it easier to allocate responsibility. However, there is often a trade-off between developing AI that is more effective, but may have less understandability about how it arrived at those decisions (some may be completely unknown, otherwise known as “black box actions”), and a form of AI that is more understandable, but perhaps less effective.

## AI and Autonomy

There is much debate about what level of autonomy AI should possess, with one of the main concerns surrounding a future where there is difficulty to differentiate AI agency from human agency (Allen et al. 2006; Crnkovic and Çürüklü 2012). AI will have an increased level of independence from human agency, so some claim that they need to have a built-in ethical response to real-world situations, becoming “artificial moral agents” themselves (Crnkovic and Çürüklü 2012). Utilitarianism, deontology, and virtue ethics have been proposed as ethical frameworks that could be programmed into AI to guide their behavior (Wallach and Allen 2008). Others propose implementing AI with bottom-up approaches to ethics or building-up moral competencies through learning itself (Anderson and Anderson 2015). Crnkovic and Çürüklü (2012) add that the use of AI will vary, and so too will the level of autonomy in specific contexts and applications. Many of the same issues that arise with all these ethical frameworks will emerge when implemented within AI,

but creating many new, challenging issues, with one of the most challenging: should they even have this kind of capacity or agency in the first place?

## AI and Moral Agency

One of the concerns around AI is whether it should be given the capacity to become a moral agent. However, another one is how do we know that AI is acting as a moral agent and not simply emulating how a moral agent should act. Some have suggested developing a “moral Turing test,” whereby an interviewer asks AI a series of questions, to see if they can distinguish the machine from a human’s moral reasoning. There is also the “comparative moral Turing test,” where the interviewer is asked to compare the answers of a human and AI to see if they can identify if the robot is giving a less moral answer of the two (Allen et al. 2000). However, both tests are flawed as they still do not answer whether the AI understands what they are saying or if it is just a carefully, and intelligently, reiterated phrase that materializes from their programming. Establishing a method that can determine the moral agency of an AI is challenging and is an ongoing area of research within the field.

## AI and Robot Rights

Closely aligned to analyzing the moral agency of AI is how we behave and interact with AI, and what type of moral considerability should it receive. At what level should we begin granting AI with specific rights and acknowledging its moral considerability? Typically, this question gets asked in the context of AI robots, but some still speculate about our behavior towards non-embodied AI (take, for instance, the fictional HAL 9000 from 2001: A Space Odyssey). The field is divided between those who believe we can and/or should, while others state that we cannot and/or should not, attach rights to AI robots.

Kate Darling (2016) claims that we should grant AI robots with rights because it feels wrong to harm them, regardless of their capacities. Some propose that AI will have a higher form of intelligence in the future that will require us to grant them rights, so we should preemptively do this before they demand them (Asaro 2006). In contrast, Joanna Bryson (2010) proposes that we *could* design machines with this level of intelligence, but that we *should not*, as it is morally undesirable. We should not create AI that necessitates the granting of human-like rights to these machines. Whereas others propose that we will never be able to design a machine, nor should we, that would necessitate the granting of rights, because they are still simply artifacts of human creation (Johnson 2006). While Gunkel (2018) believes that we should grant AI robots moral consideration regardless of their ontology, because this is how we act in the real world; namely, we behave ethically towards others without knowing their inner capacity or ontological development.

### AI's Effects on Human Relationships

The widespread use of AI may have a dramatic effect on human-human interactions. If AI becomes advanced enough that people are unsure if they are interacting with a human or AI, it may cause us to be very apprehensive when interacting with others, for the fear that we are interacting with a robot. This is an issue that is commonly referred to the “uncanny valley,” where people report being comfortable interacting with a human-like AI robots up to a certain point. When that likeness is indistinguishable, it becomes undesirable and unnerving. Lifelike AI may also impact the way that we behave towards other human beings. The objectification and instrumentalization of robots may cause us to behave in a similar way towards other human beings.

Using AI in certain contexts may also replace many valuable human interactions. Replacing humans with AI in health and care settings

holds the potential to dehumanize, objectify, and instrumentalize those patients. Respect of the individual patient and their sense of dignity would be harmed if there is a sense that these “burdens” should be taken care of by AI robots, instead. Our interactions with the elderly, vulnerable, and persons with disabilities may be directed towards AI, creating, or exacerbating, feelings of isolation, loneliness, and debasing their humanity.

### AI and Unemployment

There is also a huge concern around employment when AI is set to replace many human jobs, as they will be able to do them more efficiently, for less money, and without much of the “hassle” of employing humans (insurance, health care, trade unions, etc.). However, what will become of the individuals who used to work in these jobs, and will it negatively transform some sectors entirely, as a result? There is a tension in the field, with some proposing that AI will allow us to have more free time, reducing the length of workweeks, and will replace many of the “dirty, dull, and dangerous” jobs within society. Individuals can retrain, upskill, and altogether, do safer, cleaner, and more interesting work.

However, there is also skepticism, with fears that the capitalistic society in which we live will simply force individuals in (often) low-paid and low-skilled jobs out of jobs, with no opportunities for future employment. While technologization and its effect on employment is nothing new, the sheer range and abundance of jobs that will be under threat by AI replacements is unparalleled, so requires careful attention to ensure that this transition is desirable, ethical, and balanced for society.

## Introduction

There is no unanimously accepted definition of corporate social responsibility (CSR) but it is generally taken that this notion involves the idea that business has responsibilities towards society, which go beyond those of making economic profits.

Discussion on CSR emerged in academic literature in the 1950s, and some time before in business practice. In the 1970s, CSR became mainstream in terms of academic analysis of the pros and cons of the concept. The debate was stoked by Milton Friedman, who denied that such a thing as social responsibility could be applied to business beyond making profits. At the turn of this century, the relevance of CSR emerged again, along with other related concepts such as corporate citizenship and sustainability.

Business ethics (BE) gained impetus in the early 1980s and, in the following years, became an accepted academic discipline and entered into business practice. Business ethics, in broad terms, deals with the ethical dimension of business. Inasmuch as BE and CSR are related concepts, a conversation on the connection between them soon started. Two opposite positions were presented. The first was mainly defended by Archie Carroll (1991), who argued that the ethical responsibility of business is only one aspect of corporate social responsibility (others are economic, legal,

and philanthropic). The second, supported by most business ethicists, is that business ethics covers all aspects of business, including business in society. Corporate social responsibility, therefore, is no more than one aspect of the broader field of business ethics. This entry takes the latter position, which entails a philosophical foundation of ethics.

## Ethics

According to Aristotle and the other ancient Greek philosophers who started the reflection on the human experience of morality, ethics refers to good and bad. Not in any partial sense (good business, good car, good health, etc.) but good for the human; that is, what contributes to human flourishing. In this understanding, human virtues are central, as are the corresponding objective ethical values. However, from the eighteenth century, ethics was largely focused on determining right and wrong actions. In this perspective, ethical theories should propose rationalist principles in order to provide tools for evaluating ethical issues and for solving dilemmas. Emotivism, which bases moral judgments on subjective feelings, also had relevance. Nowadays, however, there is a renewed interest in the classic vision of ethics as a guide for human flourishing, although without rejecting its usefulness in evaluating specific human acts. This followed severe criticism of the modern conception of ethics as rationalistic-based principles and emotivism (Anscombe 1958; MacIntyre 2007)

At the beginning of the business ethics movement, a principled-based ethics (deontology, utilitarianism, social contract theories, and others) was dominant. At that time, much attention was paid to misbehaviors of employees and managers, including bribes, frauds, misleading consumer information, abuses in labor, among others. Subsequently, companies have implemented initiatives to detect, to stop, and to prevent bad practices. Thus, business ethics was related with specific issues rather than with promoting good. In the following decades controversial issues such as pollution, insider trading, financial scandals –

like Enron and Madoff, and the subprime mortgage crisis – nourished the custom of focusing business ethics on misbehaviors.

In 1990s, the situation changed with the growth of virtue ethics and its application to business. This line of thought emphasized the idea that ethics is mainly about doing good, which includes – but it is not reduced to – avoiding bad. In this Neo-Aristotelian view, ethics is a guide for human excellence for every human action and not reduced to evaluating whether an action is right or wrong or as a means for solving ethical dilemmas (Melé 2019: 9–10; 17–18).

From a societal perspective, the latter focuses on acting in accordance with whatever might be reasonably discovered as good for all (common good). A good society includes, for instance, respect for human dignity and rights, a clean environment, means for a decent life and for personal growth, a fair legal system, social cohesion, peace, and so on. Virtue ethics, as noted, also pays attention to determining what a right action is. The evaluation is made by taking the conformity or otherwise of the action with virtues (justice, truthfulness, etc.) as its reference, or by relating virtues with principles that denote respect for human dignity and human fulfillment.

Taking ethics as the guide for human excellence, it can be related with CSR in three ways. First, as a lens through which one can look at and evaluate CSR theories and practices, second, as a motivator for assuming CSR in corporate activity, and third, as a source for determining specific contents of CSR.

## Ethics as Evaluator of CSR

Looking at different CSR proposals through an ethical lens allows us to evaluate them and to consider whether a theory of CSR entails a sound ethical foundation.

Several theories of CSR and subsequent developments have been presented (Crane et al. 2008). Some approaches take social expectations or social values as the normative core for the responsible behavior of business. Exploring social values and expectations and local ethical

costumes makes sense in business but it is not a guarantee of good ethics. To accept that social moral values and customs are what determines morality leads to cultural relativism, which is quite problematic. For example, some societies are quite permissive with corruption, or do not respect certain human rights, or pay scant attention to safeguarding the environment. Similarly, to consider the satisfaction of the stakeholders and promote their engagement is important, but these are not sufficient for a sound ethical approach.

A number of CSR proposals take political theories as the normative core, including the liberal citizenship perspective (Crane and Matten 2008) or Habermas' deliberative democracy (Scherer and Palazzo 2011). The business firm is a part of the society and, in a certain sense, can be considered as a sort of citizen or perhaps as a political actor. These approaches are not based on ethics, however, unless one derives ethics from political theory, which is beyond the understanding of ethics as a guide for human flourishing.

Some CSR approaches are based on a philosophical pragmatism in which any ethical theory is welcome if it makes the model work. This is, for instance, the case of Freeman's stakeholder theory (Freeman 1994), and the subsequent "Corporate Stakeholder Responsibility". Nevertheless, the stakeholder approach could be acceptable if a sound ethical theory is applied.

Finally, a CSR theory can be aligned with the Aristotelian approach to business, which "is ultimately nothing other than the recognition of business as an integral part of the larger society." (Solomon 1992: 185). From this perspective, business should contribute to the common good of the society. This is the main social responsibility of business. Virtues foster CSR oriented to the common good (Arjoon 2000).

## Ethics as a Motivator for CSR

The reasons for companies taking an interest in CSR and undertaking consistent actions can vary widely. A first motive might be to protect

themselves against risky situations, or to counteract a reputational crisis they have suffered. Sometimes, it can be a way of seeking reputation proactively. Positioning the company in the market and distinguishing it from competitors can be another reason to assume CSR. On other occasions, it will be for a reason of political opportunity, to facilitate the relationship with other social agents. CSR can be for organizational motives, such as attracting responsible employees or to retain talent. Finally, some companies will be interested in CSR due to the conviction that is the right thing to do and there is intrinsic value in assuming social responsibilities. In this latter position, ethics works as a motivator for CSR.

There are companies that act for the sake of an immediate economic impact and with a low commitment, while others do so from conviction, which requires greater commitment, although the economic impact may be perceived as low. Ethics as a motivator of CSR is in this latter group

Companies may move not for a single reason, but for a mix of reasons. If these motives support each other, they will create positive synergies that will make it easier for the company to advance in its socially responsible actions.

In some, initial motivation to assume CSR is an immediate economic impact, although over time they might move to mid-term results. However, many others seek the return on investments in social responsibility in a long-term. This is favored when managers are convinced that there are deeper reasons to persevere in their interest in social responsibility.

Companies may be motivated to work on CSR for the so-called "business case," meaning that CSR brings about benefits for the company as well as for the community. Experience shows companies are interested in CSR only to the extent that it is useful – that is, as an instrument for profits – they end up disappointed with their achievements.

Ethics inspires the so-called "moral case," which denotes that CSR is assumed because acting responsibly is good in itself. Only those companies that get to this deepest reason will keep

their commitment alive, although economic results may not come in the short run. Managers of these companies will consider CSR as an ethical requirement, not just a fad.

### Ethics as a Source of Contents of CSR

CSR is quite often reduced to certain corporate actions with social content, such as philanthropic donations, promotion of volunteering among employees, sponsorship, corporate community involvement, and others. However, a wider view of CSR entails responsibilities associated with the interactions between business and society. In this latter perspective, three types of responsibilities can be distinguished (Melé 2019: 298–301): (a) social responsibilities for the operations of the company, (b) social responsibilities associated with stakeholder relationships (these may be termed “integrative responsibilities” as they favor the integration between the firm and its stakeholders), and (c) socio-political responsibilities, derived from considering the corporation as a social actor within the society. Some of these responsibilities are legal obligations while others derive from ethics (some authors will consider the latter as “voluntary” to emphasize that they are not legally compulsory).

Ethics – and more specifically business ethics – can shed light for a correct understanding of the content of these responsibilities:

- (a) *Operational responsibilities*. These refer to the ethical and social aspects of specific business activities, such as products, work organization, wealth creation and distribution, impact on the environment and the continuity of the firm. Business ethics has studied the products offered and sold by companies widely, including discussions on topics such as the type of product and its development, truthfulness, and transparency on significant features of the product, safety, fair prices, honesty in advertising and promotions, and good service. With work organization, ethics
- requires the promoting of decent work by respecting labor rights and by fostering meaningful work and personal growth through work. Generating wealth fairly refers to avoiding fraud, monopolistic abuses, and any other abuse of power. Since business operations involve certain impact on environment, these should show all aspects of ecological responsibility (responsible use of raw material, energy, and waste, avoiding pollution, recycling and stewardship of the product, including fostering recycling). Ethics also requires a prudent and just wealth distribution, considering the legitimate rights of stakeholders and the stability of the company. Finally, striving for continuity of the firm by good management and governance allows the firm to serve the common good through the fore mentioned operational responsibilities.
- (b) *Integrative responsibilities*. This second type of responsibilities refers to how the company deals with its stakeholders ethically. Firstly, it requires respect for the stakeholders’ legitimate rights – generally included in the law – such as honoring contracts and promises, giving these respectful treatment. A deeper ethical consideration of stakeholders includes a sincere dialogue with them, paying attention to their legitimate interests, trying to prioritize their demands, and solving possible conflicts, as well as promoting reciprocity and mutual collaboration. These responsibilities are aligned with human flourishing and the promotion of the common good.
- (c) *Socio-political responsibilities*. Considering the company as a social actor entails responsibilities beyond its ordinary activities, contributing to the well-being of the societies where it operates in accordance with the capabilities and the mission of the company. Beyond paying taxes – obviously compulsory by law – socio-political responsibilities include contributing to social activities such as actions of philanthropy, social investments,

or sponsorship, and to any other action appropriate for improving the society where the company operates. Particular importance is given to how the firm contributes to sustainability, which includes the well-being of future generations.

Good corporate governance establishes guidelines and supervises management in operative and integrative responsibilities to maintain the company as a good social actor.

### **Ethics and International Standards for CSR**

In recent times, the United Nations has promoted valuable initiatives related to CSR, in which, without mentioning ethics, there is, effectively, orientation towards the common good, and in this sense ethics, as the common good of the society – actually of society worldwide – is integrated into CSR.

One of these is the Global Compact, an initiative launched by the United Nations Secretary General Kofi Annan. In 1999, he proposed nine principles for companies to work on for human rights, labor, and the environment. Subsequently, a tenth principle was added in 2003 to fight against corruption. A more recent proposal of the UN is the Sustainable Development Goals (SDGs) launched in 2015. The SDGs contain 17 objectives that cover the most relevant topics for the future of the planet that will hopefully be resolved by 2030.

In recent years, sustainability has tended to replace the concept of CSR, both in the academic field and in the activity of companies. However, the notion of CSR is still alive and expresses how companies integrate their social and environmental concerns in their operations and in their relationships with their stakeholders. A more explicit reference to ethics is sometimes lacking in CSR texts. Some authors speak of the “triple-bottom line approach” to express how companies try to achieve a balance

between economic, environmental and social imperatives. Others have coined the acronym ESG to refer to the environmental, social, and (good) governance criteria that should guide the activity of companies. Regardless of the term that is used, a more explicit reference to ethics – which would enrich understanding of CSR – is often lacking.

### Introduction

The problem of ethical leadership in turbulent and unfriendly business environments is legion. It might even be said that never before in the history of business has the effects of organizational crises mismanagement been endured by so many through the unethical behaviors of so few.

While the problem of unethical leadership is undoubtedly a global one, the urgency of generating ethical leadership to advance the development of Africa has never been more evident than it is today. According to Transparency International (2016), African countries occupy half the ten lowest ranked countries on their “perceptions of corruption index” ([https://www.transparency.org/news/feature/corruption\\_perceptions\\_index\\_2016](https://www.transparency.org/news/feature/corruption_perceptions_index_2016)).

However, more than two-thirds of the 176 countries and territories covered in the 2016 survey fall below the mid-point of the “perceptions of corruption index” where 0 equals “highly corrupt” and 100 “very clean.” The global average score is 43 indicating perceptions of substantial levels of corruption in a country’s public sector. Although the survey is focused purely on public sector institutions such as the

police and judiciary, grand corruption thrives in such contexts where politicians and private businesses collude in illicit practices for mutual enrichment (Transparency International 2016). The unethical/corrupt behavior of management is also evident in their reaction to crises, so there is a correlation between unethical management and unethical management reactions to company crises. Thus, crisis management, which can be defined as a: “Set of procedures applied in handling, containment, and resolution of an emergency in planned and coordinated steps” ([www.businessdictionary.com/definition/crisis-management.html](http://www.businessdictionary.com/definition/crisis-management.html)), can be handled ethically or unethically with concomitant profound knock-on effects to its reputation.

Recent crises at Volkswagen over exhaust emissions, Ford over the Kuga “flammable car” which found senior management in denial despite clear evidence, and tax evasion at Deutsche Bank who were forced to pay \$95 million to resolve a US government lawsuit that accused it of tax fraud for using “insolvent” shell companies to hide significant tax liabilities from the Internal Revenue Service in 2000. These are all examples of recent crises generated, wholly or partly, by unethical management practices.

However, the way management reacts to such crises is critical in its ability to maintain its existing ethical reputation and to even to accumulate additional reputation capital (defined as the accumulation of positive consumer perceptions from past and current ethical management behavior and actions attached to a particular company) if it is its responses to such crises are handled particularly well.

### The Tylenol Example: An “Ideal Type” Case Study of Ethical Management Crisis Intervention

An “ideal type” strictly refers to “a common mental construct in the social sciences derived from observable reality although not conforming to it in detail because of deliberate simplification and exaggeration. It is not ideal in the sense that it is excellent, nor is it an average; it is, rather, a

constructed ideal used to approximate reality by selecting and accentuating certain elements” (<https://www.britannica.com/topic/ideal-type>).

However, the term is used in the Tylenol example to be described below, as a foundation example for the development of a mental construct (i.e., one which conforms to the definition given above). The foundation example offered by Johnson & Johnson of how to respond ethically to an organizational crisis offers a platform to build a model derived from it, which also is embellished with additional aspects gained from the extant literature, into an ideal typical model of ethical management crisis intervention that selects and accentuates certain elements taken from the foundation example or case study taken from reality. Possibly the most celebrated ethical management crisis intervention is that of Johnson & Johnson’s subsidiary, McNeilab. Inc’s reaction to what became known as the “Tylenol crisis.” Tylenol is an aspirin-based drug that was introduced into the market in 1961 and swiftly became popular and profitable. In 1982 seven people in Chicago died after taking Tylenol medication and, after a thorough investigation, it was found that the tablets responsible for these deaths had been impregnated with cyanide. The company then conducted a further investigation which took several weeks to complete, to ascertain whether the capsules had been contaminated during the production process, or the bottles in which they were sold had been tampered with when being marketed (Kaplan 1998). Having established that it was tampering of the bottles in which the capsules were sold that was the problem, the company responded ethically by swiftly recalling 31 million bottles of the drug worth 100 million US dollars. Five hundred thousand letters explaining the situation were sent to doctors, hospitals, and Tylenol distributors which also gave instructions on what to do with existing supplies of the drug. Company management set up toll-free hot-lines that consumers could use to ask questions relating to the drug and resolve specific problems.

After the crisis, Johnson & Johnson had to find a way to deal with the tampering of the Tylenol bottles without losing their reputation for producing a quality product and packaging it

appropriately. They also had to allay consumer fears that the bottles could not be tampered with in the future if they were to maintain the sales of and profit from their most popular product. As a direct result of the poison incident, the US government instructed manufacturers of over-the-counter medicines to design tamper resistant packages. Johnson & Johnson responded by including all three precautionary measures of glued end flaps, a plastic neck seal an inner foil seal, and a label with the instruction not to use the product if the seals were broken, despite being required by the US government to use only *one* of these precautionary measures. This openly showed the company’s sincerity in correcting the situation by demonstrating to consumers its genuine concern and willingness to go the extra mile and sustain the extra cost to protect consumer health and welfare. The company also embarked on a manufacturing and distribution drive to make the new packaged product available in the shortest possible time. The trifold barrier tampering proof package was new in design and is today generally adopted by food and pharmaceutical manufacturers worldwide. The multistep process implemented by Johnson & Johnson in response to the crisis was widely acknowledged and lauded by the media. As a result of the ethical response by management, Tylenol rapidly regained its status in the marketplace a product of consumer choice. Johnson & Johnson by their timely ethical management response to the crisis and by following a step-wise systematic approach that used open communication and clear demonstrations that it put its consumers health and welfare before profits was able to recapture the market for its product without much difficulty.

## Ethical Leadership in Crisis Management

Coldwell et al. (2012) in a recent study of crisis management in the South African industrial context use Weber’s “ideal type” methodology (Morrison 2006) by adopting The Johnston & Johnston’s widely recognized example of international best practice in crisis management. Coldwell et al. (2012) use a combination of a

qualitative approach using case studies and a quantitative time series analysis to investigate South African firms which had recently suffered crises which had a strong propensity to undermine their corporate reputations. Findings from the study (Coldwell et al. 2012) suggest that both the number and content of remedial steps taken by companies and the speed in which they are implemented in conformance with a seven step model (illustrated and described below) reduce the size of the share price falls immediately after crises occurrences. The findings also suggest that larger share price appreciations over 6-month postcrises are associated with greater perceived corporate reputations and brand strengths (reputation capital). Coldwell et al.'s (2012) stepwise model of ethical management crisis intervention is illustrated in Fig. 1.

Figure 1 shows the basic schema of the step-by-step ethical management intervention crisis model. The model suggests that company crises

should be dealt with by the implementation of seven prescriptive remedial steps derived from the best practice (ideal type) example of Johnston & Johnston described earlier in the paper. The first step must be a rapid recognition of the crisis by management and an unequivocal acceptance by management of its ethical responsibility to resolve it. This must be backed up with open and transparent communication with the media and management's action being taken to first control and later resolve it. The media and public interaction needs to be carried out by ethical leaders who are trusted and known to the public for being such through their past reputations and through their current openness, honesty, and reliability in all their public interfaces concerning the crisis. Once the responsibility for the crisis is admitted and a genuine unequivocal apology made for this, the process of rebuilding consumer and public confidence in the company and its products can proceed from a firm base of consumer trust.

**Ethics and Crisis Management, Fig. 1** The ethical management stepwise crisis intervention model (Adapted from Coldwell et al. 2012)

Next remedial step management takes to solve the crisis through restructuring, redesigning, and modifying the company and/or product needs to be widely communicated to consumers and the public at large to rebuild its credibility. This should be linked with a clear statement of the company's ethical societal (economic, social, and environmental) responsibility. Whether or not already made, a final open apology to its consumers, the community, and the public as a whole should be made by the CEO. The tendency in many cases is for a company's senior management to absolve itself from direct blame or responsibility for the crisis and to try to deflect this on others. There is a tendency also for management when faced with a crisis with specific ethical ramifications, to batten down the hatches by stopping completely, or severely restricting media communication and to give a parsimonious and qualified "others are blameworthy too" apology. Actions by senior management in reaction to a crisis with ethical ramifications of this ilk nearly always heighten public anger and add fuel to the growing suspicion that important information is being deliberately hidden. Senior management's actions of this kind undermine consumer and public confidence in the product and company brand and in the ethicality of its management. This can seriously reduce or even, in some cases, completely destroy any social and reputation capital the company may have enjoyed.

Figure 1 indicates postulated associations between the variables. A corporate crisis with specific ethical ramifications sets in motion a reaction by management that involves remedial steps to limit and potential damage and, ultimately, resolve it (indicated in Fig. 1 by the arrow interlinking a specific crisis situation with the 7 remedial steps that ought to be taken by ethical management). Reputation capital is built up through effective and ethical management reactions and management that implements the seven major steps of the stepwise model can be expected to be companies that have already generated such capital (thus the two-way arrow interlinking these variables). Also, Coldwell et al.'s (2012) study, briefly described earlier, shows clearly that both pre- and postcrisis

built up reputation capital and the full, or nearly full, endorsement of the seven-step ideal type crisis management model has a positive impact on post-crisis share price values (indicated in Fig. 1 by the two-way arrow interlinking these variables).

## Conclusion

Ethical management in response to a crisis with specific ethical ramifications requires timely and responsible actions to control the damage wrought by the crisis on its effective functioning and, ultimately, to find a durable solution to it. Prescriptive remedial steps for achieving this have been indicated in a model that can be regarded as "ideal typical" in that management may not be in a position to fully follow the seven indicated steps. However, recent empirical evidence and the experience of successful company behavior in the past as documented in the extant literature suggests that near or complete conformance to the model described in the paper will result in the development of reputation capital while reducing the propensity for negative reactions in financial markets.

## Ethics and Economics in Healthcare Decision-Making

### Definition of the Topic

The action or process of making important decisions regarding organized provision of healthcare to individuals or to community, which must include ethical and moral principles and be at the same time economically justified in terms of sustainability of the healthcare system.

### Introduction

During the course of their work, healthcare professionals encounter various ethical decision-making dilemmas which may concern three primary relationships: patient and provider, patient and payer, and provider and payer. High ethical standards need to be implemented into the decision-making process, and the necessary systematic changes must be made for the sustainability of the healthcare system in order to decrease healthcare costs and consequently improve the trust in change processes. Organizational

leaderships are in the best position to improve healthcare using ethical principles based on the fact that the healthcare reform requires ethical decision-making from leaders. The basic ethical principles and their implementation in the various relationships at different levels create an essential and successful change of the healthcare system (Bruning and Baghurst 2013).

## Healthcare Ethics

Healthcare ethics ranks within the field of applied ethics and deals with moral decision-making situations arising from practicing medicine in addition to the procedures and the policies that are designed to guide such practice (Taylor 2002). The world is rapidly changing, and new medical knowledge and technological advancements trigger new and important moral issues; therefore, healthcare professionals are constantly facing multiple challenges relative to ethical dilemmas (Taylor 2002; Bhanji 2013). Most conflicts occur between healthcare professionals and patients in connection with making the best possible medical treatment decisions, and nurses represent, in most cases, both the advocates and resources of the patients (Bhanji 2013). In these challenging situations, healthcare professionals use the ethical decision-making process, which is based on four healthcare ethics principles, namely, autonomy, beneficence, non-maleficence, and justice (Beauchamp and Childress 2001). According to those principles, it is possible to estimate the significance of the ethical decisions in clinical settings; however, it is important to note that these ethical principles may vary according to each situation. Additionally, it also depends on the laws governing the principle and the conditions applied (Bhanji 2013).

## Organizational Ethics

One of the most emerging fields dealing with the study and practice of the ethical behavior of organizations is organizational ethics (Ells and MacDonald 2002). According to Ells and

MacDonald (2002), organizational ethics, in order to be effectively applied to healthcare setting, needs to pay special attention to specific organizational characteristics, which must be combined with business and bioethical tools. Moreover, organizational ethics requires that values associated with political decisions or past practices are precisely defined and evaluated. Morally acceptable values must serve as policy decision guidelines, and morally unacceptable values must be revised, discarded, or excluded from policy processes (Ells and MacDonald 2002). Organizational ethics concerns patient care and public good, connecting the ethical principles of solidarity and subsidiarity while honoring the public's trust. It is important that governance deals with organizational ethics in order to ensure that the organization's values (reflecting its mission and identity) influence all aspects of the institution (Garvey 2015).

## Ethics Effectiveness

An effective leader is able to change himself in terms of the suitability of the changing needs of the team and person (Webster and Webster 2018). In the past, some very broad definitions of a successful leader appeared which are based only on the ability of the leader to bring about changes for better or worse (Ciulla 2012). In addition to bringing about changes and being successful at doing something, ethical questions, such as "Was the change itself good? What were the leader's intentions? Was it the right thing to do?" and "Was it done the right way?", always arise (Ciulla 2012). Additionally, Ciulla (1995) states in her work that a good leader acts both ethically and effectively; however, the reality is that some leaders follow high ethical standards in the course of their work, but are not very effective, and vice versa, they are very effective but not also ethical. *The Journal of Clinical Ethics* (2018) previously devoted many articles to quality in terms of structure, processes, outcomes, access, and effectiveness and also to ethics evaluation of consultations (Ibarra 2013). Two

questions about ethics consultation were identified by Tulskey and Fox (1996), namely, "Is it worthwhile?" and "Is ethics consultation effective?" (Ibarra 2013). Effectiveness was later defined by Fox (1996) as "the degree to which an intervention achieves its intended goals"; however, she is convinced that the goals of ethics consultation must be clearly specified in order to be able to evaluate ethics consultation effectiveness. With reference to who is responsible for integrating ethics within a healthcare organization, Dörries et al. (2011) claim that this is the responsibility of effective ethics committees, which should, according to Nelson et al. (2010), improve the quality of care by addressing the most important ethical issues at the system level with the collaboration of healthcare professionals, ethics committees as well as quality improvement professionals who should focus on less effective approaches with the purpose of focusing on concrete ethical issues on a case-by-case basis.

## Ethical Decision-Making in Healthcare Leadership

Leaders in healthcare sector are responsible for healthcare improvement by using ethical principles due to the fact that the healthcare reform requires leaders with ethical decision-making who can apply ethical principles to various relationships. Furthermore, the healthcare leader's influence also creates fundamental and successful changes in healthcare (Bruning and Baghurst 2013). According to Voges (2012), Professor Richard A. Culbertson described five precepts as the foundation of ethical decision-making in healthcare leadership, namely, beneficence, non-maleficence, respect for persons (autonomy), justice, and utility. Beneficence is the principle that considers the obligation of benefiting a particular institution and its staff, patients, and community. The second principle is non-maleficence, representing the obligation to bring no harm to the institution or patients, healthcare staff, or community, and the third is connected with protection and

preservation of the individual autonomy of those who are affected by leadership decisions and administrative practices, with a special focus on the autonomy of patients and healthcare staff. Justice represents the leadership's obligation to provide fair and unbiased decisions within the organization, and the fifth principle, utility, is a combination of the previous four with the purpose of providing the appropriate competencies within the decision-making process (Voges 2012).

## Health Economics and Ethical Decision-Making

To be able to rationalize healthcare policy and additionally increase the efficiency of the healthcare system, it is necessary to employ an economic evaluation tool which will enable relative efficiency of currently implemented healthcare programs. In order to maximize the effectiveness of the healthcare program, the cost of medical intervention is linked to its effects.

The medical intervention is usually evaluated according to the level of costs that it produces, meaning that high costs and low effects draw negative leadership conclusions in the sense that intervention is inefficient and contrary, while a medical intervention with low costs and relatively high efficiency is considered effective. It is important to note that cost-effectiveness of healthcare treatment represents a ratio between costs and effects; however, healthcare economists argue that the best treatment requires the lowest costs and the best possible patient outcome at the same time (Stolk and Busschbach 2002). It is therefore appropriate to examine how healthcare economists deal with and resolve ethical dilemmas that arise during the medical treatment since they are not qualified to make value judgments that are part of clinical decisions but could impact healthcare costs. Many researchers have been studying ethical complexity of incorporating costs into clinical decision settings (Pinkerton et al. 2002; Brock 2004), and it has been proven that cost-effectiveness analysis outcomes might negatively affect the ethical principles of equity and

distributive justice (Braveman and Gruskin 2003; Mshana et al. 2007).

## Ethics and Learning in Organizations

Ethical decision-making; Intrinsic learning; Operational learning; Relational learning

### Introduction

An organization, such as a business, a government department, a charity, or a club, is an organized group of people with a particular purpose. Although such a purpose is common among all individuals in an organization, the reasons and motivations that each organizational member has for achieving that purpose might differ from individual to individual (Pérez-López 2018).

This chapter discusses the impact of individual decision-making and learning on organizational learning and shows how ethical decision-making is critical for the personal development of people as well as to facilitate that an organization achieves its goals.

The chapter is mainly based on the research of Pérez-López (1991, 2018).

## Ethics and Learning

### Individual Decision-Making

A decision is the process of reaching a resolution after some consideration. Once a resolution is implemented, it produces some kind of change, whether it impacts a physical environment or the people, including the decision-maker, who are affected by the decision. Accordingly, three consequences of a decision have been identified: extrinsic, intrinsic, and transcendent consequences (Pérez-López 1991, 2018; Ariño 2005; Ferreiro and Alcázar 2019). Extrinsic consequences are those changes that occur in the external world due to a decision. Intrinsic consequences are those changes that a decision produces inside the decision-maker. Transcendent consequences are the changes that occur inside the people, other than the decision-maker, who are affected by a decision. Changes *inside* people refer to whatever might change in the interiority of a person, such as his or her feelings, ways of thinking or value system, being the person conscious or unconscious of such changes.

An example might help clarify these ideas. Two business school professors. One has been asked to moderate a roundtable at a forthcoming school event. On the day of the event, he has a family emergency and asks his colleague if he could take his place and moderate the roundtable. The second professor has other plans for the evening but decides to cancel them and responds positively to his colleague's request. The extrinsic consequences of the decision are clear; the first professor is able to address his family emergency, while the second professor cancels his previous plans and moderates the roundtable instead. By agreeing to do this favor for his colleague, the

second professor is exercising his amiability and has probably become more aware and attentive to the needs of others. These are the intrinsic consequences of his decision. In addition, because the second professor agrees to moderate the session, the first professor learns that he can count on his colleague and possibly increases his trust and gratitude. These consequences are the transcendent results of the decision.

Had the second professor not agreed to moderate the roundtable session, choosing to prioritize his own plans for the evening, all three consequences, extrinsic, intrinsic, and transcendent, would have been completely different.

Notably, when referring to intrinsic and transcendent results, the words “probably” and “possibly” have been added because these results are not externally observable and might or might not occur depending on the personal circumstances and mindset of each of the individuals involved in a decision.

### Individual Learning

Individuals learn by making decisions over time, and decisions, as underlined before, have extrinsic, transcendent, and intrinsic consequences. Individual learning can be classified depending on the consequences of any decision that leads to a particular type of learning.

### Operational Learning

To learn a new language or how to drive, two traits are necessary: rationality and virtue. Rationality refers to the capacity of thinking and planning needed to achieve the desired results. To learn a new language, a person must create a plan. He/She must decide which language would be best and whether he/she would like to have private or group lessons, online or face-to-face, and must find the right school or tutor and then pay the corresponding fees. However, none of these will be effective without virtue, that is, the willingness and capacity to bring the plan into practice. If, based on rationality, the final plan is to follow online lessons twice a week but then, due to lack of virtue, laziness takes over and the person does not attend any of the lessons, he/she will not learn. Virtue is the capacity, willingness, and strength to

follow a plan and to overcome any possible obstacles that might arise.

Nevertheless, rationality and virtue do not guarantee operational learning. Following the previous example, a person might plan to learn a language and might follow the necessary steps, for example, attending her lessons twice a week, and yet not learn much. This person would not have fulfilled her operational goal but nonetheless would have exercised her rationality and virtue, a nonnegligible personal development.

Operational learning is not inherently good or bad. Similar to how a person can learn a new language, a person can learn how to produce cocaine. Operational rationality and operational virtue would be necessary in both cases.

### Relational Learning

To purposefully make decisions that have a transcendent effect on other people, rationality and virtue, here, relational rationality and relational virtue, are also necessary.

An example where a professor agreed to moderate a roundtable to help another professor with a family emergency was introduced above. Let's now assume that the first professor, the one with the family issue, is usually a selfish and obnoxious man who hardly does any favors for his colleagues. The second professor, when asked for his assistance, might be tempted to say no, but perhaps he finally decides to agree to the change only to see if he can stimulate some transcendent learning in the first professor. If the second professor agrees, maybe the first professor will understand how important is to be collegial, will feel thankful and will, at his next opportunity, be nicer to his colleagues.

To accept the proposal from the first professor, the second professor needs rationality and virtue. Rationality entails that he considers whether agreeing to perform this favor might spark a transcendent change in the other person, which is the plan. In addition, the first professor needs virtue to overcome his initial impulse to say no to his disagreeable colleague, providing him with the capacity to follow the plan.

Again, simply because the second professor follows his plan does not mean that this plan will

be a success. The first professor might be so obstinate that the actions of the second professor might not have any effect. Nonetheless, the actions have undoubtedly had some effect on the second professor, the decision-maker, who has definitely improved his relational rationality and relational virtue.

#### Intrinsic Learning

Operational learning relates to the extrinsic consequences of a decision. Following the same logic, relational learning relates to the transcendent consequences of a decision. What type of learning thus relates to the intrinsic consequences of a decision? The answer is both. That is, whether a decision has extrinsic consequences, transcendent consequences or both, every decision will always produce intrinsic consequences. A decision changes the decision-maker.

Individual learning can be understood as the intrinsic result of the decisions that a person makes over time. Through his or her decisions, a person molds his or her character and way of thinking and therefore decides who to become.

Certainly, there are some external circumstances that are beyond an individual's control or influence and have an impact on the individual. For example, one's place and time of birth, the cultural and economic environment where one is raised or certain individual physical and intellectual capacities. However, regardless of these non-controllable external circumstances, each individual has the capacity to decide and, by deciding, to leave an internal footprint that will somehow guide his or her future decisions (Andreu 2014).

By deciding with rationality and virtue, regardless of whether the decision-maker achieves his/her desired results, the decision-maker is exercising his/her capacity to be rational and virtuous. Although both operational and relational learning are valid ways of individual learning and development, relational learning is especially important since it affects others and transcends the decision-maker. By making decisions using relational rationality and relational virtue, the decision-maker ensures that others feel valued and dignified, and these feelings might develop

into an increase in trust and strengthen their relationships.

When a decision-maker does not account for other people who might be affected by a decision, that is, when the decision-maker lacks relational rationality and relational virtue, negative learning might take place. Others might feel ignored and mistreated, their trust might be eroded and relationships might be damaged. In addition, such a decision-maker diminishes his or her relational ability, hindering the next application of it and likely making him or her a worse person than he or she was before.

Notably, intrinsic learning is not the same if achieved through operational or relational learning since the nature of rationality and virtue in each case is totally different. A person acquiring operational learning without taking care of the relational learning could potentially use his/her operational expertise to pursue his/her extrinsic benefit while hurting others.

#### Organizational Learning

Organizations are formed by people who coordinate their actions to achieve a particular purpose. A company's performance relies mainly on the performance of its employees. The stronger and healthier the relationships between the organizational members are, the easier it is to achieve a common goal. A lack of trust limits the number of possible alternatives to solve a given problem. Trust, empathy, and a willingness to contribute amplify the number of potential solutions to a problem.

Organizational learning, parallel to individual learning, can be operational or relational, good or bad. Positive organizational learning occurs when goals that were not previously attainable in an organization become possible (Nonaka and Takeuchi 1995). For example, the CEO of a local company believes that opening new markets and exporting goods to them could benefit the company but cannot do so because his or her employees either do not have the necessary knowledge (languages, strategies, etc.) or do not have the willingness to accomplish it (relocate, travel, motivation to learn, etc.). The CEO could thus develop a series of operational learning

strategies to train his or her employees in the new tasks and would also need to enhance his or her relational learning to understand why the employees are reluctant to change and to find strategies to improve the situation. If, as an organization, the CEO and the employees are able to increase their operational and relational learning, the organization will be able to successfully export their goods or services, which is not possible without such learning. Negative organizational learning would result in an inversion of this process. That is, organizations that were able to accomplish several objectives might no longer be able to do so once the people involved become unwilling to contribute as much as they did before. In such a case, a loss of confidence and commitment has reduced organizational learning.

Operational learning in an organization depends greatly on the degree of a delegation that is present in the organization. If employees' tasks are micromanaged, they never truly learn to perform their tasks on their own. Individuals need a certain degree of experimentation and freedom to learn effectively. This, of course, entails an associated risk of failure. Employees who are learning a new task will probably not perform it perfectly on the first day, but controlled failures are necessary for learning. Consequently, if an organizational culture heavily penalizes mistakes, employees will not be willing to attempt new tasks and bear the associated risks, which in turn will impede operational learning. Operational learning has a cost; it is probably cheaper, faster and more effective if a given task is performed by an expert rather than an employee who is learning. However, if a company is not willing to incur such learning costs, organizational learning will never occur. Such an organization will probably become obsolete, and its employees will likely lack professional development. Finally, a lack of professional development is not only an extrinsic consequence of a lack of operational learning but also a relational learning failure, since employees feel less engaged with all the potential consequences mentioned above.

Relational learning in organizations is the key for developing organizational culture and organizational atmosphere. If an organization considers

the impacts its decisions might have on other stakeholders, and especially on its employees, these employees will probably, though not certainly, be more willing to invest their time, effort, and knowledge in contributing to the organization's goals (Business Roundtable 2019; Malnight et al. 2019; Harrison et al. 2020).

While most organizations grasp the importance of operational learning for innovation and organizational development, not all understand the equivalent importance of relational learning. Relational learning implies evaluating the impacts of decisions on others. Caring about the learning that a particular decision will enhance or deter among others, that is, being conscious of the transcendent consequences of a decision, greatly depends on the values of an organization and of the people within it. How the CEO and managers of an organization make decisions, how they communicate those decisions and how they apply such decisions can align or misalign employees with the organization's values and mission.

## Conclusion

Since an organization is a group of individuals, individual learning and organizational learning are intimately related.

Given that every individual decision has extrinsic, transcendent and intrinsic consequences, managers, when making organizational decisions, should consider the impacts their decisions have on the world, on the people affected by their decisions, in most cases, their employees, and on the managers themselves.

## Ethics and Psychological Experimentation: A Historical Overview

### Introduction

Current psychological experimentation, which traces its roots to medical research, is guided by a set of overarching ethical ideals and governed by an appropriate oversight committee. The history within the field, however, reveals the slow

introduction of ethical principles into the research and treatment involving human subjects. While the origins of modern ethical conduct within experimentation may be traced back to Hippocrates, the subsequent years are witness to a period of both innocent disregard and intentional harm toward the experimental subject. It is only in the last 100 years that real progress has been achieved in the consistently evolving arena of ethical practice. History is witness to the slow development of ethical considerations highlighted across the Nuremberg Trials and numerous research scandals, eventually resulting in the Belmont Report and an accepted code of conduct in the psychological arena.

### Historical Starting Points

While the American Psychological Association’s Ethical Principles of Psychologists and Code of Conduct (APA 2002) outlines a solid, wide-reaching framework that guides both practitioners and researchers, the path of ethical behavior within the field has followed a tumultuous path. The current general principles provide an extensive list of ethical ideals designed to serve as guideposts within the numerous roles in which psychologists often find themselves. These include the principles of beneficence and non-maleficence, fidelity and responsibility, integrity, justice, and respect for people’s right and dignity (APA 2002). However, the psychological and psychiatric professions are complex and include the entire range of potential human behavior. As the fields have developed, the past century has been witness to both unintentionally harmful experiments and purposeful atrocities in the name of human advancement. This account chronicles the progress that has been made, detailing the key events which have culminated in our current state of ethics within the profession.

The consideration of a humane approach by a treating physician is practically as old as the medical profession itself. During the School of Kos in 400 BC, Hippocrates developed the oath that treatment, at minimum, should “do no harm” (Rest and Narváez 1994). While not overly

elaborate, this ideal implied a respect for life as well as the patient. Although it provided a good starting point, its simplicity did not provide much support to address the wide range of potential actions within the field. Even today, it is not clear whether the Hippocratic Oath applies solely to treatment or whether it also includes research and experimentation. In fact, many questions remain, such as whether the benefit to society outweighs the benefit to the individual, potentially terminal, patient.

Fast-forward 2300 years to the advent of modern medicine. Such advances corresponded with a rise of experimentation in the field of psychology. In 1892, the teachings of the early pioneers of psychology, such as Edmund Sanford, Harvey Carr, and Edward Titchener ushered in an era headed by the “experimentalists.” Researchers, such as E. W. Scripture, were beginning to establish psychological laboratories. In an attempt to emulate scientists from other fields, the behaviorists who followed hoped to focus solely on observable facts and data in order to quantify and operationalize psychological concepts. They introduced the terms of “subject” and “observer” to their research and referred to participants as “organisms” (Morawski 1988). In this sense, the individual was depersonalized and lost a sense of identity during experimentation.

Along with such experimentation came the creation and overall adherence to ethical standards within the profession, which arose primarily within the twentieth century. As an attempt to educate and protect the participant, the concept of informed consent originated in 1900 out of experiments conducted by Professor Neisser who purposely gave his subjects, mostly prostitutes, syphilis without their knowledge in an attempt to create an anti-syphilis serum. As a consequence, the governing board at the time, the Royal Disciplinary Court of Prussia, fined the doctor an amount equal to two-thirds of his annual income (Slovenko 2005). The concept of informed consent would not enter the US legal arena until almost 60 years later.

The intervening years saw some significant setbacks pertaining to ethical behavior within the scientific fields. Even preceding the atrocities of

Second World War, the eugenics movements gained strength in the USA through the funding of such industrialists as Andrew Carnegie and John D. Rockefeller, Jr. The rights of individuals took second place to societal benefits in an ill-conceived plan to selectively create a healthier, more intelligent group of people. In 1927, the US Supreme Court supported this view by ruling that eugenic sterilization was constitutional (Slovenko 2005). The overall ethical climate proved rather bleak at the time within the USA. This included segregation, a prohibition on interracial marriage, the outlawing of homosexual behavior, harmful experimentation on prisoners, and sterilization by the thousands.

## Influence of War

The 1930s saw the rise of Hitler to power in Germany and his subsequent attempt at cleansing the population, racial design, and “applied biology” in order to create a perfect race (Slovenko 2005). The overall sentiment was that certain people were expendable at the benefit of others. Ethics in research took a backseat, if it was even given any consideration at all. The horrifying treatment of fellow human beings during the Second World War, especially as practiced on prisoners, within Nazi Germany, the USA, and Japan, among other places, sunk to new lows. Appalling experiments were forced upon people under the guise of medical and psychological advancement.

Real change did not occur until after the war ended. The aftermath of inhumane behavior led to the Nuremberg Trials in 1947, which included “Doctor’s Trial,” also known as the “Medical Case.” The objective was to establish the culpability of 23 German physicians under “the principles of the law of nations as they result from the usages established among civilized people, from the laws of humanity, and from the dictates of public conscience” (Slovenko 2005). In essence, the trials were laying the framework for a universal standard when human experimentation was necessary. The direct outcome was that 15 of the 23 doctors on trial were sentenced to death. A key component that emerged from the ten-point

Nuremberg Code included the overarching ideal that science should never take precedence over the rights of the individual subject. As such, the concept of voluntary consent emerged as an essential component in all human medical research.

Shortly following the war in 1953, the US Secretary of Defense held up the Nuremberg Code as an example to follow with research that involved atomic, biological, and chemical warfare. Unfortunately, his edict was declared confidential. However, the 1953 version of the APA Ethical Standards of Psychologists introduced the key elements of removing the stressful components of the experiment at its conclusion (Morawski 1988). In addition, it added that participants should be informed that they could withdraw from an experiment if it involved harmful effects. Furthermore, the use of deception was to be limited to cases where it was deemed necessary to the experiment itself (Herrera 1997). Although many of these ideas were developed to bolster informed consent, the essential components of today's debriefing methods were still lacking, including informing the subject as to the experiment's purpose. Furthermore, participant reactions to the experiment were ignored. It was not until much later that researchers were guided to elicit a subject's impression and explain any manipulation to reveal the true nature of the experiment. The first legal case in the USA involving informed consent arose shortly afterward in 1957 which determined that failure to inform constituted battery (Slovenko 2005).

While they provided a starting point, the Nuremberg Trials did not eliminate all ethical problems within the medical and psychological research. Around 1959, the director of research at New York State Psychiatric Institute, Paul Hoch, began administering Lysergic acid diethylamide (LSD) and mescaline to his patients suffering from schizophrenia without their consent with the goal of studying the bio-chemistry underlying psychosis (Slovenko 2005). Furthermore, the 1964 Declaration of Helsinki made no mention of consent even though the concept had played a pivotal role in the Nuremberg Trial. In fact, it was not added until the updated version 1975.

## Post-War Advancements

In the USA, the real impetus for ethical standards in experimentation was the result of research scandals which prompted political change in order to protect subjects. In 1966, a researcher at Harvard Medical School published an article that focused on 22 examples of questionable experiments, which gained public attention and influenced the discussion. Shortly thereafter, the now infamous Tuskegee syphilis study, which had begun in 1932, became public and "moved the U.S. towards a systematic formal regulation of research standards" (Slovenko 2005). Spurred by these revelations, the US Congress approved the National Research Act in 1974 which created an advisory board known as the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research (Hamilton 2005). This legislation required studies funded by Department of Health, Education, and Welfare to be reviewed and approved by committees. Moreover, it formed the basis for federal regulations that authorized the system of Institutional Review Boards (IRBs). It is the role of the IRB to evaluate each submitted research proposal to determine whether it is designed to "protect the rights and welfare of its subjects" (Slovenko 2005). The board has the responsibility of ensuring that research volunteers will be well informed, so that they are aware of their right to participate or stop at any point. The participants should know what kind of research is being conducted, the time period involved, the list of potential risks as well as any possible benefits.

Out of the National Commission's efforts examining the ethics of human research, the Belmont Report was published in 1979 and focused on three primary concepts in evaluating the ethics of a research project. These included respect for persons, beneficence, and justice (Roberts et al. 1998). According to the report, respect for persons encompasses the participant's autonomy and voluntary decision to partake in the research. In this sense, it is the responsibility of the researcher not only to fully disclose all information pertinent to the project, but also to make sure that the subject understands the information. This definition excludes certain vulnerable populations from

participation. Secondly, beneficence dictated that the research design of a project be scientifically sound, cause the minimal harm possible as well as the maximum benefit to the individual. In essence, the principal of beneficence underlines the importance of safeguarding the well-being of the participant. Finally, the principle of justice affirms that all participants are treated equally, that none are favored over others, and those who choose to undergo the largest risk also receive the largest benefit.

## Human Subjects Protections

In many ways, the Belmont Report (1979) laid the foundation upon which future federal regulations involving the protection of human subjects was built, in part because it delineated research from clinical practice. It made a clear distinction that research could not be disguised as treatment. If future treatment was a possibility, it must be labeled as experimental. Terms such as “innovative treatment” or “non-therapeutic research” must be used and clearly state that they may generate general knowledge, but that they were not designed to help that specific subject (Hamilton 2005). While the IRB had its roots in medical research, this division established that IRBs would only be responsible for monitoring experimentation not meant to benefit a human subject, rather than experimental treatments (Roberts et al. 1998). Of course, while IRBs cannot perfectly predict the outcomes of all experiments, they do serve an important role in keeping ethical considerations at the forefront of the researcher’s mind.

The principle of informed consent is a complicated area in itself. The required forms can be lengthy and confusing, risks may be unknown, and the patient may not even be capable of understanding; if they are depressed, for example. Some cases of informed consent may actually be set up to protect the researcher more than the subject. Research has shown that the close relationship between physician and patient can cause additional confusion (Rest and Narváez 1994). The idea of “therapeutic misconception” is rather

common, in that the patient believes that his/her physician always has his/her best interest in mind (Stevens and Pletsch 2002). Studies have revealed that even research patients can carry strong expectations of personal therapeutic benefit within the psychiatric arena (Appelbaum et al. 1982).

## Advent of Informed Consent

The principle of informed consent was put to the legal test in 1990 during the *Moore v Regents of the University of California* trial (Slovenko 2005). In this case, the California Supreme Court ruled that doctors must use informed consent to reveal any risks, benefits, and alternatives to a particular medical treatment. In addition, the doctors involved must also disclose any economic benefit which they might reap from their research. In the end, the court ruled that most reasonable people would want to know if the physician had a financial stake in the project.

However, there are limits to consent. For example, the principle of autonomy does not take precedent over other principles. As such, there is no defense to the charge of murder or purposeful, serious injury – even if it is in the name of research. Nevertheless, the door is left generally open to willing and comprehending patients. In fact, much progress has come from human research, including drug trials, cancer treatments, and psychological evaluations.

Within many experiments it is often inherently difficult to address the myriad of potentially confounding factors. Social experimentation often uses a laboratory as a controlled environment which includes the requisite elements of the outside world. Iatrogenic factors, such as the Hawthorne effect, may necessitate deception within the experimental design. Moreover, the researcher or physician is already perceived as having more authority than his/her subject. This discrepancy may be even more pronounced with vulnerable populations such as the elderly, children, minorities, or college students (Stevens and Pletsch 2002). Few modern experiments galvanized this issue as clearly as Stanley Milgram’s 1963/1964 experiments which truly showcased

“psychological experimentation and the use of deception in research” (Morawski 1988).

In an effort to protect subjects, the ethical concept of debriefing was a late arrival on the experimental scene. As recently as 30 years ago, it was not a standard practice even when an experiment produced distress and was dependent on deception. A cornerstone of the Milgram experiments, the idea was first included in the *Handbook of Social Psychology* in 1968 (Korn 1997). From there, it gained more widespread acceptance in the 1970s within the overall movement toward education participants. In 1973, the APA recommended that all experiments should be followed by a session of explaining the methods and purposes of the experiment (Morawski 1988). Such control was deemed necessary to avoid experiments getting out of hand and causing lasting effect on participants, as shown with the Zimbardo prison experiments. Today the process of debriefing is universally employed as a requirement of the IRB.

The field of medicine and psychology are rife with ethical decisions, as well as the potential for exploitation of people, both innocently and intentionally. These considerations make the establishment of a comprehensive set of ethical principles imperative. The implementation of such principles remains an evolving process. While much progress has been made, the field continues to develop. Some situations remain inherently ambiguous, such as how to ethically develop treatments for Alzheimer’s patients, those suffering from depression, and those with diminished capacity or psychosis. Nevertheless, examples of unethical behavior continue, including the unauthorized posthumous publication of records, controversial use of the placebo, and scientifically necessary but dangerous “wash-out” periods in medication trials (Roberts et al. 1998).

## Learning from the Past

The APA continues to refine the ethical principles that govern both research and treatment. In 1991, a full 100 years after the APA’s founding, its Committee on Standards in Research expanded

the documentation on the conduct of human research based on recent studies. Areas for improvement, such as informed consent, show that many subjects either do not understand or do not recall the forms which they read. This process is further complicated within vulnerable psychiatric populations. Patients, such as those with cognitive impairments or degenerative disorders, may be offered other possibilities, such as consent by proxy.

Exploitative behavior of the past by researchers and physicians stand out as glaring examples of what to avoid. For example, Roberts et al. (1998) pointed out that drug companies often competed for access to prison populations throughout the 1950s in the USA. In 1969, almost 85% of all new drugs coming on the market were tested within 42 prisons. Even as recently as 1975, some 3600 US prisoners were used by drug companies as the first subjects on whom the safety of new medication was proven. As a result of this, as well as other federal government testing on inmates, the Department of Health and Human Services (HHS) now limits inmate involvement in clinical experiments to those which present minimal risk and inconvenience. Furthermore, the research must primarily affect those within the prison populations and be likely to benefit the prisoner partaking in the research.

Kitchener (2000) describes five foundational principles for research to include autonomy, beneficence, nonmaleficence, fidelity, and justice. Viewed in the historical context presented above, one can see the source of these ideals. Of course, further recommendations for improvement exist within the area of ethical development in research and treatment. Refinement of the current set of codes requires constant evaluation as new scenarios arise, such as the potential transmission of HIV between partners (Bloch and Pargiter 2002). To address some of these new situations, Roberts et al. (1998) suggest four encompassing imperatives for researchers: (1) that they must give adequate consideration to obtaining informed consent, (2) that they must be conscientious and compassionate in all of their work involving human subjects, (3) that they must not use exploitation by placing subjects at risk without the

possibility of equal gain, and (4) that they must keep comprehensive and accurate records of all of their behavior. Other areas for improvement include increased educational development, further empirical investigation, and policy initiatives aimed at universal implementation (Roberts et al. 1998). Perhaps Oliver Sacks provided the most important overall ethical principle that psychologists and physicians should restore the individual human identity to the center of their research (Morawski 1988).

## Ethics and the Business of Sport: The Lance Armstrong Case

J. Angelo Corlett

Philosophy & Ethics, San Diego State University, San Diego, CA, USA

## Synonyms

Compensation; Cycling; Doping; Lance Armstrong (Lance Edward Gunderson); Punishment; Responsibility

## Introduction

After several years of public and private wondering about the doping status of perhaps the most popular figure in cycling history, it has recently been confirmed by none other than Lance Edward Armstrong (born Lance Edward Gunderson) himself that he used performance enhancing drugs to reach his level of success and the popularity that resulted from his cycling successes.

## Punishing Lance Armstrong

Now that he has taken responsibility for his doping, what more, if anything, should befall him in

terms of punishment for his actions which occurred prior to any relevant legal statutes of limitations with regard to his wrongful and harmful actions? In order to address this question fairly, it must be borne in mind that Armstrong did not just violate social norms, say, of setting a good example (for children and other adults) of honesty. He did not simply commit moral wrongs of not abiding by the rules of fair play. Nor did he merely fail to act according to some matters of social etiquette. Far greater than these important violations, Armstrong committed a range of felonious crimes ranging from lying to the USADA and to the ICU about whether or not he doped, and in accepting the winnings and endorsements that followed his victories he effectively, intentionally, voluntarily, and knowingly swindled various businesses, agencies, and his clean competitors out of several millions of dollars which Armstrong would have never received had he either not doped and failed to win the most prestigious events in cycling or had been caught or admitted to doping and had been punished appropriately at the outset of his doping. Indeed, Armstrong is reported to possess a current net worth of about \$100 million in assets, and it would appear reasonable to think that he would be in possession of almost none of it had he not committed countless acts of fraud as he was not independently wealthy prior to his several acts of doping.

I shall assume herein that Armstrong was not forced by a credible threat of death or the like to dope and that as his confession, however genuine and accurate it might turn out to be, indicates, he did so knowingly and intentionally in order to win the events in which he participated. In so doing, his conduct was faulty as it violated norms of fair play. There can perhaps be no better example of crimes that were committed while satisfying strongly the conditions both necessary and sufficient for criminal and moral liability responsibility than those committed by Armstrong. So it is reasonable to assume that he is responsible for his crimes, which implies that it is reasonable to consider him to be a punishable agent as the conditions of criminal and moral responsibility are voluntariness, intentionality, guilt, fault, and knowledge (Corlett 2014: Chapter 1). I also assume that Armstrong should not receive special

treatment; he should be treated as the criminal that he is, without regard to his color, financial status, or the popular status that he has fraudulently attained. Among other things, this implies that whatever punishment he is to receive should not amount to either a significant over punishment or a significant under punishment. What we are after here is nothing short of reasonable though approximate justice for his many crimes, without excuses or attempts to forgive and have mercy on him for whatever reason.

The question of this investigation is what manner of punishment is befitting Armstrong of his crimes. How ought Armstrong to be punished if justice and fairness are to be our guides? By “punishment” I mean to include a variety of legal and other institutional sanctions against him, including but not limited to compensatory criminal fines, imprisonment, legal settlements, and banishment from participation in certain social activities even should he somehow live to serve his deserved prison sentence, whatever that might be.

While it is true that “it might also be appropriate for law enforcement to play a role in testing to deal more harshly with the illegal nature of some performance-enhancing substances” and that “There also needs to be a deeper investment in testing...,”<sup>1</sup> opinions on how to further punish Armstrong who cheated by way of doping<sup>2</sup> his way through most of his cycling career (indeed, leading a massive program of doping throughout his cycling career) range from the idea that he ought not to be punished because, after all, it is believed, all cyclists dope, to the ICU’s following the ruling of the USADA to strip Armstrong of his seven Tour de France titles from 1999 to 2005 and erasing his name from the record books and banning Armstrong from the sport of cycling

<sup>1</sup>Quoting WADA General Director David Howman and Don Catlin of the IOC (respectively) in Pugmire (2012).

<sup>2</sup>In this essay, I assume what is argued for elsewhere, namely, that doping in sports is morally wrong: Corlett et al. (2013).

<sup>3</sup>For a description and commentary on Herman Ram’s summation of the USADA’s decision on the Armstrong case, see Wilms (2013). Herman Ram is the CEO of the Anti-Doping Authority of the Netherlands.

forever,<sup>3</sup> to a suggestion that he ought to be humiliated by having him pay for the erection of a statue placed in a kind of “cheater’s square” that essentially admits that he is a cheater (Liguori 2012).

While humiliating cheaters like Armstrong is certainly a deserving punishment for his wrongdoings (it is, frankly, the very *least* that should be done to wrongdoers of a serious kind), having him pay for the erection of a statue admitting his wrongdoings is hardly a sufficient punishment for what he has done and grossly violates any plausible principle of proportional punishment.

While the ICU’s stripping Armstrong of his seven Tour de France titles and erasing his name from the record books and banning him from cycling for life are significant, they are hardly a proportionate punishment given the range of harms he has caused to various agencies, businesses, and the various individual cyclists who choose not to dope and would have won had only clean competitors such as the Christophe Bassons’ been awarded prizes and endorsements. But that would require of the sport’s governing body an adequate commitment to honesty and fair play. However, the ICU has announced that only a full confession by Armstrong will trigger its possible reconsideration of its decision. Indeed, a possible reversal of its decision? Given the historic nature of Armstrong’s felonies, it is morally interesting that the agency would even consider a reversal or revision of its already inadequate decision.<sup>4</sup> One might think that in light of that ongoing moral atrocity, the ICU would seek to punish harshly, though reasonably, dopers within its sport, in what is clearly the most morally and legally devastating event in its history.

Whatever the case, one concern is what the morally and legally right things to do are

regarding this case. It is not a concern for the economic well-being of anyone except the several victims of Armstrong’s crimes. And for the sake of brevity, I ignore in the category of victims the general public and children who are psychologically effected by what he did, as that is not a compensable harm. I shall focus on compensable harms, or, at least, a small number of them in order to provide a sense of the magnitude of what Armstrong owes to those he has harmed most.

For those clean cyclists who should, but for some reason will not, be moved up the list of official finishers accordingly, the ICU will list “no winner” for those 7 years that Armstrong crossed the finish line ahead of every other competitor illegally. This is hardly fair, as not only did Armstrong steal several millions of dollars and fame from his cheating; he also now has in the end prohibited certain clean cyclists from winning, as the case may be. And if it is too embarrassing for the ICU to, as it may turn out, go very far down the list of finishers in those tour events to find the clean winners, then perhaps that embarrassment is deserved and could have been averted had the it done its antidoping job in the first place. Or is the ICU seeking to hide evidence that it ought to have not ignored the wide-spread suspicion of doping in its sport because it would have cast a shadow on the sport and had dire economic implications for cycling and the ICU? Thus, to the extent that Armstrong is permitted to continue to benefit from the millions he stole as ill-gotten goods, the ICU and the USADA will continue to allow him to flaunt the venerable legal doctrine that no one should be permitted to profit from one’s own wrongdoing. As one writer puts it of Armstrong’s cheating: “. . . It made him rich, friendly with presidents and pop stars” (Leicester 2012).

What is needed is a consideration of at least some of the plausible principles of punishment and an application of them to the Armstrong doping case. First, as noted, *no one should be permitted to benefit from their own wrongdoing*. So the approximate amount of Armstrong’s financial benefits as the result of his cheating must be calculated. In this case, the amount would range into the several millions of dollars, as he has defrauded several individuals and businesses.

<sup>4</sup>“Inadequate” not so much in terms of the rules and regulations of the said agency, but rather in terms of what Armstrong deserves in light of what he has done. Perhaps the agency lacks the wherewithal to inflict on Armstrong a punishment that he deserves. But it is curious that it seemingly lacks a punishment along the lines of several millions of dollars in fines for committing such harmful wrongdoings. Whatever the reason for such a deficiency of justice, the aim of this essay is to provide a reasonable sense of what Armstrong deserves given his crimes.

Then, *in accordance with a general principle of proportionate punishment and compensation, every asset of Armstrong's must be seized in order to establish a fund in order to assist in the compensation of the compensable victims of his doping.* In most cases such as Armstrong's, there are insufficient funds to adequately compensate the compensable victims (the "shallow pockets" problem), so a prison sentence must be handed down in order to coerce Armstrong to work at prison wages all of which would be used to rectify his victims.

One question is, given US federal prosecutorial discretion, whether or not the US legal system has the moral wherewithal to level formal charges against Armstrong for his harmful wrongdoings. It has been reported that Armstrong's attorneys have already made a settlement offer of a few million dollars to the US Department of Justice, an offer that was quickly and roundly refused on the grounds that the Justice Department estimates Armstrong's illegal takings to rank closer to about 10 times the amount (\$30,000,000 USD). It is unclear precisely how the Department of Justice arrived at this figure, or whether or not it includes the wide range of compensatory harms I have already noted. My guess is that if Armstrong is tried and found guilty and sentenced according to these and other relevant legal principles of compensatory justice, he would clearly not be able to repay all of what he owes to his victims. In addition to this measure of justice, prior to his being taken to prison Armstrong could be forced to cut the ribbon on the statue ceremony that demonizes his efforts as a cyclist. But something like what I have proposed will begin to suffice as a proper punishment for Armstrong in light of the extent of his doping and the harm that it has caused. So the extent of Armstrong's frequent felonious fraud justifies, on moral grounds, that he be sentenced to and actually serve the remainder of his life in prison, right alongside others who have committed similar crimes of felonious fraud. For as Aristotle famously stated, like cases should be treated alike, dissimilar cases should be treated dissimilarly. This implies, among other things, that there is to be no special treatment of anyone in considerations of justice and fairness.

## Objections and Replies

Now for some people, what is being argued here appears overly harsh. It is just a sport, they would say, and besides, what real harm did Armstrong cause by doping? Who did he really harm? Other doping cyclists? Surely they are not, it might be argued, innocent victims of Armstrong's doping. Moreover, they might add, let us not forget that Armstrong founded a major cancer-fighting organization, Livestrong, which does a great deal of good for many suffering from that dreadful disease. So whatever is done to punish Armstrong, it is argued, ought to take into consideration these sorts of factors. Sentencing Armstrong to prison (especially a life sentence) is too harsh a punishment, especially in light of his raising so much money to fight cancer. Justice, it might be argued, requires that such a punishment not be meted out to him, as that would not maximize social utility in this case.

However, this attitude toward Armstrong's crimes is problematic for the following reasons. First, it rests on the myth that Armstrong founded Livestrong in order to combat cancer. However, this is a misleading claim. One would think that an organization that has as its primary aim to combat cancer would devote itself mainly, though not exclusively, to the task of raising funding for cancer *research* as that is clearly the primary manner in which cancers will be either managed or cured. But Livestrong, it turns out, gives surprising little of its donations to cancer research. Instead, as one investigative reporter puts it: "Much of the foundation's work ends up buffing the image of one Lance Edward Armstrong, which seems fair—after all, Livestrong wouldn't exist without him. But Livestrong spends massively on advertising, PR, and 'branding,' all of which helps preserve Armstrong's marketability at a time when he's under fire. Meanwhile, Armstrong has used the goodwill of his foundation to cut business deals that have enriched him personally, an ethically questionable move" (Gifford 2012).

In further reply to the permissive attitude toward punishing Armstrong, we should bear in mind that NFL quarterback Michael Vick served

prison time for his role in a dog fighting ring. No doubt he deserved some sort of punishment for that crime. No offense to the dogs which were killed and otherwise harmed by Vick's involvement, but does that really amount (in strictly economic terms) to much compared to the amount of harm that Armstrong has wrought on an entire sport, and the many clean athletes in it, not to mention the sponsors he fooled into essentially stealing from them millions of dollars per year in endorsements? The point here is that if legal precedent and fairness mean anything, and if Vick was justly punished for his crime (I shall assume this for the sake of this discussion), then surely the amount of harm that Armstrong has perpetrated makes Vick's crime pale in comparison insofar as the economic value of the crimes are concerned, making Armstrong deserving of a significantly harsher prison sentence in order to be forced to work off the remainder of what he owes to his compensable victims after his current assets are seized in order to provide initial compensation to his victims.

Just who are Armstrong's victims? They are many, including, as I mentioned above, the fans of the sport. But his *compensable* victims include but are not limited to NIKE, which is owed by him millions of dollars in endorsements insofar as Armstrong's doping over several years violated his endorsement contract with NIKE (I assume that his contract with NIKE includes a morality clause that implies the breaking of the contract should Armstrong engage in untoward behavior, doping being one such behavior). Not only does Armstrong owe NIKE (as well as Anheuser-Busch, Oakley, Radio Shack, the USPS, and some other businesses for similar reasons), but he owes the sport of cycling, including but not limited to the ICU and the IOC, for flaunting their rules and regulations. And for those who assert that Armstrong's doping was a "victimless crime," there are the clean cyclists many of whom would have won the yellow jerseys and various lucrative endorsements from 1999 to 2005 had *they* won the Tour de France instead of placing behind Armstrong and perhaps a cast of other dopers. How many millions should *they* have earned over how many years instead of

Armstrong who ended up effectively stealing their hard-earned awards? These are just some of those harmed by the cheating of Armstrong. Time will tell how many other victims will reveal themselves in legal actions taken against Armstrong. And let us not forget those he bullied publicly and threatened with law suits and publicly defamed when they sought to bring his felonious undertakings to light. That Armstrong was deliberate and brazen in his fraud is beyond reasonable doubt in light of his own confessions. To deny that rarely has the world of sports witnessed such a scoundrel is to engage in a level of disingenuous discourse that disqualifies one from being taken seriously on this important matter.

Again, in light of the fact that Armstrong can never even reasonably hope to adequately compensate those who he has harmed and to whom he owes compensation, it is likely that what amounts to a life sentence is in order. The bill for the approximate remainder amount of compensation he owes to those he has harmed and warrant compensation can be presented to him upon entering prison, and he can work off every dollar at a prisoner's wage until he pays it off, essentially amounting to a life sentence. He should not be provided with special treatment, regardless of the cries of those who continue to support him due to his efforts at raising funds to address cancer.

For those who still countenance the idea that Armstrong's charity work somehow mitigates his responsibility for repeatedly doping and knowingly, intentionally, and voluntarily cheating various others out of millions of dollars a year and for several years, without regard for the consequences of his actions, the following point is in order. Armstrong's work with Livestrong is irrelevant to the basic facts of the case, unless, of course, one also believes, by parity of reasoning, that Jerry Sandusky's prison sentence ought to be significantly reduced or even eliminated due to *his* work with the charity that *he* founded and to which he attached *his* name. Or take the case of one who commits major Wall Street fraud or embezzlement in the several millions of dollars. If we truly respect the idea of approximate proportionate punishment, would we not expect her to compensate those whom she has cheated by

paying them what she took from them, however approximately? And if she is unable to do so, would we not think that she should be sentenced to prison in order to work off what she owes to *her* compensable victims? Then ought we not to apply the same sort of reasoning to Armstrong, unless, of course, one is predisposed against doing so because of his “good deeds” with a certain charitable organization? Yet if one is just so predisposed, then the point about Sandusky applies even in light of the differences between the two cases, revealing a degree of moral hypocrisy of those who would agree with Sandusky’s sentence but not with the sentencing of Armstrong to prison. If justice and fairness mean anything, they ought to mean more than the morally weak cries of those who are far more committed to forgiveness and mercy of a popular figure than they are to doing the right thing in a case that speaks ever so loudly to the greed of an individual who stole millions each year for several years and reaped the benefits from it, while those clean athletes who really won the races in question wherein Armstrong cheated (the clean and next to the finish line cyclists competing against Armstrong and the other doping competitors) had their hard fought victories and the rewards thereof taken from them forever by a thief of the highest cycling order.

Those who strain moral credulity to find some manner by which to significantly mitigate Armstrong’s deserved punishment must clear their eyes of the fog of permissiveness to glimpse, if they can, that Armstrong committed felonious crimes of a fraudulent nature that no amount of legal cancer-fighting could ever forgive. Besides, it is the desire for cancer to be wiped out that should have been the primary, if not exclusive, motivation for those supporting Livestrong, not the desire to do so because Armstrong said they should. It was not a moral error or misfortune that Livestrong succeeded to help fight the war on cancer. But neither does it excuse or forgive Armstrong’s devious and incessantly fraudulent undertakings. In other words, Armstrong’s work with Livestrong is morally irrelevant to how he ought to be punished for his crimes, and should be judged that way if reason is to have anything at all

to do with the moral assessment of his actions over the past decade or so. Rights [in this case, of Armstrong’s compensable victims’ rights] are not to be bargained away for considerations of social utility. They are moral and ought to be legal guarantees against those who would violate them for whatever reasons (Rawls 1971: 3–5).

Why should Armstrong be permitted to live one more day without attempting to adequately compensate those who he has harmed most in order to obtain his grossly ill-gotten goods? Justice and fairness demand that Armstrong be punished in (albeit approximate) proportion to the harms that he has wrongfully wrought on others. And if justice and fairness are given their due in this case, perhaps the ICU and the IOC can begin to get back on the saddle and begin peddling in the right direction and into a brighter future of sound competitive cycling reforms.

## Conclusion

Only history will tell whether or not Armstrong will be held adequately responsible for his crimes, or whether his greed will be mostly overlooked because too many people lack the moral integrity to do the right things to him in light of the facts of the case. And the fact that the sports world has yet to devise serious punishments for such crimes sends the message that it is more concerned with its fiscal viability than it is concerned with justice and fairness.

judgment, reporting, and documentation. An audit is independent when someone who has no interests on the results of the audit performs it. This is the case when the auditor is not part of the scope, clientele, or user of the audit. An audit is also objective when it is honest and unbiased. A systematic, independent, and objective examination and evaluation provide essential conditions for the users of an ethics audit to trust the conclusions of an audit.

An audit being systematic, independent, and objective makes it different from a review, check, screening, assessment, or monitoring, which are all lighter types of examinations. Therefore, a professional qualified to conduct an audit – i.e., an auditor – conducts an ethics audit.

### Definition of an Ethics Audit

There are many types of audits used by and for organizations, such as financial audits, quality audits, project audits, operational audits, performance audits, and ethics audits. An ethics audit is the systematic, independent, and objective examination and evaluation of the ethical content of the object of the audit.

An audit is systematic when it entails typical steps like planning, defining a framework, field-work (collecting information and obtaining evidence) using established methods, analysis,

### The Objects of an Ethics Audit

An ethics audit can have many different types of objects. Kaptein (1998) discusses six kinds of ethics audits, thereby distinguishing the scope of an ethics audit in terms of the intentions (input/efforts/characteristics), behavior (throughput), or consequences (output/results/impact) as the object of the audit, which follows the main distinction of ethical theories in terms of virtue ethics, deontology, and utilitarianism, respectively. Furthermore, for each of these objects (the what), a distinction can be made between the organization as the object and the external stakeholders of an organization as the object (the who). First, the three objects of the organization will be discussed.

An organization's internal ethical context reveals that organization's intentions. The internal ethical context refers to those organizational factors that stimulate managers and employees to behave ethically. The internal ethical context contains both formal and informal parts. The formal part consists of the different measures and activities an organization takes on to stimulate ethical behavior, for instance, its ethics and compliance program, which usually comprises of a code of ethics, training in ethics, an ethics office(r), and a whistleblowing policy. An ethics audit can examine the quality and effectiveness of such a

program. An ethics audit can also examine other elements of the formal context, such as the procedures, policies, systems, and rules (so-called hard controls), to evaluate whether they absorb the ethical risks an organization faces and whether they stimulate managers and employees to behave ethically.

The informal ethical context of an organization is usually divided into its ethical climate and ethical culture. The former refers to the shared opinions of the managers and employees of the organization about what constitutes ethical behavior, and the ethical culture is the shared experiences of the managers and employees of the organization about the conditions that stimulate ethical behavior. Auditing the ethical climate and culture of an organization is about examining what managers and employees think and believe about ethics in their work.

Regarding the behavior in an organization, an ethics audit can focus on the behavior of one or a limited group of individuals. This is usually what happens when there are indications or allegations of unethical behavior (such as signs of bribery, theft, and fraud). In such cases, an investigation, also called a forensic audit, is conducted to determine who has behaved unethically and to what extent. The behavior of managers and employees can also be the object of an ethical audit to examine the behavioral patterns. The inquiry will then be about the behaviors they have in common and the factors that explain these patterns. For example, when most employees frequently arrive late for meetings, the driving factor could be their view that punctuality is not important. An ethics audit can also focus on the ethical content of products and services delivered by an organization, to examine whether they meet some ethical criteria, for example, those of sustainability, human rights, and transparency.

The effects or outcomes of an organization can also be the object of an ethics audit. Such an audit may examine, for example, the stakeholders' perceptions about the organization (e.g., their experiences, satisfaction, and trust) or more factual data, such as the impact on the environment, fines, and stakeholder retention.

An organization can also do an ethics audit of its stakeholders. As part of due diligence, an organization can assess the ethics of suppliers, contractors, third parties, and acquisition candidates. There can also be ethics audits on applicants and prospective employees; these are usually called pre-employment screening and background investigations. Auditing the ethics of others can concern their intentions (such as the ethical awareness of applications or the quality of the ethics program of suppliers), their behavior (such as their criminal record), and the consequences of these (such as their social and environmental impact).

## Objectives of an Ethics Audit

An ethics audit can have many different objectives, some of which are:

- To show that ethics is important (by conducting this kind of audit the organization shows that it is willing to invest time and money in ethics)
- To make ethics tangible (when the audit uses concrete criteria and its results provide a clear picture of whether and how these criteria are met)
- To show that the organization is willing to improve ethics (when an ethics audit shows that there is room for improvement and the organization acts upon these results)
- To show to the respondents of the ethics audit that the organization is receptive to their opinions and experiences (when their opinions about the ethics of the organization are solicited)
- To comply with external expectations (Some jurisdictions, like the USA, require organizations to audit their ethics periodically and even, as in the Netherlands, to report about it in their annual report.)
- To improve ethics (An ethics audit can provide information about what should be improved.)
- To better manage the ethics of the organization (when the ethics audit provides directions for what should be improved and safeguarded)

- To exclude stakeholders that undermine the ethics of the organization (when the ethics audit of a stakeholder shows that the stakeholder does not or even will not meet the ethical criteria set by the organization)
- To inform stakeholders about the ethics of the organization (so that stakeholders are cognizant of the ethical content of the organization)
- To prevent discussions about the ethical content of the organization based on invalid or incomplete data

### Ethics Audits in Practice

To date, there is limited data available on the use of ethics audits in practice. A KPMG survey among US working population in 2013 showed that 56% of respondents indicate that their organizations audit and monitor their ethics. A KPMG survey among the ethics officers of Global Fortune 200 companies in 2014 showed that 85% of those companies monitor the effectiveness of their code of ethics, and 40% screen the suppliers using the company's own code of ethics.

### Frameworks for an Ethics Audit

An ethics audit requires a framework consisting of the ethical norms to be applied in the evaluation of the object of the audit. The literature provides several frameworks, such as an overview of the possible components of and the criteria for an ethics program as such and for each component specifically. The five-dimensional model developed by Victor and Cullen (1988) can be used for assessing the ethical climate, and Kaptein's (2011) eight-dimensional model for assessing the ethical culture. We can also find in the literature criteria for the ethics of managers, employees, and leaders and for the behavior toward and relations with stakeholders. In this respect, an ethics audit is different from a compliance audit. The latter examines whether the object of the audit meets applicable rules and regulations, while the former can be broader because ethical values, principles,

and norms that are not laid down in rules and regulations may also be used as criteria.

### Methods for an Ethics Audit

The methods used in an ethics audit can be similar to what is used in academic research, e.g., questionnaires, interviews, observations, and desk research. Desk research can include not only the examination of documents and websites, or press coverage of an organization but also the examination of existing data sources, within and outside the organization, such as the number of whistleblowing reports and amount of missing material.

### Ethics Auditors

A professional in the field of ethics auditing conducts an ethics audit. Such a person should be qualified and have sufficient expertise. They can work at an auditing, certification, or assurance firm, for a regulator or other government auditor, or within the organization itself, such as the internal audit department (the third line in an organization) or the ethics office (the second line in an organization).

### Issues for Ethics Audits

Designing an ethics audit involves making decisions regarding various kinds of issues. Apart from the abovementioned issues (e.g., determining what is to be audited, the objectives, framework, and methods of the audit, and who the auditor will be), other issues include the time orientation of the audit (retrospective and/or prospective), position of the audit (separate or integrated with other audits), type of information in the report (quantitative and/or qualitative), type of assertions (negative or positive), and disclosure (internal and/or external reporting).

## Relevance of Ethics Audits for Science

The use of ethics audits by organizations raises several interesting topics for academic research, such as the following:

- As an ethics audit is an instrument to improve the ethics of organizations, it is interesting to find out to what extent organizations use an ethics audit, whether such audits indeed contribute to the improvement of the ethics of organizations, and under what conditions they are effective.
- The frameworks used by organizations in conducting ethics audits can be a source of inspiration and reflection for building scientifically validated frameworks for examining and evaluating the ethics of organizations and their stakeholders.
- The data collected during ethics audits by and for organizations can be used for academic research on the ethics of organizations, such as its developments, antecedents, and differentiators.
- Academic research can contribute to the development of the ethics auditor as a discipline (next to the ethics officer) by developing profiles and curricula for ethics auditors and methods, concepts, and approaches to audit the ethics of organizations.
- An examination of the extent to which ethics auditors in practice use scientific concepts for ethics audits can help in discovering the contribution of business ethics as science to the ethics of business in practice.
- As the value of an ethics audit depends on what is done with the results, the follow-up to ethics audits is an interesting topic, not only for scientific research but also for a follow-up ethics audit.

## Definition

Ethics committees (abbreviated to EC) can be found in different societal settings, such as health care ethics committees and research ethics committees as well as animal ethics committees, professional ethics committees, and bioethics committees. A company may also have an EC. An EC can be defined as a group of people who are appointed to address ethical issues by a company. ECs can be regarded as part of an broader ethics program, which companies use to improve and safeguard their ethics. ECs can be supported by an ethics office (see ► [Corporate](#)

[Ethics Officers](#)), which can serve as a first contact for employees.

## Origins and Presence

The origins of ECs can be traced back to the clinical setting. In the 1920s, the sterilization legislation, which was a result of the eugenic movement, led to the formation of committees to regulate clinical decisions. These sterilization committees, mainly consisting of physicians, made “objective” decisions to avoid social burdens by inherited disabilities.

With the establishment of the abortion selection committees, a similar form of judgement making was created. The abortion selection committees were used in the clinical setting until the 1970s in the United States and mostly identified pregnancy terminations due to medical or psychiatric conditions.

Moreover, ECs can be regarded as a product of the former bioethics movement, which began in the 1960s and the secular bioethical theory since ECs were used to study and make judgements about ethical issues brought about by developments in biology and medicine.

The idea of companies having an EC is relatively new. It won prominence as part of broader ethics reform due to corporate scandals at the start of the century, such as Enron and Tyco.

To date, about 30% of the companies in the UK, 42% of the companies in Australia, 56% of the companies in Canada, and even 75% of the companies in the USA do have an EC (Callaghan et al. 2012; Montagnon 2016).

## Functions

ECs can have one or more different functions. Thirteen different functions are presented here.

As a *radar*, the objective of the EC is to proactively signal ethical issues internal and external to the company. Here the EC signals ethical questions, risks, and dilemmas and puts them

on the agenda for discussion, analysis, and follow-up.

As a *platform*, the EC brings together different individuals and groups to discuss ethical issues. The EC can, for example, organize stakeholder dialogue sessions where stakeholders and the company share their expectations and dilemmas, so that the participants learn from each other (see ► [Autonomy and Informed Consent](#)).

As an *informer*, the EC provides information within or outside the company about, for example, the company’s code of ethics of the company, its ambitions, and its ethical performance.

As a *norm developer*, the EC’s function is to create new ethical norms. Based on new issues, it defines what the desirable position is of the company and whether that implies that the current code of ethics should be changed (see ► [Research Integrity and Research Misconduct](#)). The EC can also suggest a new interpretation of a current norm.

As a *policy developer*, the main function of the EC is to develop new ethics policies. The difference with the norm developer is that the development of policies can be based on current norms, whereas the EC as norm developer is focused on defining new norms (see ► [Research Integrity and Research Misconduct](#)).

When the function of the EC is to be an *advisor*, it gives advice about ethics to employees or management of the company. Employees and managers can then contact the EC to get advice regarding how to deal with dilemmas with which they are confronted (see ► [Ethical Dilemmas](#)). The EC can also provide, requested or unsolicited, advice to the management about how the ethics of the company can be improved.

As an *implementer*, the EC implements the desired ethics into the company. It then coordinates or runs the ethics program by, for example, training people, developing e-learning, and offering tool-kits.

As a *recorder*, the EC registers reports of, for example, alleged unethical behaviour, conflicts

of interest, and ethical dilemmas (see ► [Conflict of Interest in Research](#)).

As an *investigator*, the function of an EC is to conduct research into allegations of unethical behaviour (see ► [Corporate Crime](#)). The EC then conducts the investigation itself or coordinates the investigation to determine whether or not misconduct has occurred.

As an *evaluator*, the EC's function is to review and assess the ethical content of the company and decide to what extent the company is ethical.

As an *approver*, the EC evaluates employees' queries about whether something is permitted or not. Employees may, for example, ask permission about sideline activities, private transactions in shares, and presented gifts. The function of the EC can also be to approve that proposed new products, new methods, and new activities are ethical.

As a *rewarder*, the EC decides who can be rewarded and in what form. For example, the EC can confer an annual award for the best ethical initiative, innovation, or solution by an individual or team.

As an *auditor*, the EC assesses whether the presented information about the ethics of the company is valid (see ► [Ethics Audit](#)). The EC then gathers evidence by conducting research, such as observations, tests, and surveys.

## Features

Depending on their function, ECs have different features. These features are usually described in the charter of an ethics committee. The main features are:

- *Term*: Whether the EC is permanent or ad hoc.
- *Formation*: How members are chosen and their terms of office.
- *Composition*: Whether, for example, the EC has internal and/or external members or management and/or nonmanagement members.
- *Authority*: The extent to which the EC may take binding decisions.

- *Reporting*: Whether the EC has to report about its activities and results.
- *Resources*: The extent to which the EC has a budget.
- *Frequency*: The number of times the EC convenes.
- *Structure*: Where the EC is located in the company structure and to whom it is responsible.
- *Decision-making processes*: What decision-making methods are used during meetings of the EC.
- *Visibility*: The extent to which the EC is visible within and outside the company.

## Effectiveness

To date, no research has been conducted into the effectiveness of ethics committees in companies. Expected conditions for effective ECs, based on research in others contexts, are:

- Commitment of management
- Dedication and quality of its members
- Having sufficient resources

## Ethics Education in the Professions: Those Who Have Taught and What They Have Taught

### Introduction

Every few decades, especially in the wake of a scandal on the part of professionals, clarion calls to teach applied ethics abound. Implicit in these calls are two assumptions: (1) teaching professionals ethics will make them less prone to ethical failure and (2) formal, direct instruction is the one best way to teach applied ethics. These clarion calls overlook how the substantive purpose of applied ethics education is not utilitarian, and there are many ways to teach applied ethics, that is, if professionals are to resolve dilemmas ethically.

Concerning this history, this entry raises two questions: “Who has taught applied ethics?” and “What have they taught?” The responses weave the literature of eight professions concerning applied ethics education into a unified tapestry. This entry closes with two considerations that may assist in altering negative perceptions regarding those who teach applied ethics as well as the discipline itself.

### Who Has Taught Applied Ethics?

The literature offers two images portraying those who have taught applied ethics for the past century.

The first image draws attention to how they have embodied and communicated good character. It portrays them as highly ethical as well as possessing a wealth of knowledge and expertise in applied ethics, pedagogy, and their professions (Richardson and Fenstermacher 2001).

Their good character has provided preservice professionals “a lens through which they are encouraged to examine teaching practices and the values they reflect” (Campbell 2015) which, in turn, has improved the professions and society (Green 2018). Their good character has also conveyed to preservice professionals how the “good” is the animating soul of professional practice (Fisher et al. 2007).

Ethics educators have also assisted students to “know the good” by teaching them how to deliberate about dilemmas at higher levels of cognition (Hardesty 2005). They have further assisted students to “will the good” and “be good” *qua* professionals, irrespective of the perceived risks and rewards (Leclair 2005).

Exemplifying the spirit of professional ethics, this image conveys how ethics educators have formed the minds and informed the hearts of students to conduct themselves ethically – *being* good by *doing* good.

The second image portrays their struggle for legitimacy. Relationships with colleagues are “uneasy,” oftentimes characterized by “discomfort” although “dual citizenship is possible” (McGowan 2005). Working in isolation from colleagues who teach specialized courses, these colleagues view ethics educators with suspicion, considering them “intellectual interlopers” and questioning their value (Rhode 1992). Why? Many – if not most – ethics educators have learned ethics informally; junior professors are oftentimes reluctantly volunteering for or being required to teach ethics (Daly et al. 1995).

### What Have They Taught?

Resolving the dilemmas of professional practice requires professionals to deliberate about what theory *and* skill require by *knowing* the good

(theory), *doing* the good (skills), and *being* good (practice).

Over the past century, ethics educators addressed this fundamental challenge by focusing upon three distinct, yet interrelated curricular matters: balancing theory and practice; formulating the curriculum's contents; and responding to mandated principles, standards, and evolving best practices. The goal was to prepare professionals who would make ethical decisions and demonstrate ethical competence (Cooper and Menzel 2013).

### Balancing Theory and Practice

The primary challenge confronting applied ethics educators for the past century involved balancing theory and practice. Much of this work focused upon determining whether the curriculum should inculcate "low-road" ethics – compliance – or "high-road" ethics – character – in preservice professionals (Rohr 1988).

Especially during the first half of the twentieth century, ethics educators differentiated between declarative knowledge – "knowing-that" – and procedural knowledge – "knowing-how" (Ryle 1949). While concurring that both are necessary for professional practice, ethics educators argued during the century's second half that both are insufficient. They maintained the curriculum should evoke something more: a deeper, more personal, and abiding commitment to aspire to and pattern one's practice according to a profession's virtues (Johnson and Ridley 2008).

Differentiating between "knowing the good" and "being good" yet firmly believing that professionals should also demonstrate purposeful, intentional virtuous conduct (Anscombe 2000), ethics educators more recently have drawn attention to the cognitive, affective, and conative aspects of ethics education. Integrating these into the curriculum, it is believed, will prepare professionals to promote a "chain of consent" through an exercise of "normative" power rather than a "chain of command" through an exercise of "coercive" power (Etzioni 1975).

While ethics education is believed to improve decision-making and mitigate the risk of ethical failures, the ideal curriculum – one featuring an appropriate balance of theory and practice – continues to be contested in the twenty-first century (Todd et al. 2017).

### Formulating the Curriculum's Contents

For the past century, this struggle to identify the appropriate balance of theory and practice has framed the curriculum's general contents: professional codes of ethics and conduct; ethical theory; deliberative decision-making; and applications to practice.

*Professional codes.* While codes provide "necessary" content, the question concerns what is "necessary" (Todd et al. 2017). For some ethics educators, content is primary; for others, application to practice is primary; yet, for others, it's a mix of both (Johnson and Ridley 2008).

Today, this struggle pits compliance against relevance in an attempt to identify the appropriate balance. Studying codes can devolve into ethical minimalism while studying theory can minimize a code's significance for practice.

*Ethical theory.* Across the professions, ethics educators have incorporated ontological and deontological theories into the curriculum (e.g., natural law, utilitarianism, the categorical imperative, subjectivism, and social contract theory). More recently, they have incorporated justice and feminist theory into the curriculum as well as virtue ethics, social justice (e.g., equity, diversity, power, culturally relevant pedagogy, and anti-discrimination), and an array of virtues (e.g., care, empathy, fairness, inclusion, integrity, respect, responsibility, and tolerance).

Today, ethics educators believe the "conditions of modernity" require the curriculum should include the way professionals conduct themselves in nonideal circumstances (Kane 2010). Others believe the culture's pervasive consequentialism must be confronted (Svara 2015).

*Deliberative decision-making.* While professionals should expertly apply their profession's declarative and procedural knowledge, dilemmas

arise in complex contexts. For this reason, the process – making ethical decisions – must also include “knowing why.”

Deliberative decision-making directs attention to a profession’s virtues that should characterize a profession’s members through the formation of “professional conscience” (Green 1999). In this way, decision-making supports the quest to discover the “good” by prodding professionals to conduct themselves to “be good” by “doing good,” comporting themselves in ways that are worthy of “clear recognition with praise for accomplishments” and of “concern or care from others,” redirecting attention away from subjectivism and toward enacting universal values (Kane 2010).

Deliberative decision-making also assists professionals to critique, build upon, and extend their insights into the dilemmas of practice to identify what’s possible, the best option, and how to implement it. In addition, because decisions made foreclose others, applying professional wisdom in practice highlights the significance of ethical leadership, that is, motivating others to recognize and then to emulate demonstrated ethical competence (Cooper and Menzel 2013).

*Applications to practice.* One persistent challenge across the past century concerned how applied ethics educators would make the curriculum’s declarative knowledge relevant, once again raising the issue of curricular balance.

While ethics educators have agreed that introducing case studies enhances relevance, they have disagreed about their use. Some have utilized case studies exclusively, others have introduced cases first, and others have done the opposite. The general consensus holds that balance requires some form of case study pedagogy, for example, Cooper’s (2018) “design model,” which integrates the cognitive, affective, and conative aspect of ethics education with one’s roles and responsibilities in a way that enhances relevance.

### Responding to Mandated Principles and Standards

The early twentieth century featured professional associations promulgating codes of ethics offering members generic principles and standards to

guide practice. Few codes provided enforcement regimes, the general exception being the requirement of some form of ethics education as a precondition for licensure. Relegating how a code’s contents would be conveyed to “experts” in the Academy, the curriculum’s contents represented a consensus among a profession’s members (Watkins 2015).

By the mid-twentieth century, accreditation associations were mandating standards to convey a code’s contents (Misch 2002). Disagreement among professional associations, accrediting associations, and ethics educators concerning “what” should be taught and “how” it should be taught has continued to complicate efforts to standardize the curriculum (Jones 1991).

## Two Considerations

Integrating this history into a unified tapestry depicting applied ethics education during the past century raises two considerations. If implemented across the professions, these considerations may improve applied ethics education and how it is taught. In turn, these improvements may alter negative perceptions about the value of the curriculum and those who teach it.

### Concerning Applied Ethics Education

Applied ethics education has aimed primarily at forming ethical character and has utilized a system of continuous, progressive, and developmental learning activities to prepare professionals to conduct themselves virtuously. However, “ethics education” is a general term subsuming preservice ethics *instruction* and in-service ethics *training* (Fig. 1).

During the past century, preservice ethics instruction generally transpired in a classroom, with the curriculum conveying a profession’s declarative knowledge and emphasizing theory, skills, and their integration for practice. Retrospectively, the focus could have been more intentional: “theory-for-practice.”

In-service ethics training was not pervasive. Today, it needs to be more systematic, transpiring in the workplace, and featuring professionals

learning organizations (Jacobs 2019). This agenda offers the promise of increasing trust in organizations.

## Ethics in Leadership Coaching

Pleuntje van Meer

Synnova BV, The Hague, The Netherlands

### Synonyms

Coaching ethics; Ethics for a coach; Ethics of care; Values-based coaching

### Definition

Coaching ethics, or the role of ethics in a coaching relationship, speaks to relational and organizational morals and competencies for the coach as well as other parties involved. There's both a need for ethical conduct from the coach and for ethical awareness with regard to ongoing contracting. This is open for interpretation, as the work takes place as an exchange between human beings. Defining ethical coaching or distinguishing it from unethical coaching isn't definite yet requires the coach's consciousness as well as moral compassing. In this reflection, we refer to it as the establishment and clarity of the relational space, keeping in mind a triangulation between coach, client, and at times also the employer or the client's organization.

This writing aligns with definitions from professional coach bodies, for example, the International Coach Federation which articulates its ethical philosophy as "a form of coaching that honors the client as the expert in his/her life."<sup>1</sup> The coaching profession asks that a coach isn't a content expert yet facilitates a client's process, allowing the client to discover and take responsibility for their process. It focuses on a future state

or learning aspiration, facilitating clients to bring out their potential, as well as searching with them to overcome hindrances.

### Description

The term coaching originates in sports, where it addresses the process of supporting increased performance. The term is used in organizations as well since the 1970s (Gallwey 1974; Whitmore 1992). There's a common understanding of what coaching is about, yet it isn't a protected term: everyone could declare themselves a coach. Coaching is mostly described as an ongoing professional relationship that helps people: the dialogical facilitation or guiding of a developmental process, which moves a person from place or stage A to B. This change in place or stage, which might shift during the conversations, is defined by the client and takes place in the context of an organization. Organizational coaching is what this paragraph refers to. On organizational coaching, a relational contract with the client who is being coached, as well as with the organization in which the client works, which may pay for the coaching. The topic for a coaching can be widespread, yet its essence lies in unlocking a person's *own* potential and in the coach's role, as "helping them to learn rather than teaching them."<sup>2</sup>

Coaching contracting happens between parties: the coach, the client, and often also the organization in which the client works. A practical guideline here might be the question: who pays for the sessions? If a client seeks coaching outside of the organization's sphere, for example, as the topic is more about life in general, or when there's a conflict of interest, it might happen that there's no connection to the organization at all. Often however there's a three-way contracting around goal, approach, investment, and length of the

<sup>2</sup>Tim Gallwey and John Whitmore, both coming from a background as a sports coach, have each contributed much to define coaching and the role of the coach. They pointed to the coach's recognition that the internal obstacles are often the most daunting ones to allow growth or better performance.

commitment. Ethical guidelines in coaching then refer to each aspect of this triangle, as well as to the way in which the coach operates.

1. Coach conduct, including the coach supervision
2. Coach  $\Leftrightarrow$  client
3. Coach  $\Leftrightarrow$  organization
4. Client  $\Leftrightarrow$  client organization

See Fig. 1 for a schematic overview of this contract.

### Coach Conduct

Firstly, the role model of the coach in a coaching process is important for an ethical coach process. The way in which the coach conducts him or herself, through character and competence, allows or limits a coaching conversation and thus the learning of the client. Ethical virtues and values may be distinguished in this respect. Donna Ladkin helpfully describes the difference between virtues and values as follows:

ethical virtues are ‘rules of personal conduct,’ ethical values are more aligned with values forms of behaviours, such as trustworthiness, reliability, reciprocity and as such are variable from culture to culture. (Ladkin 2010, p. 155)

Ethical conduct asks a coach’s clarity around values and beliefs, to allow a fair representation of skills, qualifications, and experience, as well as a

knowing what type of coaching to offer. As in most people and medical professions, the “do no harm” is a guiding ethical principle and a value set which to the opinion of this writer need to include equality, diversity, respect, and learning. However, as values are personally interpreted, and as the coaching profession today is an open terrain, the way in which this is done is to discretion of the coach. The coach often, some professional bodies request always, seeks its own supervision or a continuous professional learning and exchange. This is usually done on an anonymous basis with regard to names and organizations, yet ethics are that the supervision as such is explicitly named to the client.

### Coach $\Leftrightarrow$ Client

Secondly, in the coach and client relationship, four aspects are important to describe: contracting, confidentiality, conflict of interest, and power differences.

**Contracting:** During the initial meeting, there’s an exploration of the client expectation, to see if there’s a match with the coach’s competence and experience. At the same time, there needs to be a sense of “chemistry.” When this leads to an initial engagement, it’s made explicit in a written or oral contract what the purpose, frequency, and setting are likely going to be.

**Confidentiality:** As part of the engagement, a coach is bound to confidentiality, and the client determines what to share or what not to share, with third parties, including the employer or client organization. The boundary in this is “as far as the law goes,” which may seem far-fetched, yet it isn’t a theoretical boundary. In practice it does happen that people open up about fraud, misconduct, or behaviors that at the present time may cause harm. It may compromise a coach’s promise of confidentiality when finding out about current misconduct, which causes harm to people or their organization. Only rarely a client sharing may cross this boundary, yet when it happens it violates the coach integrity. Thus it is important that confidentiality is explicated at the start of the conversations, to ensure that not only the client intimacy yet also safety boundaries for the coach are taken into account.

**Ethics in Leadership Coaching, Fig. 1** Triangulated relationship between coach, coach-client, and the client’s organization

**Conflict of interest:** When there are multiple parties engaged, for example, when the coach explores a setting through interviews or when multiple people from one organization or context are being coached, conflict of interest may arise. With a potential clash of interest, it's important that the coach addresses this. As part of my coach practice, personally I allow the "first" client, with whom I work the longest, to guide me in taking additional contracts on within their organization. When for them it feels less safe that I'd work with a team or a colleague, I will not do so.

**Power difference:** In coaching, other than in a therapeutic relationship, the coach-client is seen to be healthy and resourceful. The dialogical setting means that there's a shared power base in the relationship, also referred to as power "with" rather than "over" (Fletcher 2001). Practically, the coach-client determines pace and focus of conversations, and the coach takes shared accountability for quality of process.

How does the above play out in practice? Ethical consideration may, for example, be necessary, when a change of behavior is postponed. This may play out when the coaching is used as a postponement to take stronger actions, for example, to take someone out of their role. This could occur when a client or their organization, intent to work on unwanted behaviors, i.e., a leader might be unpolished, may use bullying language and/or overpower subordinates. In such an instance, when coaching is considered an approach, it seems important to not lose sight of what is yes/no acceptable behavior. As a coach this means that the conversation may become a place of confession instead of learning. When that happens, the initial intention to creating a safe space and to turn undesired behavioral effects into a behavioral change may reach the opposite effect. This may happen through offering a continuous externalization through words of the "arcana" of consciousness (Foucault 2010, p. 84).

The coach could then take on the role of more than a trusted conversation partner, a "priest"-type figure, declaring absolution and praising the honesty of the client. What initially may feel as an open and intimate relationship may create dependency and allow undesirable behavior to continue.

One way of addressing those ethical boundaries is the conversation about – the lack of – lasting behavioral changes that occur during the coaching engagement.

Another situation that might occur is that the coach-client is asked to change behavior, while instead they protest to certain organizational norms, as clients speak up against the norm, i.e., when their management or a sector misbehaves. In this case the coach may wish to address that there's a political situation, within which the choicefulness of the client may lead to an outcome, initially undesired by an organization.

### Coach ⇔ Client Organization

At the start and end of a coaching process, many organizational coaches ask for a three-way conversation.<sup>3</sup> This allows the employer and coach-client both in the conversation at the same time.

The ethical aspect of a three-way conversation is that there's complete transparency to both the coach-client and their organization around the communication. Communication about the coaching may feel vulnerable, which is where ethical clarity helps, as well to the coach, as well as from coach. This allows the coach-client to lead when it comes to the level of disclosure and the employer to bring their observations and expectations into the coaching overtly. Ethics ask of the coach to create this sense of openness and transparency by clarifying those boundaries of the conversation.

At times the coach-client organization contract goes beyond the above scope, for example, when there's multiple conversations without a coach-client being present. As a ground rule, this only happens after explicit request of the coach-client, for example, when being curious for more detailed feedback on one's leadership behavior.

<sup>3</sup> According to research commissioned by The Learning Curve, which was carried out by Adsum, UK, 2014, around half of the organizational coaching starts with a three-way conversation and around 33% ends with a three-way conversation.

### Client ⇔ Client Organization

There are aspects to the relationship between a client and their organization, which can be of major influence to the quality of a coaching engagement, yet that might initially not be overtly part of the conversation, for example, when there's a conflict of interest around the employment or different opinions around one being "fit for the job." At times I've also come across an information request, as there might be assessments taken as part of the coaching, in which an employer shows an interest. Ethics asks of the coach a similar transparency here, as mentioned under (3) in that no information is given to an organization about the coach-client without them knowing so. At the same time, a coaching engagement isn't fit to assess *for* parties yet meant for the client's growth and development or to make up their mind. A boundary for the coach in situations when there is a conflict of interest is to share opinions with parties without clearly being requested by the coach-*client* to do so.

### Summary

As a growing and maturing profession, coaching needs to be carried out with recognition for generic ethical principles that make the relational interaction between coach and client as valuable as can be. Through asking explicit attention for those ethics, the encyclopedia supports the continuous dialogue around this.

## Ethics in the Media

Kemi Ogunyemi

Lagos Business School, Pan-Atlantic University,  
Lagos, Nigeria

### Synonyms

Communication ethics; Media ethics

### Introduction

The media, a means of communication with large audiences, have evolved over the decades from more traditional forms – such as radio, newspapers, magazines, books, and video games – to new media using the Internet, such as blogs, websites, podcasts, and social media apps, as well as digitized formats of all the traditional media. The first nonprint form of mass media was the radio, followed by the advent of the television after World War II. Television revolutionized global communication at that time, and now the Internet has gone further to make the world feel as interconnected as a village. According to Jones (1980), the press was originally a way for individuals to express themselves, comment on issues, and criticize social ills. It was also a way to communicate and spread new ideas. The media's role in society has since been extended – it now aims to not only educate and inform but also entertain, serve as a public forum for discussions, and act as a watchdog for society in order to uphold truth, justice, and the common good.

The concern for ethics in the media grew due to the increased awareness of the need to protect

public interest (Jones 1980). Since mass media profoundly influences cultural perceptions and attitudes, it is important for the creators and distributors of media content to act responsibly. In the past, ethical issues flagged include stereotyping, racial underrepresentation, and sexually explicit content. In the competitive and rapidly changing world of mass media communications, media professionals concerned about deadlines, profit imperatives, and political and corporate interests can easily lose sight of the ethical considerations that should guide their work (Jones 1980). Perhaps because of this, codes of ethics developed by the industry in different countries vary in scope and content. Apart from codes and government regulation, media professionals are expected to have high ethical standards because of the powerful reach of their work.

Areas in which media ethics could be practiced include organizational and business communication, marketing and advertising, community relations, and journalism. There are also a variety of new media platforms which defy traditional classifications but belong to the media industry since they are channels of communication to the public. In all these spheres, people who handle communication should do this in responsible and respectful ways, avoiding distortion, misrepresentation, manipulation, slander, detraction, and a host of other harmful acts.

This brief introduction is followed by a discussion of ethics in the media and then by two sections on ethics for media professionals (covering all who pass information through the media). Other headings include common ethical issues in the industry, ethical sensitivity, an excerpt from a code of ethics, ethical listening, integrity training, and the benefits of media ethics.

## Ethics in the Media

The scope of ethics in the media spans all aspects of human communication. One approach to discussing media ethics could therefore be by reflecting on who is communicating to whom, what is being communicated, and how, where, and when the communication is effected. These

questions can provide an initial context for introducing the ethical issues that challenge media professionals. They are presented below as different lenses through which one can assess ethics in the media.

### Who Is Communicating?

Sources of communication (between individuals, groups, or corporate entities) via various media include both formal media practitioners and non-professionals who have something to say to the public. (Nowadays, anyone can be a media professional or practitioner since the Internet allows people to use new media to reach the public easily and effectively without any need for a formal training. Hence, in this entry, the term media professional includes everyone who reaches out to the public via any medium – blogs; advertising; social media apps and portals; websites; podcasts; radio; music, dance, theater, and film; television and cable; newspapers (print and electronic formats); etc.) In both cases, the media sources have an informational advantage over those they serve, and such asymmetry can be exploited by media experts. The power held by media practitioners needs to be wielded responsibly for a number of reasons. Many people around the world base their judgments and decisions on and make choices swayed by whatever they perceive to be public opinion. Hence, people who use the media to communicate have a special responsibility. When they are certified professionals, the responsibility is heightened by the popular perception of the media as the voice of the people, the voice of truth, and the power to drive justice for communities, for example, in questions of human rights, ecology, politics, etc.

### What Is Being Communicated?

In this regard, information could be true or false. The media professional needs to be known for truth, honesty, accuracy, and objectivity; these assure the quality of information received by the public. Focusing on journalism, Elliott (2008) advocates three essential values shared by media professionals, which cut across culture, time, and paradigm shifts: (a) balance, accuracy, relevance, and completeness (BARC); (b) avoidance of

causing preventable harm; and (c) providing information that citizens need for self-governance.

### **To Whom, How, and When Is Information Communicated?**

Minors have to be protected from harmful information. There are also communications that are harmful to all persons regardless of their age. Besides, the means used to get the information matter. When inappropriate means are used, it is likely that people are being harmed in the process as, for example, when privacy or confidentiality is breached in order to sell a story. Media professionals must also balance accuracy and fairness in transmitting information to the public. In addition, they need to be careful and avoid releasing certain news at bad moments that could cause strong reactions or precipitate war, for example.

### **Ethics for Media Professionals: A General Principle**

One general principle that is very easy to grasp and apply is the one known as the “Golden Rule,” which is contained in different phrasings in different religions and belief systems. The golden rule asks one not to do to others what one would not like to do to oneself. “Then there will be no resentment against you, either in the family or in the state” (Confucius, *Analects* 12:2). Even if some information can benefit someone, one needs to consider how to provide it without harming anyone else. Thus, for example, perhaps announcing the next-door café’s secret ingredients for their best-selling apple crumble on the 9.00 pm news or on social media might be beneficial to customers who could then make it at home, but it would probably harm the café’s owners and employees by undermining the need for their business. Perhaps it would be better, while refraining from using the information in order not to harm the café, to also refrain from revealing which of the employees inadvertently caused the well-guarded recipe to reach the media. Similarly, it is wrong to use people as means to other people’s ends.

### **Ethics for Media Professionals: Truth, Human Dignity, Common Good, and Respect**

If one could recommend four cardinal points for media professionals to observe, they could be the following:

- (a) Seek and uphold truth.
- (b) Protect and promote human dignity and flourishing.
- (c) Seek and protect the common good.
- (d) Respect differences.

Knowing the truth helps people make good choices. Hence, people who disseminate information in the media can contribute a lot to helping people live good lives if they disseminate truth. According to Elliott (2008), journalists were traditionally required to seek external discoverable truth or, if there is no clear single truth, present at least two different sides of a story; use sources with recognized expertise or authority; and present objectively the information they obtain. The same author points out that new dimensions include more direct reporting of general issues and events, additional use of open sourcing to get information rather than one’s own abilities, targeting of specific audiences, and possibilities of quickly incorporating audience feedback into the news. However, at times, the fact that something that several people think is true may not actually be true is forgotten or disregarded.

### **Common Ethical Issues in the World of Media**

Some common ethical issues in media practice include unrealistic profit expectations encouraging unethical behavior, e.g., selling news and achieving popularity by engaging in sensationalistic practices that exaggerate or distort the truth; manipulation/distortion of facts in the course of information collection, preparation, analysis, and reporting; and misuse of media power to drive public opinion.

### **Falsehood in the Form of Misrepresentation, Lies, and Deception**

In this category, we could include the retouching of photos and fake photos or inaccuracies in reporting. Consumers who are deceived into taking these as truth may end up forming opinions and/or making decisions that are harmful.

### **Sensationalism**

Some media people thrive on spreading sensational news for the sake of profitability and go out of their way to intrude on people's privacy or invent stories just to keep selling news. Also for the sake of profit, some media people capitalize on selling sex and violence, disregarding the negative impact of repeated exposure of media consumers to these themes. In these cases, media practitioners prey on people's vulnerabilities, for example, curiosity, peer pressure, insecurities, and addictions.

### **Intrusion on, and Lack of Respect for, Privacy**

Respect for people's dignity and rights can sometimes fall by the wayside in the rush to get and publish information. Both celebrities and ordinary people suffer from media disrespect in this regard. Again, confidentiality of sources may be compromised because of pressure at work or for financial gain.

### **Commercialism**

When media is undertaken for private financial gain rather than in the interests of truth and justice, its practices are easily perverted. There is nothing wrong in being keen to make profit. However, the media industry holds great power and influence – and as such it also has great responsibilities.

Other issues related to the media are intellectual property rights; copyright, trademark, and patent infringements; plagiarism and piracy; corporate espionage; cybersquatting; and so on.

### **Ethical Sensitivity and the Morality of Human Acts: Rules About Harmful Side Effects**

The media professional needs to be aware of the possible ethics pitfalls he or she may face, and this

involves ethical sensitivity, which refers to the ability to recognize problems when they occur and appreciate the full significance of ethically challenging situations. Knowledge or development of formal guidelines for producing media content ethically, for example, professional ethics codes, could also help to facilitate this process. A media professional could also use a personal mission statement declaring how he or she will work.

Normally, an act that has a harmful side effect can be allowed only if:

1. The act to be performed by the media professional is in itself good or at least neutral. He or she should not be doing something harmful.
2. The purpose of the act is good.
3. There are no reasonable alternatives to the act. This implies some reflection on possible alternatives once the harmful effect is foreseen.
4. The harmful effect is not wanted or sought at all by the media professional.
5. The harmful effect is not a means to the good effect desired by the media professional.
6. There is a proportional cause to allow the harmful effect. Harmful effects cannot be allowed for the achievement of a relatively less important good.
7. All possible steps are taken to effectively mitigate the harmful effect (Ogunyemi 2014).

The absence of any of these seven requirements means that act is not allowable in spite of the good that it could do.

### **Codes of Ethics**

The Code of Ethics for Nigerian Journalists (Nigerian Press Council 1998, p1) is an example of professional guidance. It includes the following points:

1. "The public has a right to know. Factual, accurate balance and fair reporting is the ultimate objective of good journalism and the basis of earning public trust and confidence.
2. A journalist should refrain from publishing inaccurate and misleading information.

Where such information has been inadvertently published, prompt correction should be made. A journalist must hold the right of reply as a cardinal rule of practice.

3. In the course of his or her duties a journalist should strive to separate facts from conjecture and comment.
4. As a general rule, a journalist should respect the privacy of individuals and their families unless doing so affects the public interest.”

Codes of ethics in the media will continue to evolve as technology changes. They will be adapted and modified to meet different conditions in various countries, but the fundamental principles and values should be common to all.

## The Ethics of Listening

As ethics deals with the application of moral principles to human conduct, it also applies to listening as a human behavior. Listening ordinarily means attending to sound using the ears. It can be extended, in the context of this discussion to reading as well, since a lot of communication takes place soundlessly via chats and other forms of online discussion. Ethical listening would therefore mean the ability to give attention to received information in appropriate ways, with the purpose of hearing or reading accurately what the other is communicating.

If one is not hearing-impaired, hearing (perceiving sounds or words) happens almost unconsciously and involuntarily. On the other hand, listening is consciously done, being a human act and a choice. It is both a skill and an art, and effort and concentration are required to do it well. Listening is a way to know the truth and to avoid misunderstanding others. Unfortunately, we often hear more than we listen. People in media have an extra obligation to listen ethically so as not to mislead the public when passing on the information they have derived from listening.

To engage in ethical listening, the golden rule helps: Listen to others the way you would want to have them listen to you. Suggested practices include:

- Being physically engaged when in face-to-face conversation, e.g., making eye contact, taking notes if needed, smiling, or nodding, to encourage easy and honest communication.
- Being mentally engaged, e.g., keeping an open mind.
- Controlling facial and other expressions that may distract or discourage.
- Listening beyond the words, e.g., attention to body language and tone in order to perceive feelings and other nonverbal communication.

Typical impediments to overcome include:

- Preoccupation, i.e., inability to put aside distracting thoughts while listening.
- Prejudice, i.e., negative feelings toward the speaker or the topic.
- Self-centeredness, i.e., concern for self that can interfere with a decision to listen carefully.
- Stereotyping, i.e., pre-established judgements and ideologies that may impede listening.

Ethical listening has many benefits. For example, it is more respectful, reduces the likelihood of error and of causing harm to others, increases accuracy and therefore credibility, enhances relationships, minimizes or resolves conflicts, and facilitates teamwork. Its importance cannot be overemphasized in the media industry. Truth is often elusive, and the risks of misunderstanding are high even for a person struggling to live an ethical life. Ethical listening helps to reduce the possibility that others may suffer because of a media person's carelessness.

## Integrity Training: Possible Pitfalls, Fake News

In collecting information, media professionals should avoid asking biased questions, drawing generalized conclusions from the information they get from biased sources, selecting information sources that are biased toward the results they desire, passing ambiguous information to the information source, intruding into privacy, and disrespecting confidentiality.

When preparing or processing information before publishing it, the media professional needs to ensure that the selection of what to publish is not biased so as to reinforce a preconceived opinion, that no information is unjustifiably suppressed, and that attention and acknowledgment is given to missing information.

Presenting information in a deceptive manner is also unethical. An example of this is provided by Gerpott and Voelpel (2016, p115): “. . . a study with 19,000 participants found that individuals who met each other at an online dating portal are more satisfied with their marriage than those who met off-line ( $p < 0.001$ ). These findings sound interesting – yet, an examination of the data reveals that, from a practical point, the difference is much less remarkable (satisfaction values of respectively 5.64 versus 5.48).”

Falsifying images or other information is also unacceptable, whether the facts are altered, presented partially, or invented deliberately in order to mislead the media consumer. At times, it is important to inform the consumer about the method used to get the media content, as this may affect its credibility. In another example provided by Gerpott and Voelpel (2016, p116), a published piece of news mentions that “Germany has more than 3.5 times as many teachers as the Netherlands (830,140 versus 217,839). . . . If one were to know that Germany also has almost 5 times more inhabitants than the Netherlands (80.2 million versus 16.9 million), it becomes apparent that the Netherlands actually has a better teacher: inhabitant ratio. Further, more information would be useful to evaluate the meaning of the teacher numbers: e.g., the countries’ birth rate. . . – the facts provided are mostly correct, but they do not . . . show the complete picture.” People who believed this story may easily have drawn erroneous conclusions about the state of education in the Netherlands in comparison with Germany.

## Benefits of Ethics in the Media

The practice of ethics in the media has many benefits. Firstly, the person consistently striving

to practice ethics becomes a better person for it and grows in maturity, integrity, and excellence as a human being, thus leading to fulfilling life. This may also assist in developing a flourishing career. Secondly, society gets better informed, and the media serves as an upholder of truth and justice for everyone. The needs of vulnerable people and minorities may be better satisfied. In addition, the media can encourage good citizenship and educate young people in virtue.

Through ethical advertising, fairness is promoted in the marketplace, and competition is encouraged in a way that favors both producers and consumers. People become aware of the options they have and the benefits of each option so that they can freely decide on which products and services to choose.

Ethical media can also facilitate conflict resolution. The way a reporter approaches issues can be conciliatory rather than unnecessarily inflammatory. The word “unnecessarily” is used deliberately because, at times, media professionals may have the duty to bring up thorny issues and provoke reactions. However, in other situations, the media could act as an impartial mediator, for example, where there could be religious or ethnic tensions. Through the media, people can exchange opposing views in topical matters open to debate such that, over time, they get to appreciate one another’s perspectives and, while they may not change their positions completely, get deeper insights into the issues and a heightened understanding of the way other people see things.

Apart from the individual and more general benefits mentioned above, if a media company practices ethics, they also gain a good reputation as well as client and staff loyalty, and this could be a competitive advantage for them.

On a final note, media practitioners must keep in mind that not all media ethics is covered by legal provisions. This does not mean that the unethical “gray areas” are therefore acceptable. At times, guidance could be found in the many jurisdictions that do have laws that cover most aspects of media work. Developed countries have comparably stricter guidelines on how to gather information, e.g., privacy regulations, rights of people participating in a study (they

must know the purpose, they must be treated properly, etc.), research involving minors, libel and slander, and so on. In contrast, the ethics requirements in developing countries are often much less strict, to the detriment of the participants/subjects/consumers. However, more vulnerability means more responsibility – therefore the duty of care of the media professional is higher where there is less formal regulation.

## Conclusion

The media has a special place in society due to its great influence on thought and action over time and space. This is why media professionals have a heavy responsibility (of doing their job ethically) to the rest of society as they deal with information that influences private decisions (social, economic, political, military, etc.) and public morality. They need to provide information that is relevant to all spheres of life, and they should ensure that they deliver reliable news, logical analyses, trustable projections, and honest entertainment for others to consume. It is one of the professions in which there is an expectation that truth will override profit. Indeed, the media has a role to play in the promotion of peace and harmony in human communities.

## Ethics in Workplace Mental Health

## Introduction

In the new millennium, workplace mental health has become increasingly important among business leaders and scholars alike. A number of factors have contributed to this trend. These include the enormous costs associated with mental health-related absenteeism, presenteeism, or other productivity losses; as well as a rapidly evolving legal environment, which in many jurisdictions places increased responsibility on employers to prevent and demonstrate responsiveness to mental health-related concerns. Moreover, the emergence of the COVID pandemic substantially affected both the employment and personal lives of working age persons, and concerns about a mental health-related echo-pandemic among the working public have also arisen.

In organizational settings, these factors have been associated with the development, implementation, and evaluation of a host of workplace mental health promotion and literacy programs. Such programs provide managers and fellow co-workers with the skills needed to recognize

and support employees who might be suffering from mental health conditions, and facilitate mental health resource utilization (e.g., Dimoff and Kelloway 2019). Similarly, a plethora of workplace initiatives designed to strengthen employee coping and stress management also exist (Foster 2018).

Despite these trends, the topic of ethics in workplace mental health has received relatively limited attention. However, three areas are salient. These include ethics-related factors that have been associated with employee mental health; specific ethical considerations for managers in relation to employee mental health conditions; and, potential ethical concerns about the nature and uses of workplace mental health initiatives. Consider each of these three areas in turn.

### **Ethics-Related Factors Associated with Employee Mental Health**

Though not necessarily framed in ethical terms, research examining associations between certain organizational factors and employee mental health implicitly reflects potential ethical issues relative to how employees are treated. For example, such research has identified the importance of occupational health and safety, work-life balance, and employee involvement, recognition, and opportunities for growth and development in this regard (Grawitch et al. 2015). Moreover, positive leadership and the enactment of certain values such as care for the welfare of employees; responsiveness to employee needs; and the respectful and fair treatment of employees have been associated with employee mental health (Kelloway and Day 2005; Kelloway et al. 2013).

Indeed, justice helps to ensure the fulfillment not only of the instrumental needs of employees but also employee needs for affirmation of identity and self-concept; for moral (i.e., respectful and dignifying) treatment; and for belonging and positive regard. Hence, unethical treatment in the form of injustice has been associated with a broad array of mental health-related issues among employees (Robbins et al. 2012). Additionally, the development of a shared understanding of

what might otherwise be differing perceptions between managers and employees about the reciprocal obligations in the work relationship is important. The perceived (i.e., psychological) contracts held by employees and employers span various areas, including not only transactional dimensions related to issues such as compensation but also relational and ethical dimensions. Violations of these dimensions are also often associated with experiences of mental distress in employees (Robbins et al. 2012; Rupp 2011).

### **Ethical Considerations for Managers with Respect to Employee Mental Health Conditions**

Managers often interact with employees about actual or potential mental health conditions including those that are work-related, as well as those that are not work-related. Specific ethical considerations pertaining to these interactions should be interpreted within the context of jurisdictional legal requirements; organizational policies or values statements; and relevant professional codes and standards for ethical conduct, such as those to which HR professionals might subscribe or be required to adhere by their governing bodies. Situations might arise in which there are seeming differences among requirements made in law, organizational policies, and ethical codes. In such circumstances, it is important to creatively problem solve in ways that can effectively integrate diverse requirements in a respectful and dignifying way. Moreover, managers should aspire to conduct reflective of positive ethical values, rather than that which simply meets minimal legal requirements. Consider the interrelated areas of legal requirements, organizational policies, and ethical codes.

### **Legal Considerations**

In terms of legal considerations, these will vary from jurisdiction to jurisdiction. In the global north, these are likely to emerge from various areas, such as employment, labor, and occupational health and safety laws; common law; and human rights codes, including decisions emerging

from human rights tribunals. Legal findings across these areas might well speak to requirements to prevent mental health related injury to employees; to protect both the confidentiality and privacy of employees (including any requirements to abstain from inquiring about specific mental health diagnoses); and to demonstrate non-discriminatory, good faith actions aimed at accommodating workplace needs that arise from mental health conditions. Moreover, legal requirements within some jurisdictions have evolved to include the duty of employers to inquire about potential ways to support employees if there are signs suggestive of a mental health condition that might be affecting performance (Shain 2010).

### **Organizational Policy and Values Statements**

Organizational policies might exist in various areas that can influence employee mental health. These might include policies related to harassment, incivility, and the like, which can have significant, negative impacts on employee mental health (Robbins et al. 2012). These might also include policies aimed at ensuring fairness in employment functions such as hiring, compensation, and promotion, which can also affect mental health. Moreover, specific policies might well articulate procedural requirements in support of physical and mental health-related workplace accommodations, disability leave, or return to work. Such policies should be reflective of and responsive to evolving legal requirements and ethical standards.

### **Professional Codes of Ethics or Codes of Professional Conduct**

Codes of professional or ethical conduct are typically pragmatic. Rather than focusing on the normative, philosophical roots of various standards, such codes tend to prescribe values and principles to which members should adhere. Codes of professional or ethical conduct that exist within given professions such as HRM might arise from voluntary associations that function to promote and serve the profession, such as the international Society for Human Resource Management (SHRM) for which membership is voluntary. For

example, the SHRM (2014) Code of Ethics for members articulates core principles, intents, and guidelines within six key areas. These include professional responsibilities; professional development; ethical leadership; fairness and justice; conflicts of interest; and uses of information. Key guidelines relevant to employee mental health include those associated with continuous learning and professional development in relation to emerging HR areas, which might include employee mental health; respect for the intrinsic worth of individuals; confidentiality; and, the use of dignity, respect, compassion, inclusion, and fairness.

Alternately, codes of conduct might also arise from within professional bodies that are legally mandated to regulate their profession in order to protect the interests of the public. Regulatory bodies set out requirements for professional certification and practice within particular professional fields and geographical regions. They also articulate codes of ethics and standards for professional conduct to which certified members must comply. Failures to comply with such codes can result in disciplinary action by regulatory bodies against their members. For example, those who are certified as Human Resources Professionals within given jurisdictions are often formally regulated and therefore required to comply with Codes of Ethics and Professional Conduct specified by their regulatory bodies. Such Codes specify principles in a number of areas. Judicious consideration of these ethical duties in relation to employee mental health provides valuable ethical guidance for practitioners. Key areas for consideration might well include ensuring competence to practice HRM; respecting and supporting the dignity, rights, safety, and well-being of individuals; maintaining confidentiality; and enacting exceptions to confidentiality related to disclosures of imminent risks of harm. The latter of these might occur, for example, if employees disclosed plans to harm themselves or others and the HR professional needed to disclose this information in order to prevent enactment of those harms.

Additional ethical considerations that might or might not be articulated in professional or ethical

codes of conduct include those associated with maintaining professional boundaries when working with employees for whom mental health conditions might arise. Appropriate professional boundaries include the ability to recognize the limits of one's professional knowledge, skills, and roles. Specifically, managers are not qualified nor competent to try to diagnose, provide counsel on, nor treat mental health conditions and attempting these things would also likely violate laws in many jurisdictions. However, managers can effectively offer employees information about professional resources available through Employee Assistance Plans or other services. Additionally, though managers might demonstrate compassion in their interactions with employees, it is important to avoid placing themselves into a dual role vis-à-vis employees, wherein they are serving as both manager and personal support person for non-work related needs or crises.

### Ethical Questions About the Nature and Use of Workplace Mental Health Programs

The use of various training or development programs aimed at enhancing coping, time or stress management or resilience among employees might well have benefits for employees. At the same time, concerns have emerged that such training programs might obscure, and hold employees rather than organizations accountable for, the root causes of difficulties that employees might be experiencing in terms of their ability to cope, manage stress, or demonstrate resilience (Foster 2018). This could occur in circumstances in which there are underlying, unrealistic or unsustainable requirements for productivity. Consequently, managers are advised to assess and be responsive to contextual workplace or sociopolitical factors that could influence employee mental health, rather than assume that intra-individual explanations or interventions are necessary and sufficient. Managers should also be cautious about setting requirements for constant and excessive positivity among employees, as this would be inconsistent

with normal variations and daily challenges that exist for human beings (Day et al. 2017).

## Ethics of a Pandemic Basic Income

### Introduction

The COVID-19 pandemic is widely considered to be the largest global crisis event since World War II, measured in terms of social, political, and economic impact on individuals, social sectors (e.g., education), and countries around the world. COVID-19 also represents a unique event in recent human history in that many governments introduced stringent lockdown measures, temporarily grounding much of their economy to a halt in a desperate attempt to curtail the spread of the virus. While controversial, governments' main justification at the height of the pandemic was that, in the absence of effective vaccines, skyrocketing morbidity and mortality rates mandated a radical intervention.

Where possible governments accompanied radical lockdown policies with a series of measures aimed at (partially) compensating those affected by the loss of employment, business, and income. In some cases, governments also tried to compensate for the increased health risk incurred by so-called essential workers as well as care workers (mainly women) having to deal with expanded responsibilities while schools are closed. Pandemic compensation policies took a variety of forms, including extending or expanding existing social support schemes while elsewhere brand-new policies were introduced, albeit temporarily. The different policies adopted

by governments across the globe predictably vary extensively in terms of level of generosity, coverage, duration, and the conditions attached to receipt of pandemic income support.

Many of these schemes had an important impact in mitigating the worst economic fallout of the pandemic, but most were nevertheless criticized for being too restrictive, too stingy, or rolled out too slow and sluggish. Those critical of the targeted patchwork approach to pandemic support instead advocated for a radically different approach to income support that embraces universality and unconditionality. Specifically, they argued for a temporary variant of the so-called basic income proposal: the emergency basic income (EBI) (De Wispelaere and Morales 2021; Ståhl and MacEachen 2021; George et al. 2022). Recent policy scholarship remains divided on the question if the pandemic has really opened a window of opportunity for introducing basic income (Nettle et al. 2021; Weisstanner 2022), but this contribution suggests that the pandemic provides a novel context in which to argue for this type of proposal.

### What Is an Emergency Basic Income?

EBI is a form of temporary cash transfer paid out during the pandemic, with the specific objective of mitigating for the economic fallout of lockdown and other restrictions that negatively impact on individual's income. EBI shares many characteristics with the universal basic income (UBI) proposal that has recently been trialed in several countries, including most famously Finland (Kangas et al. 2021). It is an *individual* payment that does not depend on or track one's household situation. It is an *unconditional* payment that does not enquire into recipients' pre-pandemic circumstances, does not impose conditions on the use of the grant, or insist on reciprocal obligations in return for receiving the basic income. While an EBI may be conceived as a fully *universal* payment, it can also be designed to target only the lower end of the income distribution – perhaps by excluding the wealthiest through an affluence test.

However, whereas UBI offers lifelong regular income support an EBI by contrast is designed to be *temporary* and explicitly linked to the pandemic emergency. The precise duration of an EBI obviously varies with the extent of the pandemic emergency itself, but it also depends on how strict we interpret when a pandemic emergency has ended. There exist three broad types of EBI: a *minimal variant* that only covers the period of government-mandated lockdown; a *maximal variant* that remains in place for as long as the economy is still recovering from the pandemic lockdown, which could conceivably take several years and may even require a staggered phasing out; and an *intermediate variant* which falls somewhere in between, perhaps adding an extra year to the end of the lockdown period.

### Arguing for Basic Income as a Pandemic Policy Response

Pre-COVID-19, the ethical justification for basic income typically revolved around the role UBI plays in promoting economic equality and real freedom for all (Van Parijs and Vanderborght 2017), human development (Haagh 2019), or the implementation of social rights (De Wispelaere and Morales 2016). These justifications have proven to be controversial philosophically and politically, with opponents challenging the excessive cost as well as the lack of reciprocity of a scheme that appears to offer free money for all.

The ethical justification for an EBI however takes place against a very different context, one in which a global public health disaster produces a large-scale social and economic emergency. This changes several of the core factual and moral presumptions surrounding the case for a basic income. For instance, in the context of a government-mandated lockdown the reciprocity principle does not translate into a moral objection to receiving income without work but rather the opposite. There is a strong public interest in incentivizing people to refrain from engaging in economic activity that may involve a serious risk of spreading the virus. At the same time, such a

requirement grounds a strong obligation for society to make it possible for individuals to abide by their social duty through the provision of income support.

A robust ethical case for a EBI can draw on a set of well-established moral principles (De Wispelaere and Morales 2021). The *urgency principle* states that a pandemic policy intervention must respond to the rapidly emerging and changing circumstances in an immediate and agile manner. The *priority principle* maintains that a pandemic policy intervention must give priority to the well-being and prospects of the members that are most vulnerable to the adverse effects of the pandemic. The *solidarity principle* argues that a pandemic policy intervention must support and promote the shared responsibility and agency of preventing or remedying the adverse impact of the pandemic.

Each of these principles can be justified on substantive-moral grounds as well as on instrumental-prudential grounds in a pandemic context. The urgency principle offers strong moral considerations in favor of immediate and fast policy responses grounded in the amount of unnecessary suffering that comes with fractured, sluggish, or delayed responses. This unnecessary suffering is also cumulative and over time may give rise to structural disadvantages that are more difficult or costly to remedy or redress. The urgency principle has a strong prudential dimension since the excessive social costs of accommodating, remedying, or redressing disadvantages incurred because of policy delays are sizeable.

EBI can meet the urgency principle in large part because it avoids the many bureaucratic hurdles associated with targeted, conditional policy responses. Targeted policy responses require individuals to go through an application process and prove their eligibility, while saddling already overburdened (especially in a pandemic context) bureaucrats with the task of cross-checking the application and monitoring the continued eligibility of each case. This inevitably creates delay and risk of error. By contrast a universal and unconditional response such as the EBI can bypass this hurdle and be rolled out much faster. Even an EBI

combined with affluence testing to exclude high earners is comparatively fast and agile to implement. Both the easy implementation and the lack of error (which avoids spending additional time and effort) mean EBI satisfies the urgency principle.

EBI can also be justified with reference to the priority principle, which mandates that pandemic policy responses must give priority to the most vulnerable in society. Pandemic policy becomes a matter of justice once we consider the vastly unequal impact of lockdowns. The detrimental effect on both well-being and opportunities of lockdown policies is never equally shared across the population and is likely to disproportionately affect groups and individuals who already find themselves in a position of vulnerability as well as those being saddled with additional burdens, such as the care work routinely carried out by women. The priority principle is prudentially justified in that failing to adequately compensate those most at risk of poverty or destitution for their lockdown effort will not ensure the full compliance with pandemic restrictions required to combat the virus.

EBI meets the priority principle because it will benefit mostly those who find themselves already in a vulnerable position. This may seem counter-intuitive since EBI eschews targeting in favor of a universal approach. But it is important to understand that universalism allows for implicit targeting whenever a benefit provided equally to all offers more value to those relatively disadvantaged. EBI may not offer much by way of compensation to those well-off, but for someone living at or even below the poverty line this compensation provides a genuine lifeline during a pandemic lockdown. Furthermore, because EBI avoids the delays and gaps in coverage ever-present in targeted policies it again offers an invaluable benefit to the economically vulnerable.

Finally, EBI is strongly supported by the solidarity principle, which expresses the sense that the pandemic context affects everyone in society. The solidarity principle is widely discussed in public health and related contexts and in recent years has emerged as a strong contender for grounding social obligations alongside considerations of

justice (Dawson and Jennings 2012). The COVID-19 pandemic reinforces a sense of social solidarity – we are all in it together – in part because the risk of infection is perceived to be shared by every single individual in society, which in turn promotes a sense of empathy often missing from social problems or disasters affecting specific groups or a subset of the population. The solidarity principle also requires a distinctive collective response since public health interventions such as lockdown measures require that all citizens accept the restrictions to promote a common good. A pandemic policy response must prudentially reinforce this sense of solidarity and togetherness or risk the fracturing of people's acceptance and compliance.

EBI satisfies the solidarity principle in two ways. The first, more superficial way is that EBI expresses solidarity by offering a payment to all as compensation for a policy that affects every single person – a pandemic lockdown aimed at curbing a virus that affects everyone in society. However, a more substantial sense of solidarity is expressed because EBI tries to share the burdens of the lockdown in a more fair and equitable manner. It is established that the pandemic lockdown disproportionately impacts on those more economically disadvantaged but also that EBI is of most value to the disadvantaged and vulnerable in society. Consider now how to fund the EBI. One proposal is to institute a pandemic solidarity levy, paid by those who are least affected by or recover fastest from the pandemic restrictions (De Wispelaere and Morales 2021). This proposal again reflects the differential economic impact of both the pandemic itself and the restrictions imposed on curbing the COVID-19 virus. An EBI financed through a pandemic solidarity levy (or similar redistributive proposal) affirms the solidarity principle because the pandemic burden and the associated economic and social impact are shared more equally across the whole population. Those who are in a better economic position contribute more to the financing of an EBI. This in turn allows those for whom EBI is an economic lifeline to contribute by complying with the pandemic restrictions, which means each in their own way

contributes to the common good of curbing COVID-19.

### From Emergency Back to Universal Basic Income

A robust pandemic justification for EBI can draw on the ethical foundations of urgency, priority, and solidarity. But the pandemic case for EBI is severely limited by the fact that it is by design a temporary measure. As such EBI may play a key role as a *pandemic intervention* in addressing the current suffering incurred during pandemic restrictions, but it fails to address two other key aspects of pandemic policy responses.

In the first place, EBI only has a weak impact on *pandemic recovery*, which concerns the long-term impact of lockdowns and other pandemic restrictions. Pandemic recovery is a salient moral feature because the road toward full recovery once COVID-19 has fully subsided varies considerably in both length and extent of suffering depending on socioeconomic position. This means pandemic recovery has a clear justice dimension and the implementation of a short-term EBI may simply not be sufficient to adequately address the harms incurred by the most disadvantaged and vulnerable in society.

In addition, EBI also only has a weak impact on *pandemic preparedness*, which relates to the extent to which pandemic policy can accurately respond to the occurrence of a future pandemic. Pandemic preparedness counters the idea that COVID-19 is a one-off disaster with the notion that viral pandemics may become a regular feature in the near future, a view increasingly supported by epidemiological and public health science. Against this background, there is a strong social and moral obligation for policy instruments to be designed to anticipate and respond in a robust and agile manner to the emergency of a new virus. The objective of pandemic preparedness is to prevent or minimize widespread harm and suffering associated with lockdowns by having well-tested systems in place that can be activated at a moment's notice. Here again

a short-term EBI may be of limited use in terms of the forward-looking policy response.

There are two pathways to expanding on the one-off EBI model to better address both pandemic recovery and pandemic preparedness. The first approach is the *switch on/switch off* model, which involves having EBI on standby under normal circumstances but ready to activate as soon as a pandemic emergency occurs. In emergency mode EBI is rolled out for a short duration but in post-emergency mode EBI remains fully dormant, effectively only existing "on paper." The legislative and administrative processes underlying EBI activation each time an emergency is called involve considerable time and effort at the level of both political decision-making and practical implementation. This in turn also translates in potential delay, error, and uneven or sluggish rollout.

A second pathway would appear to avoid the downsides of the switch on/switch off model. An alternative *dial up/dial down* model combines both EBI and UBI in a two-stage policy instrument. In this scenario, a very modest but permanent UBI is introduced that remains in place independent of any emergency arising. In the event an emergency is called, the level of the existing UBI is upgraded in the form of an EBI top-up to whatever level is deemed politically necessary. The EBI top-up is dialed down again as soon as the most stringent pandemic restrictions are relaxed (or whenever decision-makers deem a sufficient recovery period has passed) but the UBI floor always remains in place throughout the down period. The main difference with the switch on/switch off model is that this alternative only requires an additional budget decision since the policy in fact is already in operation. This will avoid the errors and delays of having to activate on the EBI from scratch each time. In addition to better fulfilling the objective of immediate pandemic responsiveness, it also satisfies the requirement of pandemic preparedness. And because the UBI remains in place even when the EBI top-up is dialed down, it will have a continued positive impact on pandemic recovery.

## Definition

A boycott is variously defined as the withholding of certain types of social or commercial interactions with another person, business, corporation, organization, or nation. The reason for this withholding varies, but it generally expresses disapproval, is intended as a form of punishment, or is used as a means of forcing acceptance of certain terms.

Although boycotts have been widely used as a form of social protest, very little has been written about their structure and moral justification. As the definition above suggests, at least one reason for a boycott is to use force (presumably coercive force) to compel compliance. But the use of force necessarily brings with it moral considerations. Is the force justified? Is it excessive? Can the desired outcome of the boycotters be obtained without force? Similarly, the use of force raises questions as to the appropriateness of the outcome desired. Is the boycott intended to force an individual, business, and corporation to change its actions, beliefs, or both? All of these questions seem relevant when examining the ethics of boycotts.

## Types of Boycotts

Boycotts can be categorized by both their target and their makeup. One type of boycott is the commercial boycott. The commercial boycott targets a business or corporation for its business

practices. Similarly, a political boycott targets a political entity, for example, a nation or a state for its governmental practices. Mixed boycotts are those that target a business or corporation because of its extra-business stance or activities.

In addition to the target of a boycott, a further distinction is possible, namely, who is engaging in the boycott. It is possible then to distinguish between an individual boycott and an organized boycott. An individual boycott is one in which an individual chooses to refrain from interacting with a company or business. Although his or her boycott may not affect any measurable change on the part of the target, they may still engage in the action on deontological grounds or on the grounds of personal integrity. On the other hand, an organized boycott calls on a number of individuals to exert some sort of coercive force on an individual, company, or state. The organized boycott is the type often reported in the news, particularly when it is effective.

While the distinction between commercial, political, and mixed boycotts is fairly uncontroversial, the individual versus organized is less so. There is some question as to whether a boycott is by definition a concerted effort to force some change from its target. An individual boycott does not necessarily call on others to follow suit since individuals are free to either engage or not engage in exchanges with others. One is not morally obligated to do business with any particular company, and given that their withholding of business is unlikely to exert coercive force, is it really a “boycott”? Still, the fact that one intends to express disapproval (as opposed to expressing a simple preference for one brand or company over another) may on some accounts be a sufficient condition to view individual boycotts as a distinct category.

## Reasons for Boycotts

The justifications for engaging in boycotts generally fall into one of two categories. The first justification is the strategic justification. When boycotts are engaged in for strategic reasons, the intent is to change the actions of a

business, corporation, state, or nation. Whether the target comes to accept that the alternate action, policy, or procedure is morally better is irrelevant. The desired outcome is a change in the actions of the target of the boycott, not to engender some moral epiphany.

In contrast to the strategic justification for boycotting, other boycotts do seek a moral conversion. What Claudia Mills has termed “integrity boycotts” have as their desired outcome a change in the beliefs, attitudes, or views of the target of the boycott. On this account, a boycott may only be partially successful or even unsuccessful if the target fails to embrace the views of the boycotter. As Mills has noted, the nonstrategic boycott is problematic since it is unclear when a boycott could ever end. For example, even if a company changes its practices, it might never acknowledge its wrongdoing, thus the possibility of a never-ending boycott.

## Types of Acts That May Be Boycotted

The distinction between strategic and integrity justifications for boycotts introduces considerations that enter into determining the moral justification for engaging in a boycott. Whether a boycott is intended to change an action or a belief is a morally relevant consideration. Strategic justifications can be viewed as a reaction to the former, while integrity justifications can be viewed as a reaction to the latter. The type of act being boycotted may suggest the moral appropriateness of the boycott. Two such acts that are morally significant are consequential acts and expressive acts.

Consequential acts are actions that are either illegal or unethical and can be said to be the proximate cause of harm to others. In such instances, the moral justifiability of a boycott depends on a principle of harm. If a person, corporation, or state is engaging in demonstrably harmful acts, then *ceteris paribus*, a boycott that attempts to coercively stop this act is morally justified.

Unlike consequential acts, expressive acts are those that express certain beliefs, attitudes, or

views on a subject or issue. As was mentioned, integrity boycotts are often used to target what the boycotters view as holding problematic opinions or beliefs. But the attempt to silence unpopular opinions is fraught with moral danger. While attempts to stop harmful actions may be morally justifiable, attempts to forcibly change one's opinions or beliefs are not. For example, while one may think their religion is the "correct" one, it would be wrong to try and force those religious beliefs on another.

The distinction between consequential and expressive acts is not always clear. In certain instances, there may be a third type of action that may be the target of a boycott, namely, mixed acts. Some expressive acts may result in harm to others, even when they only purport to express some opinion or idea. For example, expressed racist, sexist, or homophobic ideas may create a climate that harms certain individuals or groups. Whether these are appropriate targets of boycotts – or unpopular opinions that must be tolerated in the marketplace of ideas – is an open question.

## Ethical Considerations

It has been argued by economists and right-libertarian thinkers such as Murray Rothbard that boycotts are per se always morally permissible because they do not involve coercive force. The denial of coercion in boycotts is questionable, as there appear to be a number of factors that can be considered regarding the moral status of any given boycott.

A morally defensible boycott is determined by which type of action is being targeted and whether that action is a legitimate candidate for the use of coercive force. As was noted in the previous section, boycotts intended to change beliefs or opinions require greater justification than those intended to change harmful or illegal actions. Still, even when a boycott is targeting consequential acts, there are additional questions that can be raised with regard to its moral permissibility. Some of these include the following: Is the boycott likely to be effective? Will it be unfair, that is, will it harm those least responsible for the

wrongdoing (e.g., the laying off of low-level employees)? Are the effects of the boycott indiscriminate, as in the case of boycotts of states in which individuals that did not condone the state's actions are harmed (e.g., hotels, restaurants, etc.)? The coercive nature of boycotts coupled with the harm they may incur when attempting to obtain a morally better outcome entails that the morality of any given boycott involves a multitude of considerations.

## Ethics of Meaningful Work

Howard Harris

## Synonyms

Humanistic human resource management; Meaningful jobs; Well-being at work

## Introduction

Meaningful work is perhaps best understood in contrast to useless toil. The dangers of repetitive, thoughtless work were noted by Adam Smith in the *Wealth of Nations* (1970 [1776]) and by Karl Marx in *Das Kapital* (1976 [1867]). They saw how such work took away autonomy and left workers unsatisfied. The ancient Greek poet Homer provided an even earlier example in the *Odyssey* where Sisyphus is found at an endless task, pushing a stone uphill only to have it run back down to be pushed up once more (Camus 1955). Many people in contemporary industrial societies work at repetitive jobs. Thus, “meaningful work,” work that does not involve human depredation, is widely seen as desirable, although there is little agreement on a formal definition or on its characteristics.

In one sense, meaningful work is work that helps to give meaning to human life. This suggests that there is more to meaningful work than happiness or adequate compensation. Although there is widespread agreement that someone who is engaged in persistent, stultifying activity at work is hampered in intellectual development outside work, meaningful work is not of itself sufficient for a fulfilling life. As an extreme example, including the word “meaningful” in a job description or even in the job title does not ensure that this will be meaningful work. Two other uses of the word “meaningful” help to flesh out the definition. Meaningful work is substantial, nontrivial work, as “meaningful savings” is taken to mean savings that are significant. Meaningful work is not determined by the task alone and cannot be expressed directly, as the “meaningful glances” or “meaningful expression” that might accompany and add to spoken communication have an existence apart from the words of the communication itself. Hence, whether work is meaningful cannot be determined apart from the person doing it.

## Approaches

When work is meaningful for an individual there is a feeling that it involves something beyond the activity that the work entails, that it is more than

just a job. This something extra can be described in terms of outcomes or in terms of inputs. Both approaches yield helpful insights into the nature of meaningful work and how it might be fostered. Looking first at outcomes, meaningful work may meet a need or resonate with the beliefs and values of the individual. Both are outcomes beyond the product of the worker’s labor and, while the personal needs that work can meet might include needs for self-actualization, personal development, and contributing to the good of the world, they might also include a need for (money that can be used to procure) food and shelter. Viewed in this way, work can be meaningful, in the sense of satisfying a personal need, without having meaning, namely without contributing to personal well-being beyond human survival. Alternatively, meaningful work can be considered in terms of the degree of alignment between the individual and the work. From an individual perspective, the extent of any fit between self and work is strongly influenced by how that individual sees him- or herself and how he or she views the work. Two people may view the same work differently, one finding it meaningful while the other regarding it as debilitating and perhaps even repulsive. Looking at the inputs to meaningful work, the primary focus will be on the nature of the work itself, recognizing certain characteristics of the job as key to the work-individual fit, and employing techniques such as job rotation and job enlargement to increase the possibility for the work to be seen as meaningful. Complexity and autonomy of decision making are also seen as characteristics of meaningful work.

## Benefits

For some, meaningful work is a desirable end in itself, contributing to personal growth and well-being. Studies also show that meaningful work is linked to a range of outcomes such as increased job satisfaction, greater motivation at work, engagement, attachment, and citizenship behaviors. Although these are in the first instance benefits for the individual at work, studies have shown that they are positively related to organizational performance, thus providing an economic justification

for actions to enhance the provision of meaningful work. Wider society can also benefit from meaningful work, as a greater number of people are satisfied or fulfilled in their work and there is greater recognition of how jobs can contribute to the welfare of others.

## Contrary Views

The notion of meaningful work has been questioned on the basis that: it fails to respect the individuality of humans, it overrates the importance of work in human lives, it is unduly subjective, and it requires of employers more than is proper. In a society where human resource management practice and much organizational theory tends to view people as resources, efforts in organizations to enhance meaningful work can be viewed, cynically, as part and parcel of a managerialism focused solely on profit and unconcerned for the rights of workers. By recognizing that work only occupies part of the day and part of the lifetime of individuals in society, and placing emphasis on the responsibility of a society to enable its members to lead a fulfilling life as a whole rather than solely through employment, the importance of meaningful work in establishing meaning in life is reduced. Given that meaningful work involves the satisfaction of a personal need or an alignment between work and personal beliefs, the assessment of whether or not some specific activity can be called “meaningful work” cannot be objectively determined. No external examiner can authoritatively say whether or not some other person who is observed by the external examiner finds meaning in the work in which that other person is engaged. All reports of meaningful work are self-reports, and the attendant subjectivity cannot be expunged. When business subscribes to a philosophy of maximizing return to shareholders, then meaningful work, to the extent that it reduces the scope of action by owners and managers, would be seen as an unwarranted imposition. None of these objections has yet been able to overcome the groundswell of popular support for the concept of meaningful work.

## Ethics

Interest in meaningful work has a clear ethical basis, because it is grounded in a repudiation or distaste for employment that places humans in situations that can lead to alienation and treat people as means to an end. An ethical justification for this reaction against meaningless work can be found in each of the main approaches to ethical decision making – consequentialism, deontology, and virtue. In a consequentialist or utilitarian approach, meaningful work will increase satisfaction or happiness; deontological approaches, such as that of Immanuel Kant, require respect for humans; while in virtue ethics the denial of meaningful work would limit the opportunity for personal fulfillment and character development. Meaningful work also finds support in the notion of human rights, where autonomy and dignity are seen as natural rights of all individuals.

This ethical underpinning can be taken to mean that there is a moral obligation to provide meaningful work. The stakeholder approach to business and management, where there is a moral obligation to take into account not only shareholders but also all those on whom the business depends for its survival and support, favors the view that organizations have a moral obligation to provide meaningful work. Hence, providing meaningful work can be seen as an aspect of Corporate Social Responsibility. However, those who adopt a classical economic approach to business decision making, seeking to maximize shareholder value, would deny that there was any obligation to provide meaningful work if it were to reduce returns to shareholders.

For an individual to find meaning in work requires a “fit” between the tasks involved in the work and the individual’s beliefs, including that individual’s notions of a fulfilling life and the extent to which he or she sees life as a search for meaning. This could give rise to an obligation on individuals to engage in meaningful work as part of their pursuit of personal fulfillment. Herein lies a great contradiction, that in the heart of ordinariness, in the crushing desperation of seemingly useless work, a human being can, by concentrating on what he or she can control, find a fulfilling life. Camus (1955), in his

essay on the myth of Sisyphus, explains how Sisyphus can be happy notwithstanding the repetitive and seemingly fruitless task in which Sisyphus is engaged.

Further ethical questions arise regarding the extension or applicability of the concept of meaningful work to animals, and to children or adults outside the regular workforce.

## Ethics of Music Teacher Education in Postcolonial Countries

## Introduction

Colonialism establishes and maintains certain relationships and power dynamics. Education as a mechanism for government control echoes and amplifies those relationships. Colonizers begin with the assumption of superiority over local people, seeing their own knowledge, culture, religions, language, and ways of living as advanced and therefore superior and as such to be enforced. Through this enforcement, colonizers seek to expand their territory and to turn local or indigenous people into workers in service of the colonial project: take over and expansion. For this process to happen effectively, it requires local people to acquire sufficient language, culture, and knowledge to be of use, but not enough to be critical or revolutionary against colonialist rulers.

## Education under Colonialism

During colonialism, education's purposes were co-opted by the colonizers to serve outcomes determined not locally or even nationally but rather as a mechanism of colonial rule and control. Education was focused on training local people to fulfill specific roles in the governmental structures. Colonized people had to ignore, suppress, or abandon their own knowledge practices and culture in order to adapt to the colonizers' expectations.

This view of teaching aligns with Paulo Freire's (2003) notion of *banking* where students are considered empty vessels into which teachers pour the necessary knowledge, and this knowledge is then repeated back to the teacher to demonstrate learning. The teacher gives no consideration to what the students might know or understand from their experiences and instead assumes that any knowledge of value or use must come from them. Students are thought of as objects, not subjects. In colonial settings, the knowledge considered valuable was that of the colonizer, with language being the most important, a belief that has persisted to this day.

The role of the teacher in colonial times was as an intermediary between the colonial government

and the local people. As such, teachers had to be educated to a certain degree in order to transmit knowledge to their students, but too much knowledge was considered a threat to those in command (Assie-Lumumba 2012). Thus, notions of what it meant to fulfill one's role as a teacher were informed by functionalist technical views of knowledge and learning. Teachers were not given responsibility for deciding or developing content or ways of teaching; they were given material to teach, and their duty was to deliver it. This view of teachers did not position them as professionals with independence and agency but as laborers in the service of more knowledgeable and powerful superiors.

The ethical implications of colonial control in education are many and complex. Rather than education being about young people's right to growth, self-determination, or a good life, it was designated as a mechanism of control, domination, and suppression. In South Africa, for example, education became an instrument of apartheid, separating blacks into one class who attended schools that prepared them to be servants (and therefore subservient) in the colonial machine, while white elites were educated in exclusive private schools, either in the colonial territory or in the homeland, with the purpose of becoming leaders and taking on key professional roles such as doctors, lawyers, and judges, those who would hold a high status, salary, and power position in the colonial system. Colonizers treated indigenous people primarily as a labor force and therefore as inferior and deserving of inferior education and fewer rights.

This inheritance continues to shape education and therefore music education in many locations. Just as the colonizer's language is widely adopted as the language of instruction, Western European concepts, theory, and instruments are still used to learn about music. And while curricula have expanded to become more multicultural in many places, the dominance of Western music remains. For example, the use of notation is often accepted as the norm even as it serves to misrepresent musical practices that have never been written down, and learning to read from notation can

pose significant challenges to those who have learned music aurally.

Music is social and as such is deeply connected to people and identity (Bowman 2007). Traditional and folk musics are largely facilitating of social interaction and can be ill-suited to an educational structure built around music written for technically flawless presentation to a silent audience. Musics familiar to students are "othered" (Said 1978), thereby continuing to serve and perpetuate the colonial project. When music in schools is focused on classical music to the exclusion of popular and indigenous musics, it can lack relevance and meaning for the students and teachers. The focus on Western classical music and concepts disrupts communal and participatory (Turino 2008) ways of music-making which technicist schooling only serves to emphasize.

Music is often undervalued as part of education in places where it thrives in the community and where music education has become separated from and irrelevant to community and local understandings of music making. Schools emphasize math, language, science, and technology resulting in teachers with little by way of experience or knowledge in music to support their delivery. Teacher preparation may not have the same expectations in terms of specialized knowledge, and very little at all by way of formal preparation may be required to teach music. This can lead to music teachers following historical patterns of teacher-centered pedagogy and Eurocentric content. The inherited reliance on, and reverence for, Western knowledge is maintained, and the technical structure of objectives and assessment means teachers feel pushed into delivery (banking) style teaching which can often stray far from music as a practice at all, let alone one emerging from the local context.

To understand music and education as practices is to see them engaged with questions of what is good and right to be as a musician and a teacher, with human flourishing as central, both individually and in community with others. North American music education is considering the potential of the "practical turn" although this philosophy has been slow to realize (Bowman 2012). Given that music education in the West is

weighing up many of the same concerns as post-colonial education systems, specifically teacher-centered instruction and the enduring supremacy of Western classical music, this shift could be of benefit beyond the Global North. Key in this viewpoint for music education is a move away from following prescription, rules, and codes and toward dwelling on the internal goods of music education and the foundational questions about the value worth and purpose of that practice. Restoring education and music to moral and political practices, rather than scientific “delivery mechanisms” focused on utilitarian ends, renders them “sites of human flourishing” (Schwandt 2005) with human interaction at the center. To conceive of music education as solely performance may be to bypass music’s value for education (Schwandt 2005; Bowman 2001).

## Ethics of Tax Reform

Joanna L. Garcia

Boler College of Business, John Carroll University, University Heights, OH, USA

## Synonyms

Tax act; Tax code; Tax law changes

## Introduction

Changing a country’s existing tax laws is a complex and politically charged process. While the details can be highly technical, the overall goals of tax reform should include improving the tax system on at least one of several dimensions. As individual and institutional taxpayers are affected in real terms by changes, tax reform should be undertaken with an ethical intentionality and genuine acknowledgment of these real impacts.

## Describing a “Good Tax”

Accountants and economists generally agree that a “good tax” should have certain characteristics. Though theorists may describe these characteristics differently, they generally include some discussion of sufficiency, efficiency, equity, economy, and convenience. Adam Smith first delineated several of these characteristics in *The Wealth of Nations* (Jones and Rhoades-Catanach 2010). A sufficient tax provides enough revenue to the government to enable it to provide public goods and services to its citizens. Traditionally, an efficient tax generates revenue without introducing economic distortions caused by changes in taxpayer behavior. However, some economists, including John Maynard Keynes, have stated that taxes should be regarded as a tool for governments to encourage or discourage certain behaviors in order to steer the economy in a desired direction. Thus, an efficient tax changes behaviors sufficiently to meet fiscal policy goals (Jones and

Rhoades-Catanach 2010). Equity can be thought of in two dimensions, horizontal and vertical. Horizontal equity means that two individuals in similar circumstances should pay the same amount of tax. Vertical equity means that an individual with greater means should pay more taxes than an individual with lesser means. Economy refers to the costs of administering and complying with the tax system, which should be minimized. Convenience means that the tax should be collected in a manner that is not burdensome to either the taxpayer or the government. Economy and convenience are often combined into a single characteristic: simplicity.

While these characteristics are straightforward in theory, applying them to actual tax systems can become quite complicated, and few, if any, tax systems will achieve them completely. They are also subject to interpretation that can be influenced by political objectives. For example, vertical equity requires that taxpayers pay more as their ability to pay increases. This can be interpreted as supporting a flat tax, where wealthier individuals pay more taxes in dollars; it can also be interpreted as supporting a progressive tax where wealthier individuals are subject to a higher tax rate (Spilker et al. 2013). Another example relates to the sufficiency of a tax system, which is closely tied to the level of goods and services provided by the government. A government that provides more naturally requires more revenue, but determining the appropriate level of government spending is a significant and potentially divisive political issue.

## Tax Reform

When evaluating a tax system on these characteristics, a distinction must be made between tax *reform* and tax *design*. The design of a new tax system from scratch can focus on fulfilling the ideals of Adam Smith and other theorists, but the reform of an existing system is inextricably tied to the policies, practices, and expectations currently in place. There is a starting point that cannot be ignored (Feldstein 1975). This starting point means that it is likely (and perhaps unavoidable)

that improving the system with respect to one characteristic will have consequences for other characteristics. For example, eliminating tax preferences (credits, deductions, exemptions, preferential rates, etc.) can greatly simplify a tax system but may reduce vertical equity by ignoring real differences in the ability of various taxpayers to pay. Additionally, in comparison to treatment under the current system, tax reform will always create winners and losers, taxpayers who are better or worse off, either in the absolute or relative to other taxpayers. Tax reform can also adversely affect taxpayers who made choices under current law that they would not have made under the new law (Feldstein 1975). Feldstein (1975) suggests that postponing the effective date of tax reform can at least partially mitigate these adverse effects by enabling taxpayers to make more informed decisions and by lowering the present value of any losses incurred from past decisions.

## The Process of Tax Reform

Tax reform, like any legislative action, is an inherently political process. Though citizens generally agree that taxes are too high, too complex, and too unfair, reaching consensus about how to fix these problems is an elusive goal. In the United States (and many other countries), the issues of who, how, and how much to tax differentiate political parties like almost no other issue (Slemrod and Bakija 2008). For this reason, though the need for tax reform is widely acknowledged, actual comprehensive tax reform is rare and difficult to enact.

As a political action, and a highly technical undertaking, tax reform is also subject to the involvement of many different interest groups, with varying degrees of objectivity. Tax experts and academics are typically invited to weigh in, corporate and special interest lobbyists are highly engaged, and the public is continually polled to assess their opinions, including how they might react during the next election cycle. In their discussion of the Tax Reform Act of 1986, Doernberg and McChesney (1987) state that the members of the House Ways and Means Committee and the Senate Finance Committee, the

congressional bodies responsible for tax legislation in the United States, received \$19.8 million dollars from political action committees and other sources in 1985, which was twice the amount received in 1983 (the most recent non-election year).

In case studies of tax reform in various countries, Bird (2004) identifies several strategies for improving the odds of successful implementation in developed countries. He first states that large-scale tax reform, if it can be accomplished, is more effective than taking smaller, incremental steps, which may lose sight of overall objectives. He suggests that ample time should be taken to ensure that options are fully evaluated. While open discussion and consultation are important, leadership is required to ensure the process continues to move forward. There should be a strong political will for reform, with champions of the reform supported by the chief executive. The benefits of the plan should be substantial and salient enough to citizens to outweigh the downsides. He also mentions the importance of “a strong technical team, integrating legal drafting with policy-making, drawing on private sector expertise, [and] developing a good programme of education and guidance” (Bird 2004, p. 52).

## Tax Reform in the United States

Though major tax reform is rare, the United States Internal Revenue Code has been subject to change relatively frequently. During the last 10 Congresses, dating back to 1997, an average of 3.5 tax laws have been enacted each year, and 146 tax laws have been enacted since 1973 (US Congress 2018). Most of these are specific and small in scale. Comprehensive tax reform has occurred only four times. In 1939, existing tax statutes were initially codified into the Internal Revenue Code. Major overhauls were undertaken in 1954, 1986, and most recently in 2017.

The Tax Cuts and Jobs Act of 2017 (TCJA), like most major legislation, had equally strong and outspoken supporters and detractors. In keeping with Bird’s (2004) thoughts about how to successfully enact tax reform, it was a significant

change from existing law, though still a progressive income-based tax, as opposed to a flat tax or a consumption tax as some have advocated. It had powerful champions, including Chairman of the Senate Finance Committee Orrin Hatch and Speaker of the House Paul Ryan. President Donald Trump was also extremely invested in the process and ensured continuous forward progress. Critics have suggested that the process was too fast, did not allow for sufficient discussion and exploration, and that tax policy experts were involved to a much lesser degree than in the past (Slemrod 2018).

Now that the TCJA has passed, analysts have begun to investigate the potential impact of the new law. Though the designation of “winners” and “losers” may be influenced by political perspective, not the least being whether one supported or opposed the legislation, some general observations can be made about how different taxpayers will be affected. Corporations will receive many benefits from the new law, including a new flat 21% tax rate, elimination of the alternative minimum tax, and expansion of fixed asset expensing provisions. Owners of pass-through entities, such as S corporations and partnerships, may be able to deduct up to 20% of their business income. There are also some losses for corporations, including the elimination of the Domestic Production Activities Deduction and carry back provisions for net operating losses (Kula 2018). Multinational corporations will also likely benefit from the transition to a territorial tax system, with a low tax rate on global earnings intended to make it easier and cheaper to bring foreign cash back to the United States (Rappeport 2017). Whether the projected tax savings for corporations will be reinvested, distributed to shareholders, or paid to employees remains to be seen.

On the individual side, most taxpayers will see a decline in their tax liability, though the size of the benefit is significantly larger for upper-class taxpayers (Urban Brookings Tax Policy Center 2017). The Tax Policy Center, a non-partisan think tank, estimates that taxes will decline for the bottom quintile of taxpayers (income less than \$25,000) by about \$60 or 0.4 % of after-tax income. For the middle quintile of taxpayers

(income between about \$49,000 and \$86,000), the decline is about \$900 or 1.6 % of after-tax income. For taxpayers in the 95th–99th percentiles (income between about \$308,000 and \$733,000), the decline is about \$13,500 or 4.1 % of after-tax income (Urban Brookings Tax Policy Center 2017).

Due to a change in the methodology for indexing certain amounts for inflation, the declines for all taxpayers will shrink over time, with benefits to higher income taxpayers continuing to outpace others. That change, combined with the sunset of many of the TCJA's individual tax provisions after 2025, may actually lead to tax increases for 53% of taxpayers in 2027, compared to current law (Urban Brookings Tax Policy Center 2017), though many expect the provisions will be extended at that time.

### Is the TCJA “Good” Tax Reform?

The TCJA can be evaluated based on the characteristics of a “good tax” as described earlier (sufficiency, efficiency, equity, simplicity). Though there is the potential for partiality in such an evaluation, these characteristics at least provide a neutral starting point. A comprehensive analysis of the long-term economic outlook is beyond the scope of this article, but the Congressional Budget Office has projected a cumulative deficit increase of \$1.6 trillion over the 2018–2027 period. This increase reflects reduced revenues (primarily driven by decreased individual income tax rates) and increased spending, partially mitigated by faster than expected growth in the general economy, wages, and corporate profits (Congressional Budget Office 2018). Reduction of the corporate tax rate, changes in taxation of foreign-source income, and the qualified business income deduction are intended to increase efficiency, but will likely spur taxpayers to seek new methods of exploiting the boundaries between ordinary income and preferentially taxed business income (Galper 2018). Researchers have predicted that the increase in the standard deduction will reduce charitable donations by 4%, or

\$17.2 billion, as not itemizing deductions raises the after-tax cost of donating (Brill and Choe 2018). As described earlier, equity is very much in the eye of the beholder. High-income taxpayers will receive a larger share of tax cuts, both through the changes in individual rules and changes to the taxation of business income, from which they are more likely to benefit. This allocation of benefit may be seen as making the tax law more or less equitable, depending on one's beliefs about the optimal distribution of tax liability. Changes to the individual tax rules are largely intended to simplify the tax code. The alternative minimum tax has been scaled back and will apply to far fewer taxpayers. The increased standard deduction is expected to greatly reduce the number of taxpayers that itemize deductions, which reduces the administrative burden of tax preparation and decreases the opportunity for accidental or intentional misstatements of taxable income. On the other hand, taxation of foreign-source income and pass-through business income are significantly more complex, and will increase the compliance burden on affected taxpayers. In addition, the uncertain future of the individual provisions of the TCJA, which are set to expire after 2025, make it difficult for taxpayers to plan for the long-term.

### Conclusion

Tax reform is a complex, political, and emotional issue that may be driven by basic notions of fairness of both citizens and elected officials. The theoretical characteristics of a “good tax” can guide the process, but it is difficult or perhaps impossible to address all of these principles simultaneously, and their application can be influenced by underlying beliefs about wealth distribution, government spending, and basic fairness. While it is unlikely that any significant legislation could fully satisfy all stakeholders, it is incumbent on decision-makers to at least consider the interests of different constituent groups as they undertake such reform.

## Ethics, Craft, and the Business of Music

## Introduction

Ethical decision-making in music and the business of music involves the intersection of moral philosophy and the world of action, consideration of which raises the central question of the basis for such decisions. The grounds for ethical decision-making are multiple and varied, and oftentimes decisions are rooted in more than a single ethical framework. What follows is a brief exploration of three ethical positions commonly encountered in the music business – consequentialist ethics, virtue ethics, and deontological ethics – with particular attention given to the latter and its significance for ethical decision-making in the domain of craft.

The business of music covers an extensive terrain including a broad range of skills, activities, individuals, and organizations. This domain includes solo musicians (pianists, singers, violinists, guitarists, etc.) and countless musical ensembles from professional orchestras, opera and ballet companies to “pop” and indie bands and artists; the work of composers, arrangers, conductors, coaches, and teachers at all levels, as well as instrument makers and technicians, critics, musicologists, and educational institutions including conservatories of music, university music schools, and public schools engaged in music education; finally, it includes the work of media, management companies, and the many commercial enterprises that publish and disseminate music and materials related to the music industry.

## Consequentialist and Virtue Ethics

Throughout all facets of this diverse industry, individuals and institutions make decisions on a daily basis about what is right and what is wrong, and, as one might anticipate, most ethical issues encountered in these various contexts are common to those routinely addressed throughout the business world. These include issues pertaining to the fiduciary responsibility of individuals for institutions or companies and other matters related to financial rectitude (both personal and institutional); challenges encountered in complying with union agreements; issues that relate to human relations in the workplace including sexual exploitation, racism, and bullying; and dishonesty that is not financial in nature such as lying, cheating, and deceit – behaviors that demonstrate a lack of integrity and result in the breach of trust of colleagues, employers, and the public.

In an attempt to address these issues, individuals and organizations in the music sector, like those in the business world more broadly, commonly rely on one or another form of consequentialist ethics where it is understood that the consequence of an act is the ultimate basis for determining the rightness or wrongness of the action. From such a perspective, morally right action is that which results in a positive outcome. This, of course, begs the question, “A positive outcome for whom?” Precisely who benefits from the action depends upon the particular form of consequentialism adopted. For example, a “rights-based” approach intends to address the moral rights of others; the “fairness/justice” approach interprets the moral good as actions that treat all persons equally or fairly; and the “common good” approach views the welfare of the community to be among the highest goods, and therefore morally right action is that which contributes to the betterment of the community (however that is interpreted). One also encounters the egoist model by which actions are taken that result or are likely to result in the most favorable outcome for the agent making the decision.

A second model of ethical decision-making commonly utilized in music and the broader business community is known as virtue ethics which

focuses on the moral character of the agent. Theoretically, a virtuous person is both able and likely to act in accordance with the virtuous qualities that are typically associated with her or his character and human identity such as honor, respect, honesty, loyalty, humility, prudence, authenticity, and commitment to excellence. For this reason, employers commonly require “character” references as part of their hiring process on the assumption that a person with a good or virtuous character will act morally in the context of their work and prove to be of greater benefit to the organization than an individual with a morally dubious character. Most sectors of the music industry incorporate virtue ethics as part of the overall mechanism by which they attempt to cultivate ethical decision-making in their environment.

## Deontological Ethics and Craft

As previously noted, much of the diverse body of ethical issues encountered in the music business is in fact common to those encountered in the broader business community. However, there exists a range of issues that pertain to music and more broadly to the world of craft that are notable and merit exploration here. The term craft is commonly understood as the “*experience* of making things and fixing things” (Crawford 2009). In the domain of music, the term is associated with such things as musical performance, musical composition, the making and repair of musical instruments, as well as the craft of writing of the music critic or musicologist. For the agents involved in each of these areas of craft-making, the central ethical framework that guides decisions concerning right and wrong action is deontological. That is to say, agents involved in craft-making rely extensively, though not necessarily exclusively, upon a deontological ethic that emphasizes personal responsibility, duty, and the exercising of the will. Moreover, the demands of craft are understood to present a performance obligation which in turn constitutes a moral responsibility for the agent as craftsman or artisan. This performance obligation takes the form of an imperative to undertake an action

understood by the agent as artist, artisan, or crafts-person to be both necessary and right. The mode of deontological ethic that applies here is less a constraint of rule, though there certainly are rules to be observed (it is expected, e.g., that violinists in a symphony play in tune), but an exercising of the autonomous will and fine judgment in accordance with what is understood by the agent in question to be artistically “best” or “right” in a particular context. The work well done is good and the consequence of such right action is its own reward.

What then are the essential elements of human behavior of a craftsperson whose work meets the standard of right conduct or practice according to a deontological ethic? To begin, ethical and responsible practice is marked by a high order of attentiveness. In response to the distractions of ordinary experience, various monastic traditions in the Christian Orthodox and Catholic communities, as well as in Buddhism, Hinduism, and Jainism, establish rigorous structures sometimes including both seclusion and silence to ensure opportunity for contemplation and to facilitate opportunity for undivided attention directed toward a particular practice or object of desire. As part of the strategy to address attentiveness, monastic spaces are designed to provide a measure of isolation that permits a psychological and emotional distancing from the surrounding environment. Similarly, those engaged in the work of craft-making find that establishing spatial separation from their environment is critical to success, for which reason musicians, writers, and other craftspeople construct special places of work (studios, practice rooms, dens, libraries) that enable both seclusion and silence. The creation of such a space is akin to the walling of a garden which not only encloses a private ground or territory but also serves to separate the worker from the horizon, for the horizon speaks of possibilities, memories, and desires, all of which draw the mind away from a single point of attention. Whatever accommodations are made to assist in the elimination of distraction, attentiveness ultimately and necessarily involves an act of the will – the faculty of choosing and acting – for it is the exercising of the will for the purpose of narrowing the field of

one’s engagement that is critical to the ethical practice of the musician’s craft. The periodic failure to accomplish the task at hand is oftentimes due to a failure of will, the failure to commit to the demands of isolation and attentiveness and the singular demands of attentive labor.

A second feature of ethical practice in the domain of musical craft is an authentic engagement with the labor at hand, labor that is marked by a willing identification of the craftsperson with the work and process that work entails. The labor of craft requires continuous discernment, assessment, and reassessment of even the most minute detail. A pianist, for example, may intend that a crescendo extend over two and a half measures and that it begin again eight measures later at a dynamic level fractionally less than that of the previous iteration. The difference between the dynamic levels of the two iterations may be marginal, but to the performer, the level of variance is critical to effecting the intended level of subtlety and precision. Failure to realize precisely the intended level of dynamic variance produces in the performer a sense of frustration and unhappiness with this particular segment of the performance. Such fine discrimination and expectation of the self as artist/performer is a marker of an authentic engagement with the work and an ethical healthy interaction between the musical agent and the work. This level of engagement with the material, of action and assessment, necessitates an intimacy between the agent and the process or work at hand such that the craftsperson/performer experiences and acknowledges a link between his or her artistic identity and the quality of the performance or musical labor. As such, the agent as craftsperson is not indifferent to the outcome or the process, for the outcome is the consequence of his or her own artistic decision-making. Accordingly, where the musician acts ethically, the assumption of personal responsibility for the action is understood as a necessary condition. Failure to assume a relationship of intimacy and responsibility for artistic action and outcome constitutes an ethical failure. Such failure is often marked by indifference, which results in negative consequences for the quality of the process and product generated. In the context of a professional

orchestra, for example, such indifference may result in a compromised performance not only of the individual but the ensemble as a whole. Indifference to the demands of the craft and the work at hand is an ethical issue insofar as it constitutes a failure to exercise one's capacities in the realization of a task one names as one's own and is proper to one's capacity and identity as a crafts-person. Moreover such failure often has consequences for others – one's employer, colleagues, and audience.

Many craftspeople understand their work as vocation, that is, as a chosen labor that extends beyond the transaction of labor for financial recompense. Such labor is enacted out of a love of the activity; of the creative, imaginative world it embraces; and on account of the pleasure and deep satisfaction such engagement engenders. This sense of vocation may involve something akin to that which in religious circles is termed a "calling." It is an activity with which the individual senses a deep partiality, affection, and kinship; it involves an emotional closeness and, as noted, is tied to a sense of personal identity and purpose. This deep engagement is the privilege of the few who possess both understanding of the medium and the technical and manual capacity to both comprehend and generate a desired expressive outcome. For those who view craft as vocation, there tends to be an intrinsic motivation to excellence and a self-motivation to produce at the highest artistic standard possible given the limiting factors peculiar to the agent. Where the intrinsic demands of artistic vocation are consistently breached or negated, there may occur a diminishment of the artistic self which in turn holds implications for the employer and public. Where there exists a robust artistic integrity and a commitment to artistic practice, the relationship of the crafts-person to the employer and audience is typically not merely contractual but rather more akin to covenant with an emphasis on the inherent responsibility of the agent. Indeed, in an ideal context, responsibility for action is found on both sides of the equation – performer/crafts-person and audience/percipient. The one brings the best of his or her creative, imaginative, interpretive work, regardless of the level of

financial recompense, and the other brings an attentiveness to the performance, a willingness to see and hear, to discover the riches of the work and the merits of the particular performance or product at hand.

Ethical behavior throughout the business world is rooted in trust, integrity, and respect for the other. In the subset of music and business, and more specifically in the business of the making of music, an authentic caring for one's craft is critical to music both as business and as a mode of profoundly human endeavor.

## Introduction

Since around the middle of the twentieth century, and in part due to the work of, among others, G.E.M. Anscombe (1958), there has been a resurgence of philosophical interest in the concept of *eudaimonia*, roughly translated as “flourishing” or “happiness.” (These terms will be used rather interchangeably moving forward.) Although there are many different approaches to eudaimonia, the ancient Greek philosopher Aristotle’s understanding of it, in his *Nicomachean Ethics* (1941; henceforth, NE), is particularly influential. As a result, this entry will focus primarily on his view of eudaimonia for business and professional ethics. Placing eudaimonia at the heart of ethical inquiry reminds us that ethical behavior may flow from, and thus be indicative of, lives where persons are actualizing their potentialities in a praiseworthy manner. In other words, the realization of human interests need not be antithetical to the possibility of an ethical human life, but fundamental to it.

However, the relevance of eudaimonia to practical concerns in the modern world, especially with regard to professional roles and business careers, is a somewhat challenging matter. The nature of the responsibilities of those roles and careers is such that it can demand the pursuit of goods (in particular, money, power, status, and position) that could crowd out and/or obscure the value of broader, more fundamental, and/or ultimate human goods. Thus, some question whether the modern managerial and relatively capitalist society, where organizations are bureaucratized and competitive forces can pit agents in society against each other in pursuit of scarce market resources, is consistent with the possibility of persons, both as individuals and as members of communities, sharing and pursuing a common understanding of truly beneficial goods and an ultimate human good. Notwithstanding this challenge, ethicists have done significant work in outlining possible conditions under which some form of flourishing is possible in modern society, even if it is the case that disagreement remains among them.

## Eudaimonia and the Challenge of the Modern World

To understand the reason why ethicists find it challenging to import the notion of eudaimonia, in the classic, Aristotelian sense, to the modern society – especially as it may pertain to professional roles and business careers – one can look at one view of the activity of business and then compare it with Aristotelian ethics.

Many people, if not most people, deem that the decision to enter into a career in business is driven by a desire to make money and become wealthy. And though it is true that this may not be the *only* reason, a commercial entity’s survival in the market demands constant consideration of the need for revenues to outstrip expenditures. As a result of this basic reality, it is possible to understand the logic of pure profit-making business activity without any reference to the particular type of profit-making venture in which one participates; to enter into business is merely to use one’s energies and efforts to increase the financial health of oneself or of one’s firm – whatever the product or service involved. To engage in business successfully, one need only pay attention to the signals of the marketplace (especially arbitrage opportunities) to determine which activities are most conducive to the production of financial value, and then respond to them appropriately (see, for example, Kirzner 1973 for an elucidation of the logic of the pure competitive market process).

What does minimally ethical business behavior look like under these conditions? One could argue that under these basic circumstances, ethical behavior amounts primarily to adhering to rules of conduct, including, but not limited to, intentionally aiming to maximize profit by fulfilling one’s legal, customary, and professional duties; avoiding fraudulent, coercive, and opportunistic behavior that undermines the stability and/or efficiency of the market system upon which business depends (Friedman 1970); and, where necessary, engaging in conduct that actively promotes that efficiency (Heath 2014).

Some would end their inquiry there. Nevertheless, the above view of ethical behavior makes little reference to additional features of the world

in which businesses operate, or, more particularly, little explicit reference to the duties businesses may have to stakeholders in the broader social context, especially in light of the resources and privileges businesses possess (see, for example, Freeman 1984). An entire literature about the relationship between “business and society” has developed as a result of this type of problem. However, beyond the question of that relationship, a related, but even more fundamental, ethical issue remains. Namely, when one asks additional questions about the aims, reasons, and purposes of pursuing wealth – questions that highlight *how* and *why* business careers, for example, are worthy of one’s time and attention, as opposed to manifold other careers and activities – matters become more complicated.

A simple question underscores the reason: why would a person want to try to make money? Presumably, one would argue that money enables a person to do lots of things. Some examples: to have a safe and secure home for oneself and one’s family; to be able to do entertaining things, such as take vacations, enjoy outings with family and friends, and develop hobbies; to fill one’s home with nice furniture and clothing and toys that make for a privileged existence; etc. If pressed further, one could argue the reason why those things are desired is because they can make a person happy. But this answer does not seem to satisfy completely: surely, one can have a life full of diversions and comforts, and surely such diversions and comforts *may* be part of a happy life, but they may also leave a person feeling somewhat empty, unsatisfied, meaningless, and unfulfilled. (For a discussion of the value and limits of wealth for happiness, see Brooks 2008).

This last concern is indicative of motivations behind the scholarship of those working in the aforementioned Aristotelian tradition of ethics. Aristotle described the notion of an ultimate human *telos*, or supreme end or good, rooted in the very nature of what it means to be human. Once again, he identified that end as *eudaimonia*, or happiness/flourishing – an end that is chosen for its own sake, and thus requires no additional justifications (NE, Bk. I, Ch. 7). Aristotle believed that there were many beliefs about what

happiness/flourishing consisted in (NE, Bk. I, Ch. 5), but he thought that the right answer to that question would be rooted in realizing, in the fullest way possible, the most characteristic function of human existence, tethered to our natures as social/political animals. That function, which distinguishes human beings from other animals and plant life, is rational activity. However, Aristotle was not just concerned about the use of our functions, but also their *excellent*, or virtuous, exercise. After all, there are many things one can do, and there are many ways one can do them. But Aristotle was thinking about the best things one could do in the best way possible. It is in this manner that Aristotle concluded that the ultimate human end consisted in the use of one’s *rational activity* (as one’s highest, most characteristic function) *in accord with virtue* (performed excellently via praiseworthy states of character) (NE, Bk. I, Ch. 7).

In a flourishing life, one can see, by and large, actions guided by practical wisdom *and* moral virtue in the context of communities where such behavior is supported by one’s fellow human beings. (It is for this reason that *friendship* plays such a crucial role in Aristotle’s ethics [NE, Bk. VIII, Chs. 1–9]). Aristotle claimed that though one is capable of understanding knowledge and virtue as distinct, at least conceptually, they are empirically inseparable in the virtuous person (NE, Bk. VI, Ch. 13). Even if one were to have the practical know-how to achieve ends, to flourish one still needs to be disposed to engage in upright behavior in the pursuit of more immediate ends – and also to be disposed to pursue ends that are actually valuable. (NE, Bk. II, Ch. 6). The possession of praiseworthy and stable character traits (moral virtues), such as courage, temperance, fortitude, justice, magnanimity, and liberality, enables this by framing practical knowledge to orient a person appropriately. To emphasize, there are many ways one might achieve her ends efficiently, but only some ways are in accord with a morally praiseworthy character – and, as it stands, only some ends are themselves worthy of one’s attention.

Possession of the virtues is necessary for flourishing/happiness, but one misconception

must be addressed about how the virtues function vis-à-vis eudaimonia. The virtues themselves are not mere inputs into some predetermined view about flourishing; it is possession of the virtues that helps one define (under certain circumstances) the flourishing life itself. Aristotle believed that because the virtues are admirable and desirable for their own sakes, one ought to pursue the virtues for their own sakes, and not just for what they get a person. One can note, for example, that the virtuously honest and patient person is commendable just because her honest and patient behavior and character warrant admiration – not because the virtues of truthfulness and patience are mere instruments to some other end, such as gaining the trust of others (NE, Bk. I, Ch. 12). Thus, because of the way that the virtues constitute a flourishing life, it is only in pursuing their virtues for their own sakes that one can begin to understand what that flourishing means.

To make this more concrete, imagine if a person were to believe that having wealth was the equivalent of happiness and that being virtuous in pursuit of that idea of happiness would help her achieve that end. Consider two plausible scenarios that could result. The first scenario is one where, despite a supposed commitment to being honest, trustworthy, fair, etc., her overriding desire for money-as-happiness leads to behavior that converts the initially virtuous pursuits into something vicious. If money is that person's highest good, come what may, then she may find herself disregarding the virtues in favor of vices, like ruthlessness, greediness, and opportunism, that appear more effective at securing wealth. Now, it is true that she might be successful at achieving great wealth, but the price she paid was her character and the chance of true flourishing – in fact, it is quite possible that she ends up feeling unsatisfied and empty. Why? On this generally Aristotelian account, it is because she failed to pursue those virtues just for their own sakes – she turned them into instruments for the pursuit of some other end – and that end distorted and/or cannibalized those insufficiently valued virtues. Of course, it is an empirical claim that she will

probably not end up truly happy, and Aristotle was aware that many people believe it is possible to become happy pursuing wealth so zealously. But, because Aristotle believed that such a pursuit is not tied to the greatest potentialities inherent in human nature, activities based on that distorted understanding of happiness ultimately limit the full actualization of human nature.

In a second scenario, a person believes money may bring happiness, but she is more committed to being admirable and virtuous first and foremost. So she acts in ways that are honest, trustworthy, and fair, even when those virtuous behaviors get in the way of her other purported end – making money. In time, and as a result of your pursuit of the virtues, she begins to understand happiness in a new light. The pursuit and possession of those virtues changes her view of what a flourishing life looks like, and she begins to see that though money may be a valuable instrument for securing some elements of a good life, it is not what happiness hangs upon. It cannot satisfy on its own; there are more fundamental and more satisfying human goods worth desiring. Delight in noble pursuits themselves – pursuits that realize the best of human life – becomes synonymous with happiness. (To be sure, possession of some wealth can be necessary for a flourishing life, but it is never sufficient. See also Aristotle, NE, Bk. I, Ch. 8. For a modern articulation of this view, see Otteson 2019.)

Herein lies the challenge for business and professional careers, however. The modern market and managerial capitalist economy is purported to render it nearly impossible for individuals to engage in activities that foster and enhance the goods necessary for a flourishing human life. This is thought to be the case for at least three reasons: first, markets measure the success of one's activities too narrowly (in terms of the efficient production, distribution, and sale of money-making goods and services, regardless of whether those goods and services contribute to a robust and morally praiseworthy notion of human well-being); second, managerial demands (and professional roles) reduce human freedom by limiting

action in pursuit of ends dictated by external goals generated by impersonal market forces; and, third, those market forces place agents into competitive relationships where resources are pursued for individual purposes and for the sake of efficiency – often at the expense of strong human bonds. (Representative concerns are identified in Brenkert 2002; Sandel 2012.)

What features of the modern economy are thought to underlie the above reasons? Consider the following perspectives seen as necessary to succeed in business: the view of individuals in the general public primarily as potential consumers, as opposed to citizens and friends; the view of employees as mere costs for firms, lacking their own agency, as opposed to irreplaceably valuable assets who are cocreators for the firm; the view of the natural world as a vast minefield of resources to be exploited until it is exhausted, as opposed to a delicate, nurturing home for all of the created world; the view of other businesses as competitive adversaries that ought to be driven out of the market, as opposed to complementary ventures aiming to satisfy true human need; and, finally (but not exhaustively), the view that humans should engage one another primarily via reciprocal, mutually beneficial transactions, as opposed to operating under the logics of gift, love, and gratuitousness (on this last point, see, for example, Baviera, English, and Guillén 2016). A business and/or professional career, then, can potentially cripple one's character toward greed, envy, and a distorted sense of flourishing, as the modern world's institutions risk encouraging a dynamic of invidious relationships, a narrowly individualistic understanding of human persons, and a reduction of value to mere instrumentality.

### **Eudaimonia and Vocations: A Path Forward**

Despite these purported problems, many scholars have attempted to salvage the possibility of human flourishing, rooted in the virtues, in the modern world. One challenge scholars face is that today's globalized economy, characterized by very diverse and specialized work, and

dependent on vast and complicated systems of sophisticated financial, technological, and political institutions, looks very much unlike the simpler economy of Aristotle's era. Thus, the effort to adopt an ethos that was conjoined to a distinct economic, social, and political tradition requires sorting out what is central to that ethos and then adapting it to the realities of today's world. Though it is true that some, following the important work of Alasdair MacIntyre (1999), argue this is most likely impossible, others have not abandoned the call to offer a thoroughly robust account of human flourishing tied to traditional virtues. These attempts feature multiple dimensions, such as questioning the dominant assumptions of the market order to uncover the more humanistic foundations of economic activity in markets (for example, Melé 2011); attempting to unearth and promote the virtuous activity inherent in the market activity (for example, Storr and Choi 2019); highlighting and promoting the features and cultural spirit of capitalist innovation, experimentation, and discovery (for example, Phelps 2013); or, finally, underscoring that even greater moral challenges and opportunities for corruption may permeate nonmarket spheres and activities (for example, Brennan 2014).

One approach for establishing the possibility of flourishing in business careers and professional roles within the modern economy, regardless of one's views of the ethical values and disvalues of the capitalist order, calls for some attention. This approach centers on the idea of business careers and professional roles as *vocations* (for examples, see McPherson 2013 and Wolcott 2015). Vocations are traditionally understood as *callings* to live, to work, and to do certain things – things that relate to an agent's self-understanding in a robust, all-encompassing fashion. Vocations can be understood religiously or secularly – as a call from God or as a call from one's conscience (Adams 1999). An agent who believes that she has a vocation will focus her energy, attention, and time on developing the skills and traits to craft a life according to the contours of her vocation. The notion of a vocation, in fact, may help thread the needle between objective goods/realities and subjective desires/perceptions – thus accounting for

the fact that there are some standards by which all persons, in virtue of their natures as human beings, may be said to flourish, while at the same time acknowledging the fact that flourishing takes a unique form for individuals relative to their own circumstances and personalities. (For a discussion of the individualized nature of flourishing rooted in the concept of human perfection, see, for example, Rasmussen and Den Uyl 2005). That is to say: legitimate vocations entail choices, behaviors, and attitudes that are in some way tied to that which is objectively good, but the scope and shape of those phenomena will be different for different agents. And, insofar as pursuing one's vocation leads to flourishing, that pursuit must be done excellently—that is, in accord with the virtues.

Thus, the question that a business person or a professional might ask herself is this: is a career a career that responds to a call to live, to work, and to do certain things that are reflective of my personality, abilities, values, and beliefs; is it tied to objectively good outcomes; and, is it done in a virtuous/excellent way? Relatedly, what institutions, practices, and norms encourage the realization of human flourishing in a way that fosters the ability of individuals to develop their characteristic capacities and live harmoniously with their families, friends, and neighbors in thriving communities? Note, answering these questions will require a person to think both in the near- and in the long-term, with a view to consequences that are not always immediate or obvious, as it may not be clear how the pieces of the puzzle, as it were, fit together in an increasingly complex, interconnected, and global marketplace; there is simply no easy way to track the relationship between one's virtuous behavior and desired outcomes. Nonetheless, the focus on human flourishing in business and professional careers may, at the very least, prompt a person to reflect on concerns over *who she is* and *what she becomes* as more central to her pursuits than *what she gets* and *how to get more* (for a discussion of the value of “reflective rationality” over “instrumental rationality,” see Schmidt 1993). Whether there is a dispositive case that certain answers are possible to realize in the modern world may remain an open question.

## European Business Ethics Network

Alex C. Michalos  
University of Northern British Columbia, Ottawa,  
ON, Canada

### Synonyms

Business ethics organization for Europe; European organization for issues on social responsibility of business; European social responsibility of business organization; Professional business ethics organization

### Definition

This is a brief description of the mission and status of the European Business Ethics Network.

### Description

The mission of the European Business Ethics Network (EBEN), according to its website, is “to promote ethics and excellences in businesses, to increase awareness about ethical challenges in the global marketplace and to enable dialogue on the

role of business in society.” Another way to express the practical as well as theoretical interests of the EBEN is the following: “Business persons are active members of EBEN and EBEN explicitly wants to be a two way organization where academics and businesspersons constantly interact and learn from each other.”

At this writing (May 2017) there are “18 National Networks established in several countries” with “active groups in over 40 countries” creating the possibility of establishing formal connections with the central group. The current president of EBEN is Geert Demuijnck.

One of the unique features of EBEN is its description of formal procedures for “establishing a local group with connection to the larger European family.” Local groups have the opportunity to build strength in their own communities while drawing on strengths from the larger group. Briefly, the procedures say that any “national network name should include the ‘EBEN’ name,” national networks should provide a “full financial report” and a list of members, it should “facilitate and improve the dialogue between the [local] research community and the business community, and it “should have a clear European outlook.” It is unclear how the latter would be demonstrated.

Selected proceedings of EBEN’s annual conferences are published in the *Journal of Business Ethics*, and all members have “free access” to *Business Ethics: A European Review*.

## Evolution of Corporate Social Responsibility: A Historical Overview

Evolution of business ethics; The concept of social responsibility in business

### Introduction

The belief that business has a responsibility toward society has a long history that can be traced several centuries back. However, the modern concept of corporate social responsibility (CSR) is mostly a product of the second half of the twentieth century up to the present time. The purpose of this chapter is to provide a historical overview of the evolution of CSR that helps understand how the concept has changed and grown in terms of its *meaning* and *scope*. At the same time, this chapter will identify the main factors and events that have influenced the understanding of CSR. While there are traces of CSR around the world, its evolution and progress have been most evident in the United States (USA) and Europe, which is why this chapter will mostly focus in these geographical areas. Through this historical overview, it will become apparent that the understanding of CSR has evolved from a limited perspective to a global approach that reflects today's social concerns and expectations of corporate behavior.

### 1950s and 1960s: Early Days of CSR

The historical roots of CSR can be traced several centuries back. However, it was not until the twentieth century that it became a widely

acknowledged concept by scholars and business practitioners. The formal debate around the social responsibilities of corporations begun in the early 1900s when unions were organized to improve the working conditions in the new industrial society (mainly in the USA). As a result, by the 1920s and 1930s, business managers begun realizing that they had to balance their economic objectives with a stable relationship with their workers, clients, and community. Then, during World War II and the 1940s, there was significant growth in the industrialization process in the USA, and society began seeing companies as organizations with social responsibilities.

During the 1950s, scholars and practitioners began trying to define *what* were the social responsibilities of business. In these early writings, CSR was often referred to as social responsibility (SR) and the attention focused on business executives and managers rather than on the company. This period saw a changing attitude toward corporate behavior that reflected increasing concerns of the impact of business on society. Perhaps the most relevant example of the changing attitude was the publication of the *Social Responsibilities of the Businessman* by Howard R. Bowen (1953). Bowen argued that the largest corporations of the time concentrated a great amount of power and had a tangible impact on society and, as such, there was a need for businessmen to consider the wider implications of the company's operations. Not only that, but for Bowen, the decisions and actions of businessmen affected the stockholders, employees, and clients and, as a result, affected the citizens' quality of life in many ways.

With this in mind, Bowen (1953) raised several questions, one of which shaped the evolution of CSR: "What responsibilities to society may businessmen reasonably be expected to assume?" (Bowen 1953, xi). To answer this question, Bowen defined the social responsibilities of business executives as "the obligations of businessmen to pursue those policies, to make those decisions, or to follow those lines of action which are desirable in terms of the objectives and values of our society" (Bowen 1953, 6). Bowen was ahead of his time for his approach to business management and for raising questions

regarding the social responsibility of business and his book and definition marked the beginning of the modern era of CSR.

During the rest of the 1950s, the discussion mainly revolved around the moral responsibilities of corporations in a postwar era, and scholars began exploring the role of business in relation to the societal concerns of the time with a particular interest in labor conditions. This decade was a period of changing attitudes during which business executives and academics began getting more comfortable discussing the social responsibilities of corporations than in previous years. However, the business management of the time did not change beyond the engagement of some companies in philanthropic activities as a response to requests from local social and beneficiary organizations.

During the 1960s, the social momentum resulted in a growing interest in CSR which was more visible in the USA than in other countries. The social movements of the time reflected concerns around population growth, depletion of natural resources, pollution, and human and civil rights. The decade was also marked by protests about civil rights and antiwar sentiments and represented a new social context to which businesses would need to adapt. While the protests in the USA began as student-led sit-ins, walkouts, and rallies, they transformed into political activism that, in many cases, saw corporations as part of the “establishment” they wanted to change. The protests put pressure on companies with direct links to war as well as on large-scale corporations such as banks and financial institutions which, in the protestors’ view, represented the “establishment” (Waterhouse 2017).

As a result of this context, scholars began seeing CSR as a way for businesses to respond to the needs and desires of modern society. This led to a growing interest in defining and formalizing what CSR meant. One of the most significant contributions to the evolution of CSR came from Keith Davis (1960), who argued that the social context of the time required businessmen to reexamine their role in society. Davis (1960) explained that businessmen had obligations toward the society in economic terms as well as

in human values and argued that, to a certain extent, their social responsibilities could be linked to economic returns for the company. Davis became well known in the CSR literature for bringing forward the notion that the “social responsibilities of businessmen need to be commensurate with their social power” (Davis 1960, 71) and that companies that avoided their social responsibilities would see a gradual decrease in their social power.

This new approach gave way to fundamental changes in the understanding of CSR. In the following years, scholars claimed that the growing power of corporations needed to be balanced with deliberate and conscious efforts to achieve responsible behavior. Furthermore, the academic literature gave a new meaning to CSR by claiming that the responsibilities of companies should go beyond their legal and economic obligations and that they had the potential to improve the social and economic conditions of society. Notably, the new understanding of CSR acknowledged a stronger link between business and society than ever before, and the attention began shifting toward the company instead of focusing on businessmen as in previous decades.

### **The 1970s: A New Managerial Approach to CSR**

While the literature on CSR advanced during the 1960s, its implementation continued mostly in the form of philanthropic activities. Nonetheless, the social movements, protests, and environmental and antiwar campaigns of the time created additional pressure on firms and showed that society had expectations of corporate behavior that were not being met. The low level of confidence in business reached a significant point in 1969 when there was a major oil spill on the coast of Santa Barbara, California, in the USA. The accident transpired in country-wide protests in the following months and eventually led to the first Earth Day celebrated on April 22, 1970. More than 20 million people joined the protests across the USA during Earth Day to demand systemic

changes with a particular interest in ending the ongoing pollution caused by corporations.

The social momentum of the late 1960s and early 1970s played a significant role in shaping the political agenda of the USA and gave way to a new set of legislations and regulations as well as the creation of new governmental bodies such as the Environmental Protection Agency (EPA), the Consumer Product Safety Commission (CPSC), and the Occupational Safety and Health Administration (OSHA) (Carroll 2015). These changes in the political system of the USA addressed the social concerns of the time and, to a certain extent, formalized the responsibilities of business based on the expectations of corporate behavior.

The social context of the time gave CSR a new level of relevance that was evidenced through two publications by the Committee for Economic Development (1970, 1971) (CED) of the USA: *New Rationale for Corporate Social Policy* (1970) and the *Social Responsibilities of Business Corporations* (1971). These publications were based on the belief that the social contract between business and society was experiencing fundamental changes. In particular, the CED explained that “Business is being asked to assume broader responsibilities to society than ever before and to serve a wider range of human values. Business enterprises, in effect, are being asked to contribute more to the quality of American life than just supplying quantities of goods and services. Inasmuch as business exists to serve society, its future will depend on the quality of management’s response to the changing expectations of the public” (Committee for Economic Development 1971, 16).

The publications by the CED reflected a new rationale for CSR that saw business as organizations with a social impact and not only as individual businessmen with a limited influence on society. Furthermore, the CED gave a new meaning and scope to CSR by acknowledging that “business functions by public consent, and its basic purpose is to serve constructively the needs of society – to the satisfaction of society” (Committee for Economic Development 1971, 11). This meant that companies were now expected to be managed in a way that served society’s needs, desires, and concerns.

A new approach to business management and CSR began appearing during the rest of the decade. This was evident with new companies that began formalizing and integrating policies that addressed the social concerns of the time. Two of the most famous examples are the creation of the Body Shop in the United Kingdom (UK) in 1976 and Ben & Jerry’s in the USA in 1978. These companies became pioneers with a new way of doing business by integrating a broader set of social responsibilities into their activities and brought forward a new era of CSR that revolved around its practical use in management.

During the rest of the 1970s, the term *corporate social responsibility* became increasingly popular and was used to such an extent and under such a variety of contexts that its meaning became unclear and, as a result, CSR meant different things for each person. For some scholars, companies were not responsible for improving the conditions of society or addressing social problems, and their responsibilities had clear boundaries that extended only to the direct impact of their operations. For others, corporate behavior needed to be coherent with the social values and expectations of the time, and hence, CSR should be prescriptive.

The unrestricted use of the term CSR resulted in uncertainty regarding its meaning, and it was not until 1979 that Archie Carroll proposed a new definition to give it a clear and concise understanding that could be applicable under any context: “The social responsibility of business encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time” (Carroll 1979, 500). Notably, for Carroll, CSR meant that the economic and social responsibilities of a company should be understood as an integral part of the business framework and not as incompatible trade-offs.

## 1980s: Expansion and Operationalization of CSR

In contrast to the previous decade, the 1980s saw a new wave of politics led by Ronald Reagan (USA) and Margaret Thatcher (UK) who aimed

at relaxing the regulations and taxes to the private sector. However, while governments significantly reduced their intervention in corporate behavior, different interest groups still expected companies to fulfill their social responsibilities (e.g., groups of clients, employees, and social organizations). This was complemented with growing international attention on environmental protection along with concerns of questionable practices of multinational corporations about human and labor rights, environmental pollution, and consumer abuse. As a result, scholars began looking into business ethics and the operationalization of CSR to help managers respond to the expectations of different interest groups such as shareholders, consumers, and employees, which eventually led to the use of the term *stakeholders*.<sup>1</sup>

In the search for operationalizing CSR, scholars begun defining it as a decision-making process. This translated into the creation of frameworks and methods aimed at evaluating a company's CSR and its links to aspects such as profitability, financial performance, and market position. For the first time, and only to a certain extent, CSR was understood as something tangible and measurable.

## 1990s: Globalization of CSR

The 1990s were marked by the adoption of international conventions, international declarations, and clarifying documents<sup>2</sup> that focused on sustainability, and, as a result, this decade changed the perspective on corporate behavior and CSR in

a significant manner. The international attention on sustainable development in combination with the ongoing globalization process made CSR gain international attention. Multinational corporations that were expanding their operations to new markets with different regulatory frameworks and different social and cultural environments began exploring the benefits of CSR. Many of them began using it as a framework that could help balance the opportunities and challenges of their global business which in turn led to the rapid expansion of CSR across the world. Given this context, scholars began exploring the *strategic* implementation of CSR to find if it could lead to identifiable and measurable outcomes that could result in long-term *value creation* for the firm (mainly focused on economic returns).

The globalization of CSR made it a widely acknowledged concept by academics and practitioners alike. Business associations were created to gather companies compromised with the basic principles of CSR, and governmental bodies were formed to define those principles and encourage CSR implementation. Notably, the European Commission (EC) was one of the first governmental bodies outside the USA to promote CSR and did so with the launch of the European Business Network for Social Cohesion in 1996 (renamed CSR Europe in 2000).

While CSR expanded globally, its definition did not evolve as much. The debate around responsible corporate behavior gave way to alternative concepts such as corporate citizenship, corporate social performance, and stakeholder theory. However, most of these emerging concepts were built on the fundamental principles of CSR, and most of them were compatible and consistent with it. Nonetheless, the introduction of alternative concepts created uncertainty regarding the meaning, boundaries, and legitimacy of CSR, and by the end of the 1990s, it did not have a globally accepted definition.

## 2000s: Global Recognition of CSR

CSR gained global recognition during the 2000s as a result of international efforts focused on improving the environmental and social impact

<sup>1</sup> During the 1980s, scholars developed a new approach to business management called "stakeholder theory." This new theory focused on identifying the most relevant stakeholders of a company which would help managers make decisions based on the needs of the stakeholders. One of the most acknowledged authors in this field is R. Edward Freeman, who has written extensively on the topic (see Freeman 1984).

<sup>2</sup> Some of the most significant international conventions, international declarations, and clarifying documents of the 1990s include the Rio Declaration on Environment and Development, the adoption of Agenda 21, the Convention on Biological Diversity, the creation of the United Nations Framework Convention on Climate Change (UNFCCC), and the adoption of the Kyoto Protocol.

of the private sector. This decade represented a new era of CSR that began in 1999 when Kofi Annan, Secretary-General of the United Nations (UN), proposed the creation of an international instrument that could help fill in the governance gaps of the global markets concerning human rights and environmental and social concerns. This led to the launch of the United Nations Global Compact (UNGC) in July 2000, which included ten principles to guide the corporate behavior of its member companies. Notably, the ten principles were divided in four categories: human rights, labor rights, environment, and anti-corruption.

The international recognition of CSR was also influenced by the creation of the “European Strategy for CSR” in 2002, followed by the launch of the “European Roadmap for Businesses – Towards a Competitive and Sustainable Enterprise” in 2005. These events reflected a unified understanding and vision of CSR and outlined the European objectives for its promotion as a framework for responsible business. The international acknowledgment of CSR was also evident with the creation of the “ISO 26000 – Social Responsibility” from the International Organization for Standardization (ISO). While the ISO 26000 was approved in 2010, its development was an international effort that began in 2002 to define a guideline for business to operate in a socially responsible way.

The international recognition of CSR was also evident in the academic literature, and important contributions were made to the concept. By the early 2000s, most scholars acknowledged an implicit social contract between business and society and understood CSR as a way for companies to minimize their negative environmental and social impact. However, the growing challenges faced by corporations (e.g., increasing competition, more stringent regulatory frameworks, and more demanding customers) required CSR to broaden its scope.

Given this context, scholars began exploring the *strategic* implementation of CSR and proposed a variety of frameworks to help companies address their objectives while creating value for society. This meant that by the end of the decade,

CSR was understood as a holistic business framework that could be used in a strategic way to create a competitive advantage, generate value for society, and minimize the environmental and social impact of the company.

## 2010s: CSR and the Sustainable Development Goals

The notion of generating value for society was further developed during the 2010s and became an integral part of CSR. This new approach was based on a new social context in which companies are expected not only to minimize their impact but to improve the social and environmental conditions in the communities where they operate. As a result, CSR was now seen as a strategic framework with the objective creating value for society.

The new CSR thinking was further reinforced with the Paris Agreement and the launch of the Sustainable Development Goals (SDGs) in 2015. While these events are not directly linked to CSR, they reflect a new social contract in which companies are expected to play a significant role in addressing climate change and helping achieve the SDGs. Since then, the debate around CSR has mostly focused on its implementation and the way it can help improve specific areas of performance, while its understanding has remained on its potential to create value for society.

## Existentialism and Business Ethics

## Introduction

Vesey and Foulkes (1990) describe existentialism as “a philosophical tendency that stresses man in his total setting in the world as the fundamental starting point of philosophic reflection... it is opposed to lines of abstract philosophising” (p. 108). It is a philosophical perspective that requires individuals to link reason with practice and make decisions for which they take full responsibility. When considering the significant damage caused by certain business practices to our society and the world we live in, we realize

that both business practices and the content of teaching in business schools are in need of changes. Existentialism provides a path to the required changes. It insists that individuals recognize they have freedom to choose as they proceed through life. It requires that the status quo is challenged. Embracing existentialism in order to make ethical decisions in life generally, and in business in particular, presupposes the adoption of three axioms:

1. Decision-makers always have options available to them and must acknowledge this (in other words, there is no such thing as “I had no choice”).
2. To make progress, decision-makers must choose which options to pursue, and pursue them.
3. Decision-makers must accept responsibility for the results of the decisions they make and the actions they take.

These axioms provide decision-makers with the freedom to recognize they are not bound by intellectual “chains.” They are free agents, able to challenge what “is,” innovate, and develop fresh beliefs.

## The History of Existentialism

The Danish philosopher Søren Kierkegaard (1813–1855) is generally credited with the creation of existentialism. “Kierkegaard dedicated his life to trying to understand himself, what he believed in, and why. The central psychological endeavour of Kierkegaard may be summed up under the heading of the question he pursued relentlessly: How can you become an individual” (Houe 2011, p. 230). Other early, famous writers who have been linked with existentialism are Fyodor Dostoevsky (1821–1881) and Franz Kafka (1883–1924). In the twentieth century, the French philosopher Jean-Paul Sartre (1905–1980) was perhaps its most renowned advocate. Sartre explained: “Man is condemned to be free; because once thrown into the world, he is responsible for everything he does.”

Kierkegaard rejected the beliefs of the societal leaders of his time and of those who managed the Christian worship, although he remained a devoted Christian for all of his life. Existentialists are critical of those who attempt to tell them what they should be thinking, what is important, and how they should be behaving. Every existentialist must determine these things for themselves. Kierkegaard believed that people could be persuaded what they should think and how they should behave if they did not take the trouble to determine these things for themselves. This outcome might not trouble many members of society, but in adopting wholesale the “wishes of society,” Kierkegaard feared that he would “lose” himself. Existentialism evolved because Kierkegaard was determined never to lose himself. According to existentialist thought, in today’s complicated world, it is important that thinking individuals trouble to determine what they should be thinking about, what they should be challenging in today’s society, and what actions they must pursue. If people neglect this duty, our planet, and the human race, may be heading for perdition.

Managers are often persuaded to justify their decisions made in business, on the grounds that they should maximize short-term profitability. They are not encouraged to observe, for example, when their decisions result in rivers being polluted, air being contaminated, people working in sweatshops, employees being in danger, etc. Existentialism requires that individuals trouble to view life broadly, to remain free from economic hegemony. Existentialists must be true to their own inner values, which cannot be dictated by others in society. Every existentialist must retain the right to choose, and use, their own values for decision-making purposes.

Existentialism does not provide its users with a set of rules and regulations to help them make decisions. Rather it provides them with an approach to decision-making which requires them to retain the choice to determine completely for themselves, from first principles, what they deem the correct answer to be – although they will probably not determine this before they have chosen to discuss with others what that best answer might be and why. Existentialists use

reason in practice; therefore, as decision-makers, they must develop and own a system of values and beliefs that enable them to judge what the correct decisions will be. This requires them to think about the meaning of their existence, what they are on earth to achieve. It is not an easy task but it is an essential one.

## The Role of Existentialism

Existentialists are keen to ask “why?” questions of managers. However, many educationalists appear keen to instruct managers about “how” they should behave in order to minimize costs and maximize profitability, no matter what collateral damage is caused.

In modern society, individuals are sometimes under pressure to deny their own value systems in deference to an instrumental rationality promoted by the rich and powerful, who are keen to maintain their economic wealth. Education is used to socialize individuals, to fit them into society, and to have them accept the status quo. Existentialism requires individuals to question their world and why it is organized as it is and to find their own true selves. That is to recognize what it is “right” to strive for, to challenge that which is “wrong,” and to be convinced that they have the responsibility to choose what is “right” rather than learning this by obeying some system derived from the instrumental rationality of others. Existentialism is likely to cause tension in society as it advocates struggling to challenge that which is wrong and the promotion of that which is right. This fuels dissent in the short term, but it may prevent humankind from descending into an uncertain future while not appreciating properly where instrumental decision-making practices are taking it. Examination of many United Nations (UN) reports, for example, “The Millennium Report (2005),” provides evidence for the perils which society is facing because of the poor business practices that have been employed over the past decades.

In business we are often told to do things in a certain way, because there are no other options available. According to existentialism, this is

never the case: there are always options available. It may be that the speaker has never known the task to have been performed in an alternative manner or simply that she/he does not wish to see it performed in an alternative manner. But alternative ways of doing the task will be available. Any new person who is asked to do the job is not behaving properly if they do not think of what such options may be. Better ways of performing the task should be identified where possible, discussed with others, and perhaps adopted; unless there are reasons given as to why good options should not be trialed, they should be trialed. The originators of any idea being trialed must recognize that they have a responsibility for any problems which result. If new ways are never trialed, progress will never be made.

### Existentialism and the Purpose of Business in Society

In the context of business ethics, existentialism prompts individuals to consider the purpose of business in society. Employing “instrumental rationality,” some people believe it is possible to plan how managers should behave to obtain the best results for society from their decisions. For example, Milton Friedman (1912–2006), who won the Nobel Memorial Prize for Economics in 1976, argues that there is only one universal responsibility that business people have, namely, to maximize profits earned within the rules of the game (i.e., without breaking the law). If there are more profits generated in society, then there will be more wealth, and more members of society are likely to benefit from this (Friedman 1970).

Other thinkers, who employ value rationality, argue that Friedman’s arguments are flawed and lead to business behavior which depletes the scarce nonrenewable resources of our planet, damages the natural environment, encourages unfair distribution of wealth, and generally results in outcomes that reduce the overall value of life on earth for some.

It is easier for business managers to decide how they “should” behave, and justify their resultant behavior, if the outcomes from business decision-

making are judged against a set of predetermined instrumental objectives designed to help achieve limited ends. Over the past 50 years, many business schools have encouraged their students to focus on achieving the highest financial returns for the benefit of the suppliers of capital investments; as a result, many business decisions have been made to this end, and citizens have been asked to recognize how business activities have created wealth in society and how life for many has improved in material terms.

### The Need for Change in Society

Over the years, alongside the triumphs of business in creating profits has come a general realization that business is also creating environmental and societal problems through its operations. The United Nations has been a major critic of business in its publications of 1987, 2005, 2012, and others. These UN Reports provide evidence that the behavior of business has not been value rational in recent decades. There are problems with modern management practice and with much of what is taught in schools and universities to prepare students for it.

Many powerful members of society enjoy their power and wealth, at least in part, from the way that society has been organized and functions. For economic reasons, they are happy for society to continue to function as it does now. They argue for the preservation of the status quo. Rogers (1983) suggests, “At an unconscious or un verbalized level, there is this desire for the products of our schools to be obedient, good followers, willing to be led. Those who are independent, who think for themselves, tend to ‘rock the boat’. It is easier to manage an industry or an army with men and women who have learned to conform to the [instrumental] rules” (p. 304).

Many decisions made in the business world are justified on the basis that they result in the highest possible returns to those who provide capital to businesses. Citizens are encouraged to examine business activities through an instrumental, economic lens that justifies business success, but there is evidence that some executives who have

been “successful” in business question that success. After interviewing more than four thousand “successful” senior executives, managers, and professionals in the United States, Jan Halper (a doctoral student in 1988) concluded that many are “disillusioned by the fruits of their success, for it has often resulted in emptiness and confusion” (Pauchant 1995, p. 12). Existentialists encourage individuals to be critical of themselves and of their social heritage; this makes them free to identify better ways to judge the ethical outcomes of business decision-making.

## Fair Trade Consumerism

Equitable trade consumption; Fair trade consumption

### Introduction

A growing number of consumers are concerned with how the goods they buy are produced and how that affects the people involved in the supply chain. Those who choose fair trade goods seek to support acceptable wages, working conditions, and living conditions for workers. Consumers of fair trade are concerned that marginalized producers in developing countries are not receiving adequate prices and trade terms for their goods and workers are being denied acceptable wages, working conditions, and living conditions. Fair trade offers an equitable pricing system that involves a price floor, a fair trade price premium for community and business development, price stability, cash in advance of delivery, and support in terms of production and business practices.

Over 1.2 million farming families in 70 developing countries benefit from fair trade (“What is fair” [n.d.](#)) and more than 50,000 stores in the United States offer fair trade goods (“Frequently asked questions” [n.d.](#)).

The fair trade system results in greater equity between the developed and developing world as most fair trade producers are located in the global south. Fair trade generates partnerships between producers, wholesalers, retailers, and consumers that emphasize fairness to producers who lack the leverage to negotiate higher prices and better terms of trade.

The fair trade movement grew out of a desire to deliver a fair price and ensure improved working conditions for marginalized agricultural workers, small farmers, cooperative members, and artisans most often located in the global south and to protect them from opportunistic brokers and powerful foreign businesses. Supporters of fair trade believe that producers in the developing world are underpaid for their products in light of the end cost to consumers. Fair trade ensures that fairer proportion of the consumer's money goes to the producer of the goods they receive.

Coffee production serves as a useful example to highlight the need for a fair trade movement. Most producers have a basic education and lack access to credit, capital, or training to develop a market for their products. They operate at the whim of the market where commodity prices wax and wane. Fluctuating commodity prices put producers, workers, and communities living

on the economic margins at risk of catastrophe. This leaves them especially vulnerable to exploitation by coyotes (intermediaries) and money lenders and corrupt businesses. Fair trade certification provides access to lines of credits and markets, diminishing the role of those who might seek to exploit producers' vulnerabilities. The fair trade system of guaranteed prices injects stability into the system. Coffee is the second most highly traded commodity, which means that there are many vulnerable producers whose lives fair trade can improve.

When consumers buy fair trade products, they are buying more than the tangible goods. They also gain knowledge about the producers and their challenges and the chance to help producers meet those challenges. Some consumers see fair trade as a form of redistributive justice by giving small marginalized producers the empowerment, prices, and trading terms due to them. Fair trade consumers also frequently go beyond purchasing fair trade products, actively spreading the fair trade message by helping to create fair trade towns, universities, and schools, setting up fair trade months and fair trade festivals, and undertaking advocacy initiatives online and with print media.

Rich countries can help with the economic development of poor countries through international trade or providing aid. There is much debate among economists and development experts as to whether aid contributes to economic growth or stifles economic growth in recipient countries in the long run. Some believe that poor countries need trade opportunities and not aid. The fair trade movement aligns itself with the ideals of "trade not aid:" the principle that creating trade opportunities for marginalized producers and workers in less developed countries has superior benefits to delivering aid. But these trading opportunities must be fair and not exploitative. Fair trade maximizes these benefits by providing fair prices and a more sustainable future. The objectives of Fairtrade International standards are as follows:

1. Ensure that producers receive prices that cover their average costs of sustainable production.

2. Provide an additional Fairtrade Premium which can be invested in projects that enhance social, economic, and environmental development.
3. Enable pre-financing for producers who require it.
4. Facilitate long-term trading partnerships and enable greater producer control over the trading process.
5. Set clear core and development criteria to ensure that the conditions of production and trade of all Fairtrade-certified products are socially and economically fair and environmentally responsible ("Aims of Fairtrade" [n.d.](#)).

### Alternative Trade Organizations (ATOs)

The fair trade movement has been in existence for over half a century, but until the 1980s, it merely supplemented the work of charities operating in poor countries. Church groups from Europe and North America working in poor overseas communities brought goods home to be sold at church events and subsequently alternative trade organizations (ATOs). The well-known fair trade retailer Ten Thousand Villages provides one of the earliest examples of this in action. As their website describes:

In 1946, when [Edna Ruth] Byler traveled with her husband to Puerto Rico, she met women in La Plata Valley who were struggling to feed their children. Having lived through hard times herself during the Depression, she knew the face of poverty. She also knew the importance of dignity and people wanting a way to help themselves. Byler was moved to do something. She saw the pieces of fine embroidery the women of La Plata created, but had no place to sell. If she, an American, was so struck by these unique textiles, perhaps other Americans would also appreciate their beauty. With no clear plan but a sense of purpose, Byler brought the pieces home and began to sell to friends and neighbors. Mennonite Central Committee, an aid and relief agency, saw the long-term value that sustainable income opportunities would bring to impoverished villages. They supported Byler's endeavors and facilitated her travels abroad including to India and Jordan. . . . It was a simple idea. But a pioneering one that would launch Ten Thousand Villages and blossom into a global fair trade movement. ("The start was" [n.d.](#))

ATOs are mission-driven businesses that have adopted the fair trade approach to doing business

by addressing issues of justice and equity. These organizations bring products such as crafts, textiles, homeware, gifts, jewelry, clothing, tea, and coffee, for example, to markets such as the United States, Canada, Europe, Japan, and Australia.

ATOs have also been incorporated into the fair trade certification process. The World Fair Trade Organization (WFTO) certifies the organizations that sell fair trade products as opposed to products themselves. This made it possible to help many more producers and in particular the producers of nonagricultural products. Broadening the scope of fair trade certification is very meaningful. Lacking the fungibility of agricultural products, the problem with the monitoring and certification of crafts, textiles, clothes, and jewelry, for example, is the diversity as to who makes them and where and with which raw materials through what processes. There simply is no limit to the diversity of products to which fair trade standards might be applied, which makes it almost impossible to develop a manageable monitoring and certification system for nonagricultural products.

WFTO has been certifying organizations since 2004. At the launch of their fair trade certification system and fair trade logo, they stated:

We are on a journey. A journey for Fair Trade and Trade Justice. Not justice for the few. Justice for all. At the moment, international trade far, far too often allows the strong to exploit the weak and the rich to become richer at the expense of the poor. . . . That must change. That's why we are here! We, Fair Trade Organizations, are united in our fight against poverty and for fairer world trading rules. (Wills n.d.)

Organizations that achieve certification by the WFTO are termed FTOs and can use the WFTO logo. By providing this designation to retailers, wholesalers, and cafes committed to selling fair trade products, WFTO alleviates the need to fair trade certify each product sold, which allows artisans previously denied access to the fair trade market to gain the benefits agricultural producers have received. FTOs take an active role in verifying production methods to ensure the appropriateness of selling particular products using the fair trade label. In order to use the WFTO logo, organizations must adhere to a list of ten fair trade principles laid out on the organization's website:

1. Creating opportunities for economically disadvantaged producers: Poverty reduction through trade forms a key part of the organization's aims.
2. Transparency and accountability: The organization is transparent in its management and commercial relations.
3. Fair trading practices: The organization trades with concern for the social, economic, and environmental well-being of marginalized small producers and do not maximize profit at their expense.
4. Payment of a fair price: A fair price is one that has been mutually agreed by all through dialogue and participation, which provides fair pay to the producers and can also be sustained by the market.
5. Ensuring no child labor and forced labor: The organization adheres to the UN Convention on the Rights of the Child and national/local law on the employment of children. The organization ensures that there is no forced labor in its workforce and/or members or homeworkers.
6. Commitment to nondiscrimination, gender equity and women's economic empowerment, and freedom of association: The organization does not discriminate in hiring, remuneration, access to training, promotion, termination, or retirement based on race, caste, national origin, religion, disability, gender, sexual orientation, union membership, political affiliation, HIV/AIDS status, or age.
7. Ensuring good working conditions: The organization provides a safe and healthy working environment for employees and/or members.
8. Providing capacity building: The organization seeks to increase positive developmental impacts for small, marginalized producers through fair trade.
9. Promoting fair trade: The organization raises awareness of the aim of fair trade and of the need for greater justice in world trade through fair trade.
10. Respect for the environment: Organizations which produce fair trade products maximize the use of raw materials from sustainably managed sources, reduce energy consumption, and

minimize the impact of their waste stream on the environment (“10 principles of” 2013).

For the first three decades of the fair trade designation, ATOS provided much of the distribution opportunity for fair trade. Fair trade product certification removed barriers to broader distribution in multiple outlets in 1988 with the launch of the Max Havelaar fair trade label in Holland. The *Trans Fair* and the *Fairtrade Mark* labels were also introduced across Europe, the United States, Canada, and Japan and in the United Kingdom and Ireland. These fair trade labels and many that came after amalgamated into Fairtrade International (previously FLO) in 1997. As a result of these changes, stores without a social justice mission and online outlets sell a significant amount of fair trade products.

Certification bodies have never been a party to the fair trade exchange. They allow producers to carry a fair trade label and to receive the producer benefits associated with fair trade by enforcing minimum standards. Fair trade product certification provides consumers with important information about production practices and producers’ lives and working conditions for all involved. Certification has also fed demand; as the logos appear on more and more available goods, consumers have increasingly demanded goods with this certification.

When choosing producers and products with which to work, fair trade certification bodies consider demand, benefits that can be transferred to the producers, certification costs, sufficient supply (scale), and the environmental and social conditions surrounding production. Globally, the fair trade certification network certifies coffee, tea, herbs, cocoa, fresh fruit, vegetables, sugar, beans, grains, flowers, nuts, oils, butters, honey, spices, wine, crafts, and apparel. In the case of Fairtrade International monitoring and certification, in return for the benefits, producers must adhere to a code of conduct the certification authority set that include:

1. *Social development*: Training opportunities, nondiscriminatory employment practices, no child labor, no forced labor, access to collective

bargaining processes and freedom of association of the workforce, condition of employment exceeding legal minimum requirements, adequate occupational safety and health conditions, and sufficient facilities for the workforce to manage the Fairtrade Premium.

2. *Economic development*: Minimum price aims to help producers cover the costs of sustainable production. The Fairtrade Premium is money for the producers or for the workers on a plantation to invest in improving the quality of their lives; improve the situation of workers, farmers, and local communities in health, education, environment, economy, etc.; standards require buyers to give a financial advance on contracts, called pre-financing, if producers ask for it.
3. *Environmental development*: Minimized and safe use of agrochemicals, proper and safe management of waste, maintenance of soil fertility and water resources, and no use of genetically modified organisms. Fair trade standards do not require organic certification as part of its requirements. However, organic production is promoted and is rewarded by higher Fairtrade Minimum Prices for organically grown products.
4. *Forced labor and child labor*: Forced labor and child labor are prohibited in the Fairtrade standards (“Aims of Fairtrade” n.d.).

In addition to certifying products that are 100% fair trade (coffee, sugar, flowers), Fairtrade International also certifies goods in which some key ingredients are fair trade.

## Changing Standards

Over time the producers who can apply for certification for fair trade certification through the licensing bodies have become more diverse. When subsumed under the Fairtrade International umbrella, Fair Trade USA used Fairtrade International, but it broke ranks with Fairtrade International in 2011. Thus the main players in the fair trade certification movement now have different approaches to setting standards. Specifically,

Fairtrade International focuses on helping small farmer cooperatives and workers. Fair Trade USA certifies similar entities but also certifies products produced by large businesses and plantations, which Fairtrade International excludes. This schism in the fair trade movement reflects an existing disagreement regarding how to grow the movement and for whom fair trade certification should be made possible.

## Fast Growth Private Firms: The Power of Ethical Values and Trust in Enhancing Performance

Peggy Cunningham  
Dalhousie University, Halifax, NS, Canada

## Synonyms

Ethical organizations; Values-led organizations

## Introduction

Even though private firms make up a significant portion of the economy in North America, they have been largely neglected in both the public press and academic literature. Over 99% of the businesses in North America are private firms, and they account for nearly 59% of sales and nearly 49% of aggregate pretax profits (Biery 2013). To better understand private firms, two research questions were posed: (1) Why are some private firms highly successful in terms of increasing their revenues, profits, number of employees, and markets? (2) Are there common characteristics among the successful firms that differentiate them from their less successful peers? One of the unexpected findings arising from the study was that the most successful private firms were values-led. Deeply embedding ethical values into all the firm's operations served to engage, motivate, and retain employees. These employees, in turn, provided superior service and innovative products to a clearly defined set of customers in a differentiated niche marketplace. Values were also used to guide and sometimes control growth and market entry (Cunningham 2019). While there is an extensive literature related to firm performance, no prior studies could be found that linked being led by a specific set of ethical values with superior performance and growth.

## Background

Following the pioneering work of Birch 1989, fast-growth companies have been titled "gazelles" – those firms who have achieved a growth rate of 20% or more over a time period of at least three consecutive years. Little work has been done to find generalizations that characterize rapidly growing private firms. What has been uncovered represents a fragmented body of work with little overarching theory that can be used to unite the diverse findings that arose in previous studies (Gabrielsson et al. 2011). Typical explanatory variables for rapid growth that have arisen out of the extant research include founder characteristics, ownership type, firm size and age, strategic orientation, market environment, partnership

development, customer orientation, innovation and new product development, and human resource practices.

While many firms publicly display their values, few authentically live those values in all they do. In contrast, values-led companies are those that have a deeply embedded set of values that are “lived” on a daily basis and impact all of the firm’s planning and operations. The concept of values-led companies appears to have originated with Ben and Jerry’s Ice Cream in the late 1990s. The founders used the term values-led business to describe the firm and wrote a book about how to run and profit from a values-led business (Cohen and Greenfield 1998). To date, most of the literature on values-led companies seems to be in the popular press rather than in the academic literature. However, there is an emerging body of literature related to the concept of values-led business that falls under various terminologies including B-corporations, conscious capitalism, corporate citizenship, social impact company, ethical business, purpose-driven business, social enterprise, and socially responsible business.

## Methodology

Given the limited literature and the equivocal findings from previous studies, secondary data and a field-based approach (in-depth interviews) were used. Applications of 40 companies who entered a competition for a private business growth award comprised the secondary data. To qualify as a private, fast-growth company, the firms had to meet several criteria: revenues in excess of \$five million annually and a record of significant growth. The firms had to demonstrate growth in four areas: revenues, profits, number of employees, and number of markets served, over a 5-year period. All 40 firms came from a wide variety of industries ranging from brewing to food production, finance to pharmaceuticals, high tech to traditional manufacturing. Firms ranked by judges as the top performing firms were compared to firms ranked in the bottom quartile.

In addition, 20 in-depth interviews were undertaken with senior managers (e.g., the owner, CEO, CFO, or senior executive team members) of the top organizations. The interviews were conducted with the purpose of uncovering common factors that characterized rapid-growth private companies. The author analyzed the data systematically using standard qualitative data analytic methods (Strauss 1990).

## Findings

All private firms in the study demonstrated the ability to innovate, grow their revenues and profits (some by exceptional amounts up to 300% per year), and expand their workforces and marketplaces. What was particularly striking, however, was that the majority of the top 20 firms (75%) wrote about and talked about their values as one of the primary factors accounting for their success. For example, one co-owner of a firm described himself as being the “culture communicator” who constantly stressed and kept alive the values that he believed led to his firm’s success. The non-winners rarely put such a focus on values (less than 20%), and if values were mentioned, they did not appear to be as central to their customer strategy, culture, or operations. The most common values used by the top fast-growth companies are outlined in the following sections.

### Value of Care

One of the CEOs of a fast-growth, private firm described this value as follows:

XXXX (company name) is more than just a place to come to work; it’s a family. We look after each other.

Senior executives of the highest performing private firms spoke of their firms as organizations where people care deeply for each other. What the firms described as their most commonly shared and primary value appears much like the normative ethical theory articulated by Carol Gilligan (1982), who focused on the female values of empathy and compassion versus the values of justice and abstract duties used by men. While

the values are reflective of Gilligan's work, it has to be stressed that most of the founders and CEOs of the most successful fast-growth, private firms were men.

The caring took place not only in the workplace but when employees were experiencing personal challenges outside of work, like having a sick relative. Employees were given time off, if needed, above and beyond their holiday periods. Others were granted loans to help overcome a challenge like a house fire. One firm consciously limited its production and the number of orders it accepted so as not to cause its workforce undue stress due to overwork or demanding delivery schedules. In this fashion, the fast-growth firms strove to achieve emotional and physical well-being among their employees that has been demonstrated to be so important in today's fast-paced, high-stress world (see Schaufeli and Salanova 2007). The fast-growth firms also went to great lengths to preserve their cultures and the value of care that was so central to their culture as they grew.

As another aspect of care, founders, owners, and senior executives in the fast-growth firms also spoke of their desire to create conditions at work that allowed their employees to reach their full potential. All of the firms had exceptional programs enabling their employees to further their education or skills development. As one of the private, fast-growth firms noted:

It's through this focus on achieving goals that we identify optimal training and development programs to grow all of our employees to reach our desired results.

In many of the firms, employees were cross-trained so that they fully understood how the various functions in the firm created value for the firm's clients.

The fast-growth firms also exhibited the value of care toward the communities in which they operated. One owner noted that one of his main reasons for purchasing his firm was to prevent it from shutting down and removing many jobs from the small community in which it was located. Others spoke of their determination to remain in the community in which the business

was founded even though moving to a new location might have lowered costs or improved access to important inputs. The fast-growth firms also stressed good citizenship and supported many charitable initiatives in their home communities and in other communities in which they operated.

### **Customer Obsession**

The fastest growing companies were universally customer obsessed. As an illustration, one traditional manufacturing firm refused to describe itself in terms of the products it manufactured. Instead, its owner stressed that his firm was a "customer service firm." Putting the customer first and deeply understanding customers is a well-established performance indicator arising from many marketing studies and theories like market orientation (see Slater and Narver 1995). Without exception, the fast-growth firms worked to deeply understand their customer's needs and provide them with exceptional products and services to satisfy their needs. Most of the fast-growth firms (90%) worked in B2B marketplaces using focused differentiation strategies. They had high market cognition and deep customer knowledge that was utilized to outperform their competitors.

### **Honesty, Fairness, Transparency, and Integrity**

Operating using ethical values was central to the most successful fast-growth companies. The owners and founders talked of the need for integrity and honesty in all their dealings and in their communications both internally and externally. One owner featured the following value statement on his business cards and all the company's correspondence:

Integrity will be evidenced in my character and action, and I will not tolerate among us anyone who does not adhere to these values of honesty, uprightness, soundness, and wholeness.

Fairness was stressed and enacted through promotion from within, and it served as a hallmark of many (80%) of the successful fast-growth private companies. Given this, being open, fair, and transparent were essential elements of these firms.

Senior executives at the fast-growth firms went to great lengths to communicate these values to the firm's employees, and they did this personally whenever possible. Their consistent honesty and integrity in both their communications and actions built high levels of trust among both their employees and their clients. For example, some of the firms shared their financial statements with their employees so that they could see and understand how their efforts contributed to the firm's success. This not only led to greater trust in management but also improved employees' productivity and their desire to deliver customer value. Treating customers fairly and with integrity helped the top private firms build strong lasting relationships with their buyers. The relationships were often so strong and trusting that data was freely shared between them. This, in turn, led to a deep understanding of each other's businesses and the challenges and opportunities they faced. The highest performing firms had such strong relationships with their clients that collaborative innovation projects were the norm in these companies. The top fast-growth firms worked closely with their clients to develop new products, processes, and services. Clients (and firms with similar problems to solve) readily adopted the innovations reducing the firms' market risk.

### **Respect for Diversity**

The majority (60%) of the top fast-growth, private firms had diverse workforces, and they strove to ensure that each and every employee felt appreciated for the value they brought to the firm. When asked to give the reasons why their firms were so successful, the CEOs stated that it was their employees who created success for the enterprise. Employees were encouraged to express their opinions and were given the independence to solve problems for the firm and its clients. Having a diverse workforce was especially important when it came to expanding the firm's markets to a diverse set of overseas locations. In addition, many of the firms used in-bound marketing receiving queries and orders from firms located from around the world. Having people within the firm who spoke one or more languages and who knew the culture dominating various overseas

markets and the norms and business practices of new geographic markets boosted the firms' ability to enter new markets and serve them successfully.

### **Collaboration**

The most successful fast-growth private firms valued collaboration far more than their less successful counterparts. Internally, many noted that individual success depended on other's successes. The following quote is illustrative of this thinking:

People at XXXX [company name] are friendly, inclusive, approachable, and dedicated to serving not just their customers, but one another. Its culture can be summed up in a short phrase: How can I help you? Just as XXXX strives to build strong communities among its investors, tenants and suppliers, it encourages cohesion and community among its staff.

The most successful fast-growth companies focused on team success more than individual merit and based their reward and bonus structure on team or group success. Not only did they encourage collaboration among employees, they collaborated with others in their supply and delivery chains. As noted earlier, they collaboratively undertook R&D which led to new product development which both lowered costs and improved the success of their new products.

### **Focus on Sustainability**

The highly successful firms had significant environmental sustainability programs at a level far above their less successful counterparts. Many began their efforts to make their products and production methods more sustainable ahead of their competitors in the industry. This often gave them a point of distinction and a first mover advantage. They focused not only on environmental sustainability but on the sustainability of growth being careful not to overly stress their employees, capabilities, or financial resources. Rather than relying on outside financing to support growth, the most successful fast-growth firms grew organically, using self-generated funds (profits) that were reinvested into improvements and growth rather than venture capital. This ensured ongoing control of the firm and helped to maintain the values and culture.

## Conclusions and Directions for Future Research

This is one of the few studies on private firm performance and one of the few to link being values-led with high performance in terms of rapidly growing revenues, profits, number of employees, and number of markets served. It adds to the literature that has worked to make a business case for having ethical values and programs aimed at social and environmental responsibility. The study suggests that adherence to a specific set of values was fundamental to exceptional growth and that adherence to these values contributed to other conditions enabling success. Caring for employees gave them a sense of safety and empowerment. It increased the trust employees had in management and their loyalty to the company. Such employees were free to innovate and solve problems both for their firm and for its customers. The strong link between being values-led and instilling employee trust and commitment (Cunningham 2018) suggests that a similar theoretical relationship can be used to explain these findings as did the work by Morgan and Hunt (1994), who explained customer trust and commitment in their seminar paper describing the trust-commitment model of marketing.

Customer obsession and collaboration lead to a greater ability to serve the marketplace and enabled collaborative innovation. The top private fast-growth companies had very low levels of turnover; thus, their investments in employee training and development paid off handsomely over the long term. Being cross-trained and deeply knowledgeable about the company's operations made for strong sales and marketing capabilities among a wider set of employees than would be the norm. Respect for diversity not only allowed employees to better understand the value they created for the firm and its customers but also enabled successful market expansion. In these ways, values translated into high performance and rapid growth. These findings should prove useful for managers wishing to improve the performance of their firms, small or large, private or public.

Since little research has been conducted on private firms, this area is ripe for further

investigation. While qualitative research was useful in suggesting the relationships noted in this paper, other methods should be brought to bear on questions of private firm performance to help validate and extend these preliminary findings. A set of relationships has been suggested between firms' values and other performance-related variables (e.g., employee commitment, innovation). Modelling and using quantitative methods to test these relationships using a larger sample size would be a fertile ground for a future research project. This study was conducted in a single country (Canada). Studies in different geographies with different cultures would provide a test of how generalizable these findings are across countries. Other values may also be conducive to superior performance, and research needs to be conducted to uncover these values.

Gender and Values-Direction of Boards

## Introduction

Recent global and regional corporate governance trends are once again turning the spotlight onto corporate boards. Corporate purpose, which is drawing increasing attention particularly in the European Union (EU), is one of those trends that puts pressure on boards to take immediate action in shifting from traditional shareholder primacy to stakeholder considerations (Russel and Reynolds Associates 2020). In August 2019, 181 out of 188 member Chief Executive Officers (CEOs) of the US Business Roundtable signed an amended Statement on the Purpose of a

Corporation, putting aside the traditional view that maximizing shareholder returns is the top priority. This was followed by a December announcement from the World Economic Forum updating their 2020 Davos Manifesto (last published in 1973) (Schwab 2020), challenging companies to put stakeholders at the heart of a company's purpose. Additionally, an increasing number of institutional investors have started to look for indices to discover whether a shift from shareholder primacy is taking place at firms they consider investing in. To this end, the S&P 500 ESG (Environment, Social, Governance) Index and yearly reports have been introduced (S&P Global 2020) to assess companies' ESG performance on a yearly basis (Stedman and Perrone 2019). Gaining investors' trust that a stakeholder mindset is adopted during decision-making and, thus, will soon reflect on ESG measures and reports may not be an easy task for boards, simply because boards are mainly comprised of independent directors who are appointed for their loyalty to the shareholder primacy. Additionally, independent directors, who share similar backgrounds and professional experience, are unlikely to provide diversity in perspectives, experience, or values that would consider not only the economic but also the environmental and social impact of strategic decisions. This chapter reflects on this important corporate issue and, as a solution, suggests that the appointment of women directors could bring the stakeholder mindset to board decision-making. However, only when women directors can be influential in male-dominated boards will this transition really begin. Relatedly, the argument in this chapter is enriched by discussing whether and how a female chair can play the role of a transition agent and, hence, strengthen an early signal to the investors that the transition from shareholder primacy to stakeholder considerations is taking place.

## Moving Away from Shareholder Primacy

Imagine you invest some amount of money in firm A. According to shareholder primacy, what you

should expect is for returns on your investment to be maximized at the end of the investment period. To this end, as a shareholder of firm A you want to make sure that your agent, the CEO of firm A, make decisions that set maximizing shareholder returns as a priority. How do shareholders monitor CEOs' managerial decisions as well as actions? The board of directors! This is why, for decades, boards have been seen only as monitoring mechanisms or "watch dogs," fulfilling one main role, of control. After the corporate scandals of early this century, the spotlight has been turned on boards, raising questions over their ability to successfully fulfill their fiduciary duty of control. As a solution, it was suggested that boards be independent. That is, where almost all directors are expected to be outsiders, having no affiliation with the firm or the top management team. The idea was simple: with no social relationship attached, nonexecutive directors (NEDs), who have expertise and experience in management efficiency, might better monitor managerial decisions and actions. Where boards are successful in fulfilling this monitoring role, it is expected that a repetition of the previous decades' corporate scandals would be avoided and that they would contribute to maximizing shareholders' return, which is seen as the main purpose of a firm.

In sum, according to shareholder primacy, the corporate purpose is to maximize shareholders' returns and boards are the independent control mechanisms serving this purpose. This understanding has become so powerful that corporate influentials – such as institutional investors, international organizations, nongovernmental organizations (NGOs) – have suggested board independence as best practice of corporate governance. Several national governments have imposed board independence and effective implementation of the control role as legal obligations. Education systems, theory, and research on corporate governance were no exception to this spread of ideology (Ghoshal 2005). Although academic jury continues to discuss the mixed findings on whether shareholder primacy leads to better financial outcomes, today this mindset seems to remain the dominant view in the corporate world.

However, in the last decade, role expectations of boards have started to change and this development, together with rising public sensitivity to environmental and social issues, have contributed to the expansion of the board's role. In addition to the control role, boards are expected to offer advice and counsel to top managers, and even participate in and contribute to strategic decision-making. It is interesting to note that, from recent reports on boards, strategy has become a priority for boards (McKinsey 2016). This increase in a board's role expectations can be explained by the changing circumstances in a firm's environment. Facing a rapidly changing, volatile, ambitious, and uncertain environment, corporate leaders might have recognized that boards are in fact key assets, rather than merely watchdogs, which should be utilized in the strategy process. Research has demonstrated boards' contribution to decisions in, for instance, strategic change, investment, organizational innovation, and corporate social responsibility (CSR) activities (Rao and Tilt 2016).

Why it is important to acknowledge this change in boards from being control mechanisms to strategic decision-making groups? Simply because this change has opened the way to hold boards, together with top management teams, responsible for strategic decisions that may not favor the greater number of stakeholders, or perhaps the environment and society. Accordingly, sitting at the apex of decision-making, boards have started to feel the pressure of moving away from shareholder primacy and the reconsideration of the corporate purpose. This pressure belongs to the public, scholars, journalists, activists such as Greta Thunberg, and even institutional investors (see also Canadian government's Bill C-97). What does it mean to put the stakeholder mindset at the center of corporate purpose? Laurence Fink, the chair and CEO of BlackRock and one of the signatories to the new Business Roundtable Statement, explains stakeholder primacy in practice. According to Fink, among other things, a company should consider its role in the community, its management of its environmental impact, its efforts to create a diverse workforce, its ability to adapt to technological change and take advantage

of new opportunities, its retraining programs for employees in an increasingly automated world, and its efforts to help prepare workers for retirement. But these goals are not just goals in and of themselves; they have a larger purpose (Posner 2018).

It is hardly in doubt that moving away from shareholder primacy toward the stakeholder mindset has become an important topic for boards and requires immediate actions. However, injecting a stakeholder mindset into board decision-making might not be an easy task for boards. The dominance of independent directors with a loyalty to shareholder primacy might not provide the diversity in perspectives that would reflect a stakeholder primacy. One immediate action corporate leaders might take would be the restructuring of their boardrooms by appointing new directors, particularly those who might bring along a variety in perspectives and experience as well as values that might add the stakeholder mindset to board's agenda. However, this variety might also bring along its unique challenges, which would affect board dynamics and, hence, board decision-making.

Increasing numerical representation of women directors on boards continues to be another hot topic in the corporate world. Whether to comply with the recent gender quota laws or avoid increasing pressure from business influentials, corporate leaders are appointing women directors to their boards. What is interesting is that, although unintentionally, newly appointed women directors might be an important step in bringing the stakeholder mindset into boardrooms. Next, the case for appointing women directors on boards is explained in detail.

### **Moving Away from Shareholder Primacy: Appointment of Women Directors**

Several well-known theories (behavioral theory, upper echelons theory, information processing theory) support the idea that boards make strategic decisions which are nothing but a reflection of the directors' cognitive frames. Decision makers' cognitive frames are shaped by their educational

background, functional background, professional experience, values, and beliefs. Cognitive decision-making is divided into three phases. Scanning is the phase where a director collects information about the decision/problem at hand. For example, a director with a background in finance would most likely collect information about the financial aspects of a decision/problem. Second is the interpretation phase where the information collected is harnessed with knowledge and values to generate an individual perspective on the problem. Similarly, a director with expertise in finance would create decision alternatives related to the possible financial issues of the decision/problem at hand. In the last phase, choice, decision alternatives are discussed between directors to reach a consensus on a final decision. This last phase is considered as a negotiation between different power/shareholder groups represented by directors.

Acknowledging the dominance of independent directors on boards, it will hardly be a surprise to see that board decisions reflect shareholder primacy. Board independence refers to the degree to which a board is comprised of NEDs, who are not affiliated with the firm and/or management in any way. On the surface level, increasing board independence would result in replacing executive directors with NEDs. However, at the deeper level, this change has led boards to be dominated by male directors with skills, knowledge, and experience in finance who mainly have a reputation in safeguarding shareholders' profit maximization. In this regard, while board attention would be most often directed at maximizing financial performance, other aspects which cannot be directly related to economic efficiency would be greatly neglected. This predicament is actually at the core of rising pressures against boards.

What action could boards take immediately to disentangle the fortresses of shareholder primacy? One main answer would be "change the board composition." As a matter of fact, boards might have already taken that action by appointing women directors to their boards, either voluntarily or as a legal obligation. Women directors on boards might start the transition from shareholder primacy to stakeholder primacy. Women on boards have become a worldwide topic in the

last decade. Several national governments (e.g., Norway, Spain, Italy) have adopted women quotas on boards, requiring, for example, 40% of board members to be selected from women candidates. Women directors are often different than their male counterparts in relation to educational background, functional background, professional experience, and values (Groysberg and Bell 2013). These differences generate important outcomes that might explain the rationale behind the argument that women directors might bring a stakeholder mindset to board decision-making.

Managers from marketing, sales, research, and product development backgrounds might be more often exposed to situations where stakeholder demands are in conflict. Theory and research emphasize that while a vast majority of male directors come from a business background, a vast majority of female directors come from banking, marketing, law, and public relations. Women directors are also more likely to report having strengths in marketing and sales (Hillman et al. 2002). In this regard, due to their different functional backgrounds to their male counterparts, women directors can be expected to be more open to paying attention to multiple, competing economic, environmental, and social attributes to make sense of ambiguous sustainability issues. It should be noted that instead of the key difference being their sex, it is the career path that female directors pursue in general that explains why they might be more likely to bring a stakeholder mindset to male-dominated independent boards.

Additionally, female directors might help elicit multiple viewpoints and cultivate deliberativeness in decision-making, creating an atmosphere of a stakeholder mindset in the board (Huse and Solberg 2006). Previous studies support this. Female directors are more likely to value interdependence, benevolence, and tolerance; they are more empathetic than men and thus are more likely to accept others' standpoints; and they are more likely to use a cooperative decision-making approach that results in a fair decision when competing interests are at stake (Bart and McQueen 2013).

Indeed, research shows that gender diversity increases the likelihood of firms getting involved in CSR activities (e.g., Rao and Tilt 2016). For example, some studies have found that women have stronger environmental attitudes and commitment to a green entrepreneurship program than males, suggesting that women entrepreneurs may be more engaged in green issues than male entrepreneurs. Other studies show that female directors influence different aspects of CSR, such as charitable giving, and higher levels of environmental CSR.

While changing board composition by appointing women directors can be a necessary step in moving away from shareholder primacy in board decision-making, it might not always be sufficient. It is mentioned before that in the last phase of decision-making different perspectives are discussed at board level to reach a consensus on a final decision choice. This implies that women directors' different perspectives, which most likely would reflect a stakeholder mindset, should be heard, taken seriously, and valued during board discussions. Although it may sound unrealistic, several studies emphasize that women directors face social barriers in male-dominated boards where they are perceived as unequal members of a board and categorized as tokens, as well as outgroup members (Groysberg and Bell 2013; Huse and Solberg 2006). The result is that they fail to participate and contribute to board decision-making. Therefore, appointing women directors, even with certain backgrounds and experience, is no panacea for moving away from shareholder primacy; nor will investors necessarily perceive it as a positive signal toward stakeholder primacy.

### Repositioning the Female Chair: The Agent of Transition

Compared to the USA, it is a more common governance practice in continental Europe and the UK that the CEO and chairperson positions are separated. However, recent reports suggest

that the separation of the roles of chair and CEO is increasingly seen as best practice in governance in the USA. The chairperson is the leader of the board, responsible for setting the agenda, keeping board discussions on track, and managing board meetings in such a way that each director's knowledge and experience is utilized. In this regard, an efficient chairperson can be an agent of transition. That is, an efficient chairperson may facilitate women directors' participation and contribution to board discussions. This might be achieved through setting an agenda that would reflect women directors' voice in meetings, by asking for each female director's perspective during decision-making and by working against social barriers women directors might face in the boardroom (Kakabadse et al. 2015). Research supports the idea that an efficient chairperson can influence social interactions between directors, facilitating directors' contribution to board decision-making (Kanadli et al. 2018).

This important role that would help women directors start the transition might be gender sensitive. That is, a female chair may differ from a male chair in her leadership style and reaction to social categorization processes in the boardroom. The leadership style of women directors is distinguished by their tendency to be more sympathetic, more receptive, more caring, and more cooperative (e.g., Kakabadse et al. 2015; Huse and Solberg 2006). A female chair may be more open to and supportive of a stakeholder mindset compared to a male director. Additionally, coming from a similar career path, experiencing similar difficulties while climbing to the c-suite, a female chair can be more sensitive to the social barriers women directors may face in boardrooms and, thus, be prepared to effectively handle boardroom dynamics so that female board members can be heard and be able to positively contribute to boardroom meetings. A female chair, for example, may act as a mentor to newly appointed women directors, facilitating their participation in board work as well as giving advice about how to shape social relationships in boardrooms particularly with male directors (Kakabadse et al. 2015). As a result of such sympathy for women directors and

being the leader of the board, a female chair may change the overall balance of power in favor of women directors. In turn, this may help women directors overcome the silencing effect of high power male counterparts and be influential in affecting critical decisions. Research that investigates whether and how women on boards send positive signals to investors on various initiatives supports this line of reasoning that points out the important role a female chair plays. Lucas's (2003) study hints that the visual of a female chair can relay positive information about women's fitness for board director positions, warding off gender status differences. All in all, a female chair can act as the agent of transition against shareholder primacy by facilitating women directors' contribution to board decision-making and strengthening the signal that change is on its way.

## Conclusion

Boards are no longer viewed only as control mechanisms. Boards are actively participating and contributing to strategy process and, therefore, are held responsible for a shift against shareholder primacy, which defines the corporate purpose as the maximization of shareholders' return. However, it is not an easy task. The appointment of women directors with certain backgrounds and professional experience is an immediate action to bring the stakeholder mindset to board decision-making. It is crucial to acknowledge that this transition requires an effective board leadership.

## Introduction

Feminist economics is a subdiscipline of economics that emerged in the 1980s as feminist economists started to interrogate assumptions embedded in their discipline that failed to take account of gendered roles and responsibilities and gendered social norms, particularly as they affected households and the market. As Benería et al. (2016: 56) observe, “mainstream economics defines the discipline principally in terms of optimizing the behavior of individuals.” Markets and transactions are theorized, and individual or group behavior is modeled mathematically with individuals or agents maximizing utility,<sup>1</sup> profit, or well-being subject to financial or time constraints. Attempts to understand the household and realms where prices did not hold and transactions did not involve money or assets, theorized unpaid work being exchanged for financial or in-kind support provided by individuals engaged in market labor. But as Benería et al. (2016: 56) also point out, “this approach marginalizes or obscures the importance of social provisioning, that is how societies organize the activities involved in making a living.” This is where social and cultural norms shape expectations about the gender roles individuals have and what is appropriate for their

<sup>1</sup>Utility is what economists call satisfaction. The concept of utility as it is used in microeconomics comes from Jeremy Bentham's work on happiness in the eighteenth century. <http://www.iep.utm.edu/bentham/>

time use. This includes whether women engage in paid work outside the household and have control over their earnings. Marilyn Power (2004) uses the term “social provisioning” and associates this with the emerging discipline of feminist economics. In Power’s view, there are five main components to social provisioning: “incorporation of caring and unpaid labor as fundamental economic activities; use of well-being as a measure of economic success; analysis of economic, political, and social processes and power relations; inclusion of ethical goals and values as an intrinsic part of the analysis; and interrogation of differences by class, race-ethnicity, and other factors.”

A central tenet of feminist economics is the recognition of the importance of unpaid and caring labor (Benería et al. 2016). Worldwide, the responsibility for unpaid care work falls disproportionately on women and girls, leaving them less time for education, leisure, self-care, political participation, paid work, and other economic activities. Much of unpaid work is devoted to caring for household members and household provisioning such as cooking, cleaning, washing, mending, and making clothes. Caring work takes up a significant amount of time in most countries, especially where infrastructure is poor and publicly provided services are limited or absent. Women’s responsibilities for care work can limit their engagement in market activities, reduce their productivity, increase labor market segmentation, and lead them to concentrate in low-paid, more insecure, part-time, informal, and home-based work as a means of reconciling unpaid care work and paid employment. Where social and cultural norms dictate that women bear the primary responsibility for caring, women frequently have little opportunity to shift or renegotiate these roles, limiting their agency and ability to choose other roles and responsibilities.

### **Gender as Defining Characteristic for Economic Analysis**

Feminist economics uses gender as a defining characteristic relevant for economic analysis. Gender goes beyond sex to ascribe social and cultural constructs to an individual. Gender is a social construct that is being reshaped and

reconstituted over time in different cultures and epochs (Benería et al. 2016). Gender affects the substantive freedoms that individuals have to be and do what they may wish to do, and it may even affect their imagining of what they might be and do. Gender also affects an individual’s agency, that is, the capacity of individuals to act independently and to make their own free choices (Sen 1999).

### **Agency and Empowerment**

Agency is frequently linked to empowerment and considered to be a core component of empowerment (Kabeer 1999). While various definitions exist for empowerment, a commonly accepted definition is that empowerment is an “expansion in one’s ability to make strategic<sup>2</sup> life choices in a context where this ability was previously denied to him/her” (Kabeer 2001).

Agency is defined as the ability to formulate strategic life choices and control resources and decisions that affect important life outcomes. Put more simply, it is the ability to define one’s goals and act upon them (Kabeer 1999; Sen 1999). Agency is related to one’s internal power and the meaning, motivation, and purpose that people bring to an activity. Important to exercising and having agency is having an understanding of one’s values, as well as having self-esteem, confidence, and aspirations. The expression of agency can include bargaining, negotiation, manipulation, resistance, and protest. It also includes intangible processes of reflection and analysis (Klugman et al. 2014).

Integral to agency is self-efficacy. Self-efficacy is the perception of your capability to get something done in a way that leads to desired outcomes (Bandura 1995). Drawing from social cognitive theory, what people think, believe, and feel in turn affect how they behave. Self-efficacy is important because unless people believe that their actions can produce results, they have little incentive to act or persevere when they face challenges.

<sup>2</sup>Strategic life choices are synonymous with important life choices that help people live the lives they want, as opposed to other choices which are those with less consequential outcomes.

Depending on how well you think you can do something (self-efficacy), your choices and actions will be affected (agency).

Agency is psychological, but resources and the institutional environment impact the development and exercise of agency (Klugman et al. 2014). Agency can be indirectly reinforced through a supportive environment and directly encouraged through psychological interventions that have people reflect on their personal values, goals, and hopes. Agency can be promoted through programs and policies that expand economic opportunities, provide young women and girls with trainings or new information and skills, promote gender-responsive social protection (including addressing unpaid care responsibilities), and increase access to quality education (Klugman et al. 2014: 47–56). The ability to undertake paid work can also increase agency and afford women income and earnings that can be used to secure their well-being, acquire new skills or enable them to change their status as dependents, and influence decisions within and beyond the household (Agarwal 1997). With agency and resources, people can make important choices in their lives and gain increased control over their lives.

Nancy Folbre (1994) highlights how identity and gender affect one's agency. She describes how the collective structures of constraint in a society affect agency through the pattern of rules, norms, assets, and preferences that position individuals within a social hierarchy according to their intersecting group identities (such as sex, age, race, caste, class) and how these rules determine the scope for agency available to them. The distinction Folbre (1994) makes between rules and norms allows us to see how norms and rules interrelate and how change can be brought about by acting in either arena. In Folbre's analysis, rules have an official status and can include laws and regulations that are enforced by an external authority. Norms tend to have a more implicit and decentralized nature and are embedded in our sense of who we are and our identities. But explicit initiatives to change rules through legislation, such as whether a woman can drive a truck or work on a construction site, or to set quotas for

women's participation in economic and political spheres, can also challenge existing social and cultural norms and begin to shift them over time. Similarly, interventions that support communication and behavioral change often act on social and cultural norms to challenge and reshape them. Folbre brings assets into her analysis of the structures of constraint because they too can affect agency. Access to productive assets such as land or housing changes opportunities to generate income and may also affect choices about what to do and be. Having control over assets has the potential to change a woman's intra-household bargaining power and the ability to negotiate outcomes that reflect her preferences (Agarwal 1997). As a result, having assets and/or income can also affect individual agency.

### Power

Central to agency and at the root of empowerment is power. Power dynamics, which are socially constructed, are implicit in all social, economic, cultural, and political relations. These social constructions often inhibit women from being able to claim or wield their own power. Power can be categorized in four areas: power to, power over, power with, and power within (Rowlands 1997). "Power to" is about creating new possibilities and controlling, determining, or influencing what happens. "Power over" is an interpersonal form of power and involves the ability to resist manipulation or exert control over another person. "Power with" refers to collective power in a group and achieving things collaboratively that the group wants as a whole. Finally, "power within" is intrapersonal power and is related to strength based on self-respect and self-acceptance. This "power within," which arises from oneself, is important to fostering self-efficacy and ensuing agency. These types of power interrelate in various ways.

Fostering women's empowerment requires a deep commitment to understanding how gendered power relations can change in different contexts and over time. This means efforts to impact women's empowerment require longer time frames, strong partnerships, and support for local

actors. Women's empowerment involves fostering an increasing ability to question, challenge, and eventually transform unfavorable power relations that are created and reinforced in the institutional environment.

### Why Does Agency and Empowerment Matter?

Agency is critical for an individual to make choices and to seek to act upon them. Without agency, an individual's autonomy is limited in what they can seek to do and be. Without agency and the power to act upon choices, individuals and groups can be subject to the power and rules of others. In its extreme form, such as slavery, imprisonment, or death, but even in lesser forms as a subjugated being, the lack of agency and empowerment compromises an individual's welfare and well-being. In relations between men and women and in the formation of families and households, communities, and nations, the prevailing norms and rules describe a system of entitlements that can privilege men over women and create entrenched social and economic inequalities (Nussbaum 2003; Sen 1999). Agency and empowerment go to the heart of substantive freedoms (Sen 1999). The failure to include agency in economic analysis allows economists to posit that observed outcomes are rational choices, maximizing utility subject to time and income constraints. This approach fails to identify how norms, rules, and the institutional environment shape choices and limit the ability to be and do. It also fails to explain some fundamental differences between markets and households. As Nancy Folbre (1994) points out, this vision of individual behavior sees individuals motivated by selfishness in markets but fails to explain why the same individuals might be altruistic in the household or indeed the community. This false dichotomy fails to conceive of markets as gendered institutions (Elson 1999) and conceive of human behavior as bearing the imprint of gender socialization. It also fails to understand that humans may not all seek to maximize utility or profits through market mechanisms but may have preference for other divisions of labor, surplus, and allocation and distribution of production (Power 2004).

### Institutional Environment

The institutional environment or "opportunity structure" (McAdam 1999) includes formal/informal laws, stereotypes, values, and norms. The institutional environment largely determines resource allocation and is the context within which people not only access resources but are offered the opportunity (or not) to exert agency. Oftentimes, despite changes in formal laws, women's freedoms can remain defined by tradition and customs that inhibit them from taking advantage of new possible choices. Gender norms are not just constructs perceived by individuals, but are very real structures and constraints that are embedded in organizational bodies and practices, economic transactions, and group identities (Gammage et al. 2016; Elson 1999).

Enhancing women's empowerment involves a shift in the institutional environment that can be supported through formal changes in laws, but also requires women themselves choosing to reject the power arrangements that disempower them. But in order for them to do so, Paulo Freire (1973) argues that women must be able to see the reality of oppression as a limiting situation that they are able to transform. He refers to this as "critical consciousness," which involves being able to also see that one is being oppressed and that there are other ways of being. By being able to imagine the possibility of choosing differently, one can move from an unquestioning perspective to a critical perspective. It's important to create and promote opportunities to enhance the ability of women to reflect so they can move to a critical perspective. Moving from reflection to action is a shift in thinking in which women, using a critical perspective, question and then overturn the existing power dynamics.

With voice, women can speak up about the oppression they face, be heard, as well as shape and share in discussions and decisions that affect them. Voice is commonly referenced to in terms of political interventions and initiatives (Hirschman 1970; Sen 1999; Klugman et al. 2014). Voice as part of the politics of representation takes on particular significance in the feminist literature on

collective action by women coming together in various organizational forms, ranging from cooperatives, political parties, social movements, women's organizations, trade unions, and so on (Bina Agarwal 2000; Petra Dannecker 2000; John Blaxall 2007).

## Resources

Resources describe the stock of assets or capabilities that facilitate functionings (Sen 1999) or action from which choices are made and can lead to new ideas of possibility (Kabeer 1994). Resources can be material, social, or human. Material resources include economic resources such as land, equipment, and finance. Human and social resources enhance the ability to exercise choice. Human resources can be one's knowledge, skills, and creativity. Social resources are made up of obligations, expectations in relationships (including related to unpaid care work), networks, and connections that are present in the different spheres of one's life. Yet coming full circle, access to resources reflects the rules, norms, and practices that prevail in certain contexts, as well as the preferences of those who have authority. It's not only important to consider if women are able to access resources but also how they access those resources, as access might also be conditional or exploitative. Resources create the potential for choice to be exercised. They are necessary but may not be sufficient for empowerment. There remains a need for individual or collective ability to recognize and utilize resources in one's own interest deploying agency.

## Feminist Ethics

### Introduction

Feminist ethics pertains to the inclusion, perspectives, experiences, and reasoning of women in theories of ethics (Derry 2002) and is primarily focused on sexual differences, relating to female perspectives and experiences, and gender theories – frequently relating to inequality and dominance over women and the place they [should] hold (Machold et al. 2008). This entry reviews the reasoning behind feminist ethics, its contradiction with justice ethics theories, and considers some strengths and weaknesses noticed in this theory.

### Feminist Ethics Versus Universalism

Feminist ethics builds on the observation that conventional moral reasoning has been based on male dominance, thus seriously disregarding the voice, presence, and perspectives of women in moral reasoning. While in general agreement with the above, Koggel (2010) places a well-considered footnote within the context of gender equality and the discussion of feminist ethics by pointing out that the feminist voice heard in regard to gender equality is oftentimes the one of “white,

middle class, heterosexual, able-bodied, western women” (p. 177). She therefore calls for awareness of the diversity that also exists between women groups when addressing concerns of this nature.

Bringing in the context of the ethics of care and Kant’s categorical imperative, Machold et. al observe that feminist ethics dives deeper in its ethical deliberations, by bringing in the notion of relationships. In order to clarify this, we should first explain the ethics of care and Kant’s categorical imperative, also known as Universalism.

The ethics of care is relational oriented: it focuses on characteristics such as sympathy, compassion, and friendship, which are all social virtues (French and Weis 2000). Derry (2005) describes the ethics of care as moral reasoning that stems from a concern for others and a longing to maintain considerate, reciprocal relationships with those affected by one’s actions. White (1999) alludes that the ethics of care is imperative to business ethics, as it endorses the quality of relationships through active listening, respect for, and being empathetic toward others. The ethics of care, in White’s (1999) explanation, advocates non-harming and may even involve self-sacrifice in order to meet important needs of others. White (1999) and Gilligan (1982) concur that women largely use a relational context when making ethical decisions, considering that each individual involved should be defined in connection to others, should be considered as having their own construct of reality different from others’, and should be treated well and with as little harm or suffering as possible, and with whom a decent relationship should be maintained. The reasoning above reveals that feminist ethics are relativist-based, as “right” and “wrong” are considered against the background of circumstances. This is in stark contrast with Kant’s categorical imperative, which disengages moral considerations from the specific individuals or circumstances involved.

Universalism is considered a deontological or duty-based approach (Weiss 2009). Immanuel Kant, a German philosopher, carried the conviction that each person should base his or her moral

philosophy on autonomy and that there should be one universal moral law which each of us should independently impose onto ourselves. Naming it “the categorical imperative,” this notion holds that every act we commit should be based on our personal principles or rules. Kant refers to these principles or rules as “maxims.” Maxims are basically the “why” behind our actions. Even if we are not always aware of our maxims, they are there to serve the goals we aim to achieve. In order to ensure that our maxims are morally sound, we should always ask ourselves if we would want them to be universal laws. In other words, would our maxim pass the test of universalizability? (Marques 2015). Within the framework of the categorical imperative, a maxim should only be considered permissible if it could become a universal law. If not, it should be dismissed (Rolf 2010). Kant’s categorical imperative was based on treating each other individual as an end and never as a means only (Johnson 2012), boiling down to the consideration that we should only do something when we felt that every other person in the universe should do the same, based on respect for that other person, regardless of who he or she is.

Because Kant’s categorical imperative does not consider any specific attributes to others involved in a moral act, it is supposed to be consistent and to a large extent resembling the Golden Rule, which recommends to treat others the way one would like to be treated. Moyaert (2010) confirms that Kant’s categorical imperative can be seen as “a further formalization of the golden rule” (p. 455).

It is, nonetheless, exactly the universalizability concept of Kant’s categorical imperative that places it in opposition to feminist ethics, because Kant’s theory is not relational but rather based on justice, while the feminist theory very much encourages relational contexts. Machold et al. (2008) opine that feminist ethics places its moral considerations beyond Kant’s categorical imperative by adding an imperative of care for the self and others in the context of relationships.

## Relational Considerations

The justification, which feminist ethics claims within its context, is that humans are relational beings and that it is insufficient to base all decisions on sheer rational considerations, while there may be circumstances that require adjustments. Feminist ethics places caring for others in relationships while considering circumstances, feelings, and emotions, toward a morally sound decision. So, while in the categorical imperative and other justice-based theories, all stakeholders should be given equal treatment, and the feminist ethic considers all stakeholders but allots more value to those with whom relationships have been established or can be established (Noddings 1984).

Simola (2015) brings moral courage into the equation, affirming that both, care, and feminist ethics are strongly dependent upon moral courage, particularly of the psychological kind. Moral courage has, over time, been defined as the act of overcoming fear of rejection in order to maintain ethical integrity (Putnam 2010); remaining authentic while facing rejection, discord, or condemnation (Lopez et al. 2010); and behaving in a prosocial manner with few or no rewards (Osswald et al. 2010). Simola (2015) clarifies that in work environments where harassment, abuse, and other immoral behaviors are practiced, moral courage is definitely needed. While it requires a strong backbone, moral courage can help reduce groupthink, hypocrisy, and injustice, while it can promote proper conduct, strengthen trust, and give emergence to voices that were previously ignored. Supporting Simola’s stance is Nelson (2004), who suggests a Buddhist consideration, supported by feminist ethical thinking, that builds upon deep connectivity between all beings and invites us to deviate from us versus them mind-sets, especially when that entails the perception of seeing business entities as impersonal systems.

## Feminist Ethics and the #MeToo Movement

Over the first two decades of the twenty-first century, a major upsurge of sexual harassment and

sexual assault reports rattled the status quo in a widely diverse world of professional performance. Generally known as the #MeToo movement, but also manifested under a number of alternative titles globally, this social justice and empowerment movement primarily aims to demonstrate empathy and provide mental strength to women who became victims of sexual assault and harassment in professional environments. The #MeToo movement resulted in multiple high profile firings and severe criticisms.

Deliberating about this movement, Ozkazanc-Pan (2018) shares the insight that a collectivist approach to agency is necessary to provoke gender system change. She thereby coins the term “collective feminism” to underscore the importance of joining forces toward social change, including gender equality. Also contemplating the #MeToo movement, Murray (2019) alludes to the fact that there were private actors needed to join forces in changing a disturbing trend in the professional arena and describes this as a failure of the state to apply appropriate regulation of sex and sexuality.

Weighing the positive effects of the #MeToo movement against the negative, Zugelder (2019) points out that MeToo brought increased awareness about harassment through broad media coverage, also resulting in amplified reporting. The movement also led to better management behavior to curtail harassment tendencies and prompted improved prevention and training policies. Furthermore, MeToo has resulted in an upward trend of workplaces increasing their insurance coverage to compensate claimants and imposing economic sanctions for sexual harassment, while law enforcement has also become more alert and strict in that regard. On the negative side, Zugelder (2019) found that multiple polls reported increased levels of skepticism among the US population about sexual harassment, often accompanied by a negative perspective about women claiming such harassment, and demand that cases of more than two decades ago should not result in major penalties. Another criticism that emerged from the movement is the possibility of false claims that can ruin the careers of large numbers of innocent men. Possibly the most

concerning criticism is the possibility of MeToo instilling discomfort in managers to hire or promote women, as a way of taking cautionary measures toward potential harassment claims, hence generating a new level of gender discrimination, inadvertently prompted by the movement.

## Global and Other Concerns

Feminist ethics may be instrumental in heightened awareness when it comes to global business dealings. Joseph (2016) refers to the increasing degrees of globalized business practices in our times, where it becomes progressively important to be mindful of, and respectful to, cultural, generational, gender, and other diversity-based factors. Ethical decision-making processes may suffer if organizational leaders think that they are able to place themselves in the shoes of stakeholders from very different backgrounds and mind-sets. In consideration of this reality, a sincere call for caution is in place for those who adhere to Kant’s categorical imperative. At the same time, however, the relational foundation of feminist ethics should require the same level of caution suggested for Kant’s categorical imperative: a strong focus on relational considerations may lead to perceived nepotism or even discriminatory claims in the eyes of those that have little or no relationships with the ethical decision-maker. In management terms, too much focus on a relational approach could lead to in- and outgroups, with all moral code violations therewith.

Another concern that has been mentioned in regard to feminist ethics is the manifestation of gender binarism, whereby philosophers within this theory have a tendency to distinguish between only two genders, which represents a limited and unrealistic view. Additionally, some critics (e.g., Jaggard 1974) have called for the consideration of finding a way to bring together the best of multiple worlds – or perspectives – rather than creating separate ethical theories that only result in increased antagonism between proponents of the various theories.

## Financial Secrecy Index

Financial secrecy measurement; Financial secrecy scale; FSI; Index of financial secrecy; Levels of financial secrecy

## Introduction

This is an overview of the Tax Justice Network's measure or scale of financial secrecy in any political jurisdiction.

## Description

The Financial Secrecy Index (FSI) is an initiative of the Tax Justice Network (2016a). It is based on a biennial survey of secrecy jurisdictions from 2009, 2011, 2013, and 2015. “Secrecy jurisdictions” is the Tax Justice Network’s preferred name for what are more familiarly referred to as tax havens. They are an assortment of countries (e.g., Belgium, Greece), protected territories (e.g., British Virgin Islands), special administrative regions (e.g., Hong Kong), or crown dependencies (e.g., Guernsey). These areas of the globe are defined roughly by two characteristics, namely, (1) they have regulations, rules, and/or laws offering special benefits or advantages to nonresident commercial entities, and (2) most especially they offer a “veil of secrecy” prohibiting exposure of the identities of the ultimate owners of those commercial entities from laws, rules, and regulations of their countries of residence (Cobham et al. 2015). In short, secrecy jurisdictions offer nonresidents the opportunity to take a free ride on their competitors, customers, and neighbors at home, notoriously a tax-free ride, but perhaps as often as not, a free ride on laws against environmental pollution and worker rights. Shorter and cruder still, secrecy jurisdictions are areas of the globe in which theft from one’s competitors, customers, and neighbors is officially legalized.

The FSI is an attempt to provide a means of rank-ordering jurisdictions according to the intensity of their secrecy tactics and the extension

of their impact on the world. Instead of creating always controversial dichotomous lists of tax havens versus nontax havens, the FSI allows one to construct a mix of subjective and objective indicators of secrecy of various sorts that apply to all jurisdictions. Prior to each biennial survey, proposed survey instruments are crafted and updated from more or less expert responses to survey items involving 15 Key Financial Secrecy Indicators (KFSI). Authors of the FSI urge respondents to remember that “reasoned judgment” must be applied in scoring responses to survey questions.

The KFSI are subjective indicators (Michalos 2014) in the broad sense that people with different training, experiences, values, and purposes may reasonably have different views about various aspects of secrecy and, in particular, differences between illegitimate secrecy and legitimate privacy. As well, KFSI have features of objective indicators insofar as they may designate not only specific but even distinct numbers of laws and other objectively identifiable secrecy-related attributes.

Table 1 briefly displays the contents of each of the 15 KFSI in four categories. Regarding the first category of knowledge of beneficial ownership, three KFSI provide information on each jurisdiction’s level of banking secrecy in the form of effective access to existing banking data, whether there is a central register of trusts and foundations and whether beneficial ownership of all companies must be registered and updated with a governmental authority. In the second category,

information is provided on levels of corporate transparency regulation insofar as official records of beneficial ownership of all companies are publicly accessible, whether all limited liability companies must file and make online accessible annual accounts at a small cost and whether there is publicly accessible worldwide financial reporting of all companies on a country-by-country basis. The third category provides information on the efficiency of tax and financial regulation with respect to whether resident stock companies and financial institutions must report to domestic tax authorities any dividend and interest payments made to nonresidents, whether domestic tax authorities have dedicated units to assess large taxpayers using special taxpayer identifiers for analysis, whether there are unilateral tax credits for foreign taxes paid on foreign capital income (interest and dividend payments) sent home, and whether “protected cell companies” and trusts with “flee clauses” may be created in each jurisdiction. Finally, regarding international standards and cooperation, the fourth set of KFSI provides information on the effectiveness of the anti-money laundering tactics of each jurisdiction, on participation in multilateral automatic information exchange, or “upon request” bilateral treaties on the exchange of tax data, on the extent of participation in five international conventions on financial transparency and international judicial cooperation on criminal issues (Tax Justice Network 2016b, pp. 24–27).

The set of respondents invited to complete reviewer surveys of the proposed KFSI before the biennial report in 2016 included “predominantly professionals and academics in the fields of economics, accounting, law, political science and international relations; experts within civil society and at international institutions; representatives of NGOs; tax authorities’ officials; and TJN’s supporters. . . [members of interest groups like] the Financial Transparency Coalition, Tax Justice – Europe, TJN Australia, TJN Africa, Canadians for tax fairness and Red de Justicia Fiscal” (Tax Justice Network 2016b, p. 40).

Data finally used to provide numerical assessments for each of the 15 KFSI in each biennial report come from “public reports by the OECD [Organization for Economic Cooperation and

Development], the associated Global Forum [on Transparency and Exchange of Information for Tax Purposes], the FATF [Financial Action Task Force], IMF [International Monetary Fund] and the US State Department. . . specialist tax databases and websites such as by the IBFD [International Bureau of Fiscal Documentation], PwC [PriceWaterhouseCoopers], Lowtax.net. . . Ministries of Finance and the Financial Intelligence Units of all 102 reviewed jurisdictions” (Tax Justice Network 2016a, pp. 6–7). The Global Forum (2016) report describes their peer review system and the data obtained from it. For the FSI report of 2015, there were 102 jurisdictions participating, and 92 had sufficient data to be included in the final ranking.

The total secrecy score for any jurisdiction is obtained by adding “the values of each of the assessed KFSIs and [dividing] the sum by the number of assessed KFSIs, expressing the resulting value (between 0 and 1) as a percentage score (0% to 100%). . . For example, if a jurisdiction was given a transparency credit for all 15 indicators, the resulting secrecy score would be 0%. No indicator being rated as transparent, in contrast, would result in a 100% secrecy score” (Tax Justice Network 2016a, p. 9).

Besides assessing each jurisdiction’s level of secrecy involved in financial transactions on the basis of 15 KFSI, the FSI includes a rough estimate of the global impact of each jurisdiction’s financial services activity. A global scale weight is assigned to each jurisdiction “according to its share of offshore financial services activity in the global total” using “publicly available data about the trade in international financial services of each jurisdiction. . . the largest weighting are those that play the biggest role in the market for financial services offered to non-residents” (Tax Justice Network 2016a, p. 2). In other words, “the global scale weight is an indicator of the potential for a jurisdiction to contribute to the global problem of financial secrecy, *if* secrecy is chosen in the range of policy areas discussed above” (p. 66).

As the authors of the report notice, the procedure described has disadvantages. First, they note that “a large part, perhaps the majority, of illicit financial flows may occur through trade in goods rather than through financial flows,” e.g., trade

mispricing involving resource extraction. They immediately grant that “future work could consider a reweighting with trade flows”. Second, they note that it is unclear “what kinds of services are included or left out in the computation of the financial services exports in the Balance of Payments. . . it is not clear for instance if fees for the provision of supporting legal services [are included, and]. . . fees associated with hosting and managing the legal structures. . . such as trusts, shell companies and foundations are likely not to be captured by financial services” (Tax Justice Network 2016a, p. 67). Taken together, it is likely that global scale weights as currently measured underestimate the scale of activity in secrecy jurisdictions, and the authors allow that these problems suggest a “fruitful research agenda.”

The total FSI score for any jurisdiction is obtained by multiplying the cube of its secrecy score by the cube root of its global scale weight. Cubes and cube roots are introduced to reduce the variation in each of the two components to a “similar order” (Tax Justice Network 2016a, p. 68).

Table 2 lists the 5 jurisdictions with the greatest and the 5 with the smallest FSI scores of the 92 jurisdictions assessed in 2015. Inspection of this table immediately reveals two things. First, each of the five jurisdictions with the highest FSI scores has secrecy scores of at least 60%. In fact, 57% of all the secrecy scores are at least 60% and

the average of the 92 scores is 60%. Second, it is possible to have a relatively high secrecy score (67–76%) but still have a very low FSI score. Presumably, policy makers in such jurisdictions have set the table for those in the market for financial secrecy, but few buyers have showed up.

## Financial Sector Sustainability Regulations and Guidelines

## Introduction

Over the past few years, there has been intensive discussion about how the financial industry might be affected by environmental impacts, such as climate change. There has also been discussion on how the financial sector can influence the environment and society in either a positive or negative way (Carney 2015; Wiek and Weber 2014). As an example, the G20 initiated a Task Force on Climate Related Disclosure that developed guidelines for managing climate-related risks in the financial industry, such as climate change, (Task Force on Climate Related Disclosures 2016). Furthermore, the Sustainability Accounting Standards Board (SASB) has developed standardized indicators that should become part of mandatory corporate disclosures.

Though environmental risks are addressed by many lenders (Weber et al. 2008) who integrate environmental, social, and governance (ESG) criteria into their financial decision making (Weber and Feltmate 2016), only recently have international (Basel Committee on Banking Supervision 2013) and domestic financial sector regulations been addressing environmental and sustainability risks (Oyegunle 2016b). This chapter discusses new advances in financial sector sustainability regulations and policies including their scope and implementation.

## Why Environmental Regulations for Banks?

Banks hold most of the global financial assets, and bond markets as well as institutional investment are growing rapidly (Zadek and Robins 2015), suggesting a significant impact of the financial industry on the economy and sustainable development. Therefore, the sector is strongly regulated. Newer risks, such as environmental and social risks, however, have not been part of these regulations. Nevertheless, sustainability issues have recently been integrated into financial regulations, particularly in emerging countries, such as China, Nigeria, and Bangladesh, but also in the European Union. Obviously, the drivers to

implement such regulations vary across jurisdictions. Based on Oyegunle and Weber (2015), the following three drivers help to explain why countries integrate sustainability into their financial regulations.

Social pressure and environmental pollution have been a reason to implement financial sector regulations. Often, emerging economies suffer under significant environmental pollution, and direct environmental regulations are hard to implement and enforce (Weber et al. 2015). While developed countries see the financial industry mainly as an enabler of economic growth that should not be limited by too many regulations, developing countries realize that the financial industry might be a source of governance that helps to get access to other industries through financial capital.

One way the financial sector followed to address sustainability and environmental issues has been voluntary codes of conduct. The most well established are the United Nations Environmental Program Financial Initiative (UNEPFI), the Equator Principles for social and environmental risk management in project finance, and the Principles for Responsible Investment (PRI) addressing institutional investment. While UNEPFI addresses sustainability and the environment in the financial sector including banking and insurance, the latter two codes of conduct address specific financial activities, such as project finance and investing.

The codes are increasingly popular with a growing number of signatories from about 80 project financiers that have adopted the Equator Principles to more than 200 signatories of UNEPFI and more than 1700 members of PRI. These voluntary codes of conducts provide sustainability guidelines for their members that help them to integrate environmental and social issues into their business and consequently to create a more sustainable financial market. The codes of conduct contributed to the integration of sustainability aspects into the financial sector and to the standardization of environmental and social risk management processes. It is still unclear, however, whether these “soft laws” really have a positive effect on the sustainability impact

of their signatories as well as on their financial risks, or whether they have to be complemented by financial sector sustainability regulations (Weber 2018).

One example of such a financial sector sustainability regulation is China's Green Credit Policy, where environmental pollution is a motivator to introduce financial sector sustainability regulation. The policy consists of guidelines and regulations that integrate environmental aspects into financial decision-making (Bai et al. 2013) in a standardized way (Bendell et al. 2011). It is designed to enable banks and financial markets to support the transformation to a greener economy (Busch et al. 2015; Oyegunle and Weber 2015; Zhao 2015). Its goal is to initiate green innovation (Aguilera-Caracuel and Ortiz-de-Mandojana 2013) in the financial sector as well as in other sectors. This regulatory approach is discussed in more detail below.

Another regulatory driver is the external pressure from international financial aid institutions, such as the Dutch Development Bank (FMO) and IFC that can lead to the implementation of some of the sustainable finance regulations. International finance is a way to access financial capital for many banks in developing countries. International finance institutions, however, have been integrating guidelines for the use of their funds that address environmental and social impacts for a long time. Therefore, some countries implemented financial sector sustainability regulations to guarantee access to foreign investments by domestic banks through complying with the goals of international finance institutions. One example for this is The Nigerian Sustainable Banking Principles implemented in 2012 (Oyegunle and Weber 2015).

A third driver to introduce financial sector sustainability regulations is peer pressure from regional neighbors. For example, after Brazil introduced their Social and Environmental Responsibility Policy in 2014, other neighboring countries felt the pressure or the opportunity to adopt such guidelines. Such regional implementation supports economic relations with the neighboring country that has implemented similar regulations and supports a more sustainable

financial industry. The rise of financial sector sustainability regulations in South America seems to confirm this assumption.

Many of the countries that have introduced financial sector sustainability guidelines are members of The Sustainable Banking Network (SBN) hosted by IfC (see [http://www.ifc.org/wps/wcm/connect/topics\\_ext\\_content/ifc\\_external\\_corporate\\_site/sustainability-at-ifc/company-resources/sustainable-finance/sbn](http://www.ifc.org/wps/wcm/connect/topics_ext_content/ifc_external_corporate_site/sustainability-at-ifc/company-resources/sustainable-finance/sbn)). Members of the network are financial sector regulatory agencies and banking associations from emerging markets who want to advance sustainable finance. The network offers the opportunity to learn from each other about ways to create incentives for sustainable finance. Currently, it has 40 members from 34 countries and a regional Latin American network, and there is a strong likelihood that this network will play an important role in promoting sustainable banking activities across these emerging markets.

### **The Chinese Green Credit Policy as an Example of Financial Sector Sustainability Regulations**

One of the leaders in implementing green financial industry regulations is China (Weber 2017). The Green Credit Policy China was implemented in 2006 by the Ministry of Environmental Protection, the Peoples' Bank of China, and the China Banking Regulatory Commission (Aizawa and Chaoferi 2010). The regulation demands the restriction of loans to polluting industries and adjusts interest rates in a way that considers the environmental performance of the borrower. Industries, such as pollution control facilities, environmental protection and infrastructure, renewable energy, circular economy, and environmentally friendly agriculture are eligible for these green loans with reduced interest rates (He and Zhang 2007; Zhao and Xu 2012). Furthermore, the policy asks lenders to reduce loans to polluting industries and to withdraw loans to borrowers suffering from controversies or instances of non-compliance (Jin and Mengqi 2011).

The regulations are compulsory for all Chinese banks, regardless of whether they are government owned, joint-stock banks, or credit unions (China

Banking Regulatory Commission 2012). Therefore, this financial regulatory approach created the need to develop and implement environmental policies, strategies, and assessment systems to evaluate the environmental impact of borrowers and investees (Chan-Fishel 2007). Studies suggest that the guidelines do not harm the financial performance of the Chinese financial sector but rather lead to higher returns and lower credit risk (Cui 2017; Weber 2018).

Whether the implementation of the Green Credit Policy has been successful, and whether it helps create a cleaner environment, while ploughing a path to a low carbon economy remains a controversial discussion (Hill 2014; Jiguang and Zhiquan 2011; Zhang et al. 2011; Zhao and Xu 2012). Hence, to help banks to implement financial sector sustainability regulations, and to overcome difficulties in assessing environmental information from clients, the China Banking Regulatory Commission (CBRC) issued the Green Credit Guidelines in 2012 (Zhao and Xu 2012). These guidelines may serve as example for guidelines in other countries of this regulatory approach.

### Scope of the Financial Sector Sustainability Regulations

As mentioned above, the regulations have different drivers, though all of them address environmental and social issues, they also differ in their scope. While the Chinese regulation mainly addresses environmental issues, others focus on societal need or on governance. Social aspects of the policies often address stakeholder engagement and labor practices. Furthermore, many focus on risk management and on products and services with positive impacts. Most of the policies, however, address environmental issues, such as environmental risk management, green finance, and emissions and climate change. Furthermore, reporting and auditing the reporting are part of a number of financial sector sustainability policies and regulations. Of the three sustainability aspects, economy, the environment, and society,

the focus is on environmental aspects (Oyegunle 2016a, b; Oyegunle and Weber 2015).

### Conclusion

The above-mentioned regulations strive to integrate the financial sector into social and environmental sustainability financing (Park and Ren 2001; Song et al. 2010; Wang and Juslin 2009) and to manage financial risks arising from sustainability problems. Consequently, they may have a positive impact on both sustainable development (Scholtens et al. 2008; Stephens and Skinner 2013) and financial sector stability (Carney 2015). However, only if financial institutions build up necessary resources and capabilities to address sustainability risks and opportunities, they will be able to achieve a positive impact on sustainable development, to reduce financial risks (Weber et al. 2008), and to develop innovative sustainable financial products (Chang and Sam 2015).

In general, financial sector sustainability regulations as an addition to voluntary codes of conduct are intensively discussed and might have a significant impact on the future of sustainable banking and finance. Since more countries adopt sustainable finance regulations, there is an opportunity to explore whether and how these policies are successful and whether they should be implemented in industrialized countries as well. Initiatives, such as the Sustainable Accounting Standards Board (SASB), an industry-lead initiative, also trying to implement mandatory reporting standards for climate-related risks, might be a sign of the acceptance of such regulations in both emerging and western developed countries.

### Discussion

Regulative approaches accept the role of the financial industry as a central player with significant impact on the sustainability of other industries. The introduction of regulations and guidelines for the financial sector would help the

industry ask their client to achieve high sustainability standards in order to receive attractive finance. Instead of “policing” voluntary sustainability standards, lenders and investors could invoke regulation, if they are required to disclose the environment and social risks of their clients. The example of the Green Credit Policy in China, however, suggests that good implementation is crucial for the success of sustainability regulations with regard to a more sustainable financial sector (Aizawa and Chaofei 2010; Bai et al. 2013). Finally, our research suggests that financial sector sustainability regulations should go hand-in-hand with voluntary codes of conduct instead of substituting them. After all, voluntary approaches guarantee the involvement of the particular industry, and regulation provides a strong motivation to contribute to achieving the goals of the voluntary codes of conduct (Weber 2016).

## Five Elements of Normative Ethics

## Introduction

All adequate normative-ethical theories have to contain the following five elements: (I.) normative individualism, i.e., the view that in the last instance moral norms and values can only be justified by reference to the individuals concerned, as its basis; (II.) consideration of the individuals' concerns and interests – aims, desires, needs, and strivings – insofar as they have a justificatory function; (III.) a pluralism of references of these concerns and hence of moral norms and values to all possible elements of actions; (IV.) the necessity of a principle of aggregation and weighing with regard to these concerns; (V.) finally, as a central principle of aggregation and weighing, the principle of relative reference to self and others, operating as a generalizing metaprinciple that guides the application of concrete principles and decisions (von der Pfordten 2010, 2012).

## I. Normative Individualism

Normative individualism contains three principles:

- (1) *Only* individuals can be the ultimate point of reference of moral obligations and hence the justificatory source of morals and ethics. Collective entities such as nations, peoples, societies, communities, clans, families, ecosystems, etc. cannot fulfill this function. Accordingly, like the obligated actor the

obligating other has to be an individual in the last instance. In other words: The basic moral relation only exists between individuals. One may call this the “principle of individuality” of normative individualism.

- (2) In the last instance, justifications of actions or decisions have to take into account *all* individuals affected by an action or decision, i.e., all “moral patients.” One may call this the “all-principle” of normative individualism.
- (3) All individuals affected have to be considered in principle equally. One may call this the “equal-consideration-principle” of normative individualism.

Within academic discourse, the intuitive idea underlying normative individualism appears under various terms and labels: “humanism,” “legitimatory individualism,” “subjecthood of human beings,” “subjectivism,” “self-determination,” “autonomy,” “individuality,” “value of the individual,” “freedom,” “person,” “liberalism,” and “democracy” (Schneewind 1998; Feinberg 1986). Which label one chooses does not matter. The important point is their congruence in content. One can further characterize normative individualism by comparing it with other positions:

The principle of normative individualism is consistent with the fact that *individuals normally live in a social context* – matrimony, families, neighborhoods, communities, and nations. No reasonable ethics can deny this. Normative individualism implies *no egoism*. As a matter of fact, individuals also have altruistic desires and idealist goals. One can empirically observe these altruistic desires and idealist goals in our day-to-day life. They enter the process of weighing not as objective truths, however, but as individual concerns and ideas. Nor does normative individualism support egoism, for there is no reason why individuals should take an interest in egoism in the long run. In order to understand the ontological-empirical embeddedness of normative individualism, it is important to realize that it does neither presuppose nor support an egoistic view of man. Normative individualism does not lead to *relativism* of ethical justification. Admittedly, the individual concerns that are its foundation are dependent on the respective individuals and to that extent contingent, but, first, there are basic needs that any individual has, e.g., the need for fresh air and nourishment; second, the contingency of some concerns does not preclude objectivity of

deliberation. Normative individualism traces ethical justification back to individuals, but this does not preclude that *collective acts or goals* such as social equality are *pursued and supported*, that is, it is consistent with a modest form of communitarianism. The opposite of normative individualism is the *principle of normative collectivism*: Actions and decisions can have their ultimate ethical justification only in a *collective*, that is, the group, family, clan, nation, people, race, ethnic group, society, economy, legal, cultural, or language community, neighborhood, etc. The assumption of normative collectivism is, that the justification of at least *some* decisions is not to be traced back to the respective individuals in the last instance but to collectives. Stronger versions of normative collectivism even hold that *all* or at least all *crucial* decisions are to be justified by reference to collectives. Normative individualism and normative collectivism are not contradictory but *contrary*. That is, they do not join to an exhaustive disjunction which precludes other possibilities of ethical justification such as religious justifications, value-objectivistic justifications, or justifications in terms of natural law. However, due to their metaphysical claims, such justifications have lost their credibility in the modern era. Their general acceptance can no longer be expected, let alone demanded. Many modern ethical theories, e.g., utilitarianism, Kantian ethics (Kant), or contractualism, are in accordance with normative individualism in some of their elements. (Kant 1968; Bentham 1963)

Why is it that, according to the *principle of individuality*, only individuals can in the last instance justify moral obligations or evaluations? There is an undeniable moral and hence normative asymmetry between morally significant individuals and collectives. One speaks of concerns and interests of collectives and thus presupposes the existence of such concerns and interests. But one can always ask whether these collective concerns and interests are in accordance with the morally relevant concerns and interests of the members of the collective. Is, say, a company’s activity really in accordance with the moral interests of its employees, shareholders, and other stakeholders? Does the representative of a family really act according to the moral interests of all family members? By contrast, the inverse does not hold: When individuals are morally affected and do not act as representatives of a collective, the question whether the interests of the individuals are really in accordance with that of the collective

cannot reasonably be posed as a normative or moral question but at best as an empirical question.

The fundamental asymmetry between the moral consideration of individuals and collectives, respectively, becomes apparent when collectives are dissolved. Setting aside religious or otherwise transcendent justifications, there is no moral reason why a collective should be preserved against the will, that is, the interests and desires of all of the individuals concerned. If all morally relevant individuals agree, a collective's dissolution is not morally objectionable. For instance, it has not been considered as morally questionable – but at best as inexpedient – when the USSR or Czechoslovakia dissolved. Similarly, one does not consider it morally objectionable when friendships end or when a club decides to dissolve itself. Only disappointed expectations, unfulfilled duties, or other concerns and interests related to the collective's preservation can be susceptible to negative moral evaluations; these concerns, but not the ceasing of the collective itself, may lead to duties of compensation or delay. It is morally neutral since the community as such, independently from its acceptance by its members, has no intrinsic value by itself.

## II. Aims, Desires, Needs, and Strivings (Concerns and Interests)

If all individuals concerned are the ultimate point of reference for moral justifications or obligations, respectively, the question is which property or aspect of individuals should be considered as normatively decisive? These properties of individuals are *strivings*, *needs*, *desires*, and *aims (intentions)*, or, generally: *the will*: *Strivings* are purely vegetative-bodily properties whose function is to sustain bodily integrity, beyond the mere effects of physical forces. They can be characterized as the local and temporary inversion of general physical entropy and can only be found in microorganisms, plants, animals, and human beings, but not in inanimate matter such as stones or water. Human strivings, e.g., are those for bodily temperature balance. Strivings of plants are, for

instance, that their leaves turn to sun light and take up water from the ground, against the natural direction of gravitation. *Needs* often have a bodily basis, but they can be mentally influenced, e.g., with regard to when and to what extent they are satisfied. Only human beings and animals have *needs*, e.g., for food, water, excretion, warmth, etc. *Desires* sometimes also have bodily components but are primarily mental phenomena. Unlike needs, their mental components can completely override possible bodily components; they can modify the need or even suppress it altogether. Although it is primarily humans who have desires, higher animals can have them as well, e.g., the desire for company, protection, entertainment, new experiences, etc. The line between needs and desires is not sharp. For instance, in higher animals, the sex drive is a need, whereas when one speaks about humans, one would rather speak of a desire for sexual unification. After all, humans can also be celibate. Finally, *aims (intentions)* are purely mental properties and, as far as one knows, they can be had only by humans, even though recent studies show that some higher animals can also make use of tools in a purpose-oriented way. In order to handle the variety and complexity of these aspects, it is reasonable to subsume them under a single term. The synonymous terms “concerns” and “interests” suggest themselves here, given that one does not take them in an egoistically reduced sense.

## III. Pluralism of References in Moral Evaluations and Obligations

In principle, the concerns of moral patients can pertain to all aspects of an agent's action in the widest sense. For that reason, it is important to analyze the concept of action. A complete, full-fledged action in a comprehensive, morally relevant sense contains at least the following seven elements:

- (1) The *internal*, *external*, and *general conditions* of the action, that is, as *internal conditions*: values, feelings, thoughts, habits, emotions, needs, strivings, virtues, mental states, and

general convictions of the agent; as *external conditions*: the community within which the agent lives, their competences, profession, and property; and finally, as *general conditions*: the society's moral, political, or economic situation, its social order, laws of nature, etc.

- (2) The agent's concrete *convictions* (*a*) and *desires* (*b*) that, in the course of a process of deliberation, determine the action-guiding intentions or aims. This process also includes external processes such as conversations and consultations. The crucial convictions will usually be evaluative or normative. But descriptive convictions can also play an important role.
- (3) The agent's action-guiding *aims* or *intentions* which may also include multilevel intentions.
- (4) The process of *developing the concrete will*, that is, descriptive means-ends-considerations and assessments of proportionality; by choosing appropriate means, these considerations and assessments lead from action-guiding aims to the concrete will to act. Again, the conditions mentioned above may play a role, e.g., preferences that make the agent choose one rather than another means. And again, the will-forming process also involves external elements such as conversations or consultations.
- (5) *The will to act or to omit an action* resulting from the will-forming process; it manifests itself in *the selection of a means* and immediately directs the action or omission of an action. Frequently, there will be several wills since various partial actions are required for achieving the intended end.
- (6) The agent's *acting* or *omitting an action* as an immediate behavior and outer result of the process of deliberation, that is, the external action in a narrower sense.
- (7) The *consequences* of the action or the quasi-consequences of the omission insofar as they were intended or at least anticipated, avoidable, and go beyond the sheer action or omission as such.

#### IV. The Necessity of a Principle of Aggregation, Weighing, or Balancing

In the case of possible or real conflicts, the individual's concerns have to be weighed against each other or aggregated in order to reach a justified moral or ethical decision. A comparable principle of deliberation or aggregation, respectively, is maintained by utilitarianism (as a maximizing principle or sum principle), by deontological ethics (as a generalization principle), and by almost all other ethical theories except for egoistic ethical theories such as Nietzsche's or situational, decisionist ethics.

#### V. The Principle of Deliberation Regarding the Self- and Other-Relativity of Individual Concerns

With regard to the fifth element, one would have to discuss all material and procedural deliberation and aggregation principles: the contractual principle, the discursive principle, the equality principle, the maximization principle, the maximin principle, the pareto principle, the satisficing principle, the generalization principle, etc. According to the critical view maintained here, all of these principles are legitimate to a certain degree; however, they are either too abstract and for that reason only combine the four elements addressed so far. This means that they cannot materially direct the deliberation or aggregation, respectively (contractual principle, discursive principle). Or, they are too concrete and hence only apply to certain cases (equality principle, maximization principle). Here, an alternative proposal for a metaprinciple is set forth that can direct and guide the application of the more concrete principles, the "principle of self- and other-relativity of individual concerns": The more the origins or the realization of the concerns or the interests of a morally considerable individual depend on others or a community, the more the respective concerns and interests have to be relativized in the process of deliberation, and the more the community may decide according to its common goals.

One can distinguish three kinds or zones of concerns or interests: (1) concerns of an *individual zone*, which are not dependent on particular others, e.g., body, life, and physical and psychic integrity – concerns, that is, that can be localized within the symbolic boundary of the body; (2) concerns of a *relative zone* which partially depend upon others or a community, e.g., the freedom of action, of speech, of religion, and of profession, and help by others in cases of distress; (3) concerns of a *social zone* which are almost completely dependent upon others or a community, e.g., the interest in shared activities in public or private life, in culture and sports, in natural resources, access to economic infrastructure, equal opportunities, etc.

In order to deliberate between potentially conflicting concerns, one can now refer to this tripartite scheme of zones, rather than to the abstract principle of self- and other-relativity. To that end, one has to relate the potentially conflicting interests to those different zones. The next crucial question is, then, whether there are conflicts between concerns belonging to the same or to different zones.

### Conflicts Between Concerns of the Same Zone

In this case, two principles seem plausible:

- (1) If there is a conflict between interests of the individual zone, the principle of equality holds. If, for instance, lives have to be weighed against each other, all individuals concerned have to be considered. There is no reason why the life of one person should be attributed a higher value than the life of another.
- (2) If there is a conflict between interests in the relative zone, one has to distinguish the following cases: The principle of equality also holds for deliberations of individual actions, e.g., when two persons aspire to a job. There is no reason why one profession should be more valuable or more important than another. However, when it comes to conflicting concerns, further aspects that

extend beyond those found in the individual zone have to be taken into account. To the realm of private exchange of goods, for instance, the pareto principle applies. Everybody can seek his advantage by agreeing to contracts. It can be assumed that nobody will agree into something that he believes to be a disadvantage for him. When considering the public distribution of goods, in contrast, community-related references will play a more important role since the goods in question have been produced in collaboration. Here, Rawls' difference principle suggests itself at least as a starting point for argumentation.

- (3) When it comes to conflicts between concerns in the social zone, the other- and community-dependency of interests becomes most effective. In that case, the maximization principle seems most plausible. The community can aim at optimizing the sum of shared interests, e.g., interests concerning political projects.

### Conflicts Between Interests of Different Zones

Here, deliberations are more complicated. Some cursory remarks may suffice.

- (1) Generally, concerns of the individual zone have absolute priority. After all, one could not justify why the personal concerns of single individuals should be subordinated to those of the other zones. For instance, one must not put others at risk for the sake of pursuing, say, one's own job ambitions or public plans such as building measures; also, torture is not permitted as a means for promoting the common welfare, etc.
- (2) Similarly, concerns belonging to the relative zone – such as the desire for a certain profession – have priority in relation to concerns of the social zone such as cooperative projects. The individual person must be conceded the freedom to decide whether they prefer to join cooperative projects or rather want to work on their own. The individual must not be forced,

say, for the sake of his family's interest, to choose a particular job or a particular partner.

The metaprinciple of the self- and other-relativity of individual concerns that has been proposed as the fifth element of ethical justification calls for further specification, e.g., its relation to more specific principles of aggregation, distinctions such as those made between duties of omission and duties of assistance, the relation of duties and rights, etc.

## Introduction

In the United States, companies that produce or sell food products have wide but not unlimited latitude when marketing their products. Laws at the federal and state level prohibit false or misleading statements in advertising food (including food labels). Two federal agencies, the FDA and the FTC (Food & Drug Administration and Federal Trade Commission, respectively), get involved to varying degrees in enforcing those laws.

## Legal Issues

Advertisements for food, as with other products, make various claims about the products. What legal restraints apply to those advertisements?

## Free Speech

In the United States, any discussion of whether a company's advertisements can be regulated starts with the First Amendment to the US Constitution, which says that Congress "shall make no law . . . abridging the freedom of speech." The US Supreme Court has held that the First Amendment allows for the regulation of false or misleading statements. *See, e.g., Virginia State Bd. Of Pharmacy v. Virginia Citizens Consumer Council, Inc.*, 425 U.S. 748 (1976).

Companies producing and selling food are engaged in what the law calls "commercial speech" – that is, speech (marketing campaigns, ads in print and online, etc.) for the purpose of selling a product. There is not one settled

definition about what comprises “commercial speech” or even about the precise legal test that should apply to such speech. But in general, commercial speech receives less protection under the Constitution than speech that is for the purpose of creative expression or political protest – meaning that the government is more free to pass laws regulating commercial speech.

#### Federal Laws

Two main federal statutes govern in the arena of food advertising. First, the FTCA (Federal Trade Commission Act) requires that advertisements – for food and otherwise – be truthful and not deceptive (21 USC §331, 343). Second, the Lanham Act prohibits false or misleading advertisements or labels and allows for a civil suit against anyone who “misrepresents the nature, characteristics, qualities, or geographic origin” of products. See 15 USC §1125(a). Importantly, the Lanham Act does not give a remedy to consumers who claim they were misled by an advertisement or label. Instead, it is available to commercial entities as a way to address unfair competition. For example, a producer of pomegranate juice claimed that a competitor labeled its juice as being mostly pomegranate juice, when in reality the competitor’s product was largely made of (less expensive) blueberry and apple juices. That misleading label could dupe customers into buying the competitor’s juice instead of the one made up of mostly pomegranate juice. See *POM Wonderful LLC vs. Coca-Cola*, 134 S.Ct. 2228 (2014).

Congress passed a third statute that affects advertising for food or other products, the CAN-SPAM Act (Controlling the Assault of Non-Solicitation Pornography and Marketing Act of 2003), to address “spam” or unsolicited emails, but its provisions are more broad than that. The law prohibits deceptive electronic messages, including deceptive headings or subject headings. It also requires that electronic advertisements include certain content, including the sender’s postal address, a notice that the message is an advertisement, and that the recipient may take steps to stop the mailings. It also includes fines

for violations and a private action for anyone adversely affected by the communication (See 15 U.S.C. §7701-7713).

#### State Laws

Various state laws allow consumers to bring suit for false or misleading food advertisements, such as the California Unfair Competition Law and the California False Advertising Law (See Cal. Bus. & Prof. Code §17500).

#### “Natural” and “Organic”

There is no federal rule defining what “natural” or “organic” means or when it can be used in marketing a food (at least, at the time of this writing). The FDA (Food and Drug Administration) has sought comments on a possible rule to define the term “natural.” The FDA has said its policy is to construe the term to mean “that nothing artificial or synthetic (including all color additives regardless of source) has been included in, or has been added to, a food that would not normally be expected to be in that food. However, this policy was not intended to address food production methods, such as the use of pesticides, nor did it explicitly address food processing or manufacturing methods, such as thermal technologies, pasteurization, or irradiation. The FDA also did not consider whether the term ‘natural’ should describe any nutritional or other health benefit.” (See <https://www.fda.gov/Food/GuidanceRegulation/GuidanceDocumentsRegulatoryInformation/LabelingNutrition/ucm456090.htm>).

The US Department of Agriculture operates the National Organic Program, which oversees items labeled as “organic.” Products may be labeled as “USDA Organic” if they meet the program’s requirements. See <https://www.ams.usda.gov/publications/content/about-national-organic-program> (“Organic is a labeling term for food or other agricultural products that have been produced using cultural, biological, and mechanical practices that support the cycling of on-farm resources, promote ecological balance, and conserve biodiversity in accordance with the USDA organic regulations.”)

## Ethical Issues

Food manufacturers and restaurants sometimes face dilemmas about when to alert the public of dangers found or suspected to be in food and how broadly or narrowly to address the issue. See, for example, the example of Chipotle restaurants (Strom 2016). In addition, producers face decisions about what studies provide support for health claims touted on labels or in advertisements. For example, the court in *POM Wonderful* noted arguments about the ethics of trials that involve depriving patients of needed vitamins in order to assess the effects of those vitamins but quoting the FTC as saying that one who makes “express representations about the level of support for a particular claim” in an advertisement must “possess the level of proof claimed in the ad” – whether through controlled trials or otherwise – and must inform consumers about that proof (See 777 F.3d 478, 496–97 (D.C. Cir. 2015)).

More broadly, advertising generally presents many ethical issues. This is perhaps not surprising given advertisers’ goals to (a) get consumers’ attention and (b) sell products that consumers may or may not actually want. Scholars have noted the function of advertising to create desires, not just respond to them. And the role of fast food in creating high rates of obesity, especially among children and in countries with fewer regulations, is a related ethical matter.

## Definition

Food-related research in general is rich, varied, and from multiple perspectives including the health sciences – specifically nutrition – analyses of the broader agri-food system and related value chains, food engineering, and sociocultural perspectives to name a few. The rise of food studies in recent years focuses on the larger political, economic, and cultural context of agri-food systems as distinct from more technically focused research on food production, distribution, and more physiologically oriented nutritional work. Questions of values and ethics are either explicitly identified in the scholarship on food or implicit in the topics and research questions that are asked and the manner in which they are approached and answered.

## Overview

Building on the work of some early pioneers such as Goody (1982), Douglas (1984), Belasco (1989), and Visser (1991) to name a few published in English, there has been an explosion of multi-disciplinary scholarship on food in the last 20–30 years to the point that food-related research might be seen as a newly emerged discipline. This has been accompanied by the creation of a plethora of journals, scholarly associations, and other types of infrastructure to support the growth in research and teaching activity. Research on food, diet, and agri-food systems generally is rife with issues of values and ethics to the point that there is a Springer encyclopedia on food and agricultural ethics (Thompson and Kaplan 2014). This article will touch on a few of the main issues with respect to values and ethics pertaining to food-related research, particularly food systems and food security.

There has been considerable work in conceptualizing and mapping various aspects of the food system from various perspectives, all of which have built-in value assumptions. This entry makes use of UN Food and Agriculture Organization (FAO) economist David Neven's (2014) concept of sustainable food value chains (SFVCs). He defines an SFVC as:

the full range of farms and firms and their successive coordinated value-adding activities that produce particular raw agricultural materials and transform them into particular food products that are sold to final consumers and disposed of after use, in a manner that is profitable throughout, has broad-based benefits for society, and does not permanently deplete natural resources. (Neven 2014, vii)

Hence, Neven's SFVC concept is different than a simple supply chain due to its emphasis on vertical coordination through governance mechanisms, mapping of entire sectors, and explicit references to value added and sustainability as performance measures.

According to the Food and Agriculture Organization of the United Nations (FAO):

Food security exists when all people, at all times, have physical social and economic access to

sufficient, safe and nutritious food, which meets their dietary needs and food preferences for an active and healthy life. (World Food Summit 1996)

However, this definition is a bit of a “motherhood statement” with controversy focused on the causes and possible solutions of food insecurity, and this is where questions of values and ethics come into play. Furthermore, there is growing interest in the more expansive concept of food sovereignty, a concept advanced by La Via Campesina, which goes beyond the mainstream World Food Summit definition to challenge the dominance and control of large multinational agri-food corporations and assert and protect the place of small-scale producers and distributors. Conceptually, therefore, it resembles the concept of food justice, which is less utilized, but both definitions share a commitment to an explicit set of values and ethics related to social justice, democratization, and public accountability in opposition to what is seen as a neoliberal agenda (La Via Campesina 2003).

## Debates on Causes of Food Insecurity and Possible Solutions

There are various core debates related to global food security. A fundamental issue is whether or not there is enough food to feed the world, now or in the future. A high-level form convened by FAO in 2009 concluded that food production should be increased by up to 70% to feed a world of more than nine billion inhabitants by 2030, which has been an enduring theme infused by Malthusian assumptions (FAO 2009). Others have demonstrated for decades – including studies released by FAO since 2009 – that there is more than enough food to feed the world now, as well as the predicted global peak population of nine billion and that issues are primarily around distribution, access, and entitlements due to poverty, not supply as the world produces enough to feed every man, woman, and child nearly 3000 calories per day (Alexandratos and Bruinsma 2012; Lappé and Collins 2015). Indeed, Nobel laureate in Economics, Amartya Sen, is well known for his food

entitlement argument (Sen 1986), which we might think of as one that revolves around questions of values and ethics if food is seen as a human right. For example, the fact that much land is used to produce meat and animal products, sugars, and processed foods – which has questionable health and environmental impacts – has led many to argue for the need for sustainable diets from which sustainable food systems can and should eventually flow. While there is no agreement on what a sustainable diet is, a common feature of most views is eating lower on the food chain with a greater emphasis on fresh fruits and vegetables and far less consumption of processed foods and animal products. Some have argued for vegetarianism and vegan diets. There is also growing attention to activities ancillary to producing and accessing food and their overall impacts. For example, in wealthy societies, driving to buy food is a significant source of greenhouse gas production. Thus, the lens of the food/energy/water nexus is a central now and in the future and revolves around what values we do or do not hold dear in terms of human and environmental health.

Other controversies revolve around potential solutions to food security. For example, there are different perspectives on the role of markets versus that of the state with some favoring market-based solutions, others emphasizing government responsibility with a reasonable policy perspective recognizing the importance of the two. Similarly, there are different views on the role of science and technology and how far one should go, for example, with respect to genetically modified organisms, particularly transgenic foods that combine genes from species that could not normally be bred through conventional means.

Last, but certainly not least, there are both explicit and implicit assumptions about the role and importance of international trade with respect to the global food system and differences of opinion regarding how much emphasis there should be on trade as opposed to supplying local needs. While no reasonable authors reject the notion of trade entirely, it's a question of the appropriate balance between supplying local and domestic needs and international trade.

Generally speaking, there is a “David vs Goliath” narrative within the food scholarship discourse. One perspective values small-scale, locally oriented production where another supports multinational agri-food conglomerates who supply a global market. A question to be asked is whether this is a true dichotomy as, first, small-scale producers are often ensconced in global supply chains controlled by large-scale firms and, second, large food conglomerates regularly acquire smaller-scale enterprises, once they are successful. A mapping of the gray areas between these two perspectives in both theory and practice with specific references to issues of values and ethics may be required.

## Other Overarching Issues

More recently, in addition to the traditional concern around starvation and the stunting of growth due to the lack of proper nutrition, an article public by *Lancet* concluded that obesity is now a bigger problem than hunger (NCD Risk Factor Collaboration 2016). While approximately 800 million individuals are still chronically undernourished, mostly in Asia and Africa, the Millennium Development Goals from 2000 to 2015 largely succeeded in reaching their target of cutting hunger by half (MDG Monitor 2017), in many ways due to economic growth in China and, to a slightly lesser extent, India. The new globally inclusive Sustainable Development Goals aspire to address food security from various dimensions by 2030 (FAO 2017).

## Conclusion

While values and ethics within the emerging field of food studies are not always explicit, they are often implicitly at the heart of the work being done by scholars approaching eating habits and the analysis of agri-food value chains. The discourse in food studies tends to be somewhat bifurcated along ideological lines with the majority of scholarship leaning toward progressive ideas such as food sovereignty and justice couched in a

commitment to the fair distribution of resources and the redressing of power imbalances within the larger food system. However, at the empirical level, there is a local/global dialectic and complex value chain simultaneously involving micro, small, and medium enterprises and large multinational agri-food and related corporations. It is therefore perhaps more difficult to make firm distinctions between the reality of the food system and foodscape on the ground and the analytical constructions associated with food studies scholarship though the field is evolving quickly and promises to continue to yield new and exciting work.

## Fraud Triangle: Cressey's Fraud Triangle and Alternative Fraud Theories

## Introduction

There has been much attention on explaining causes of fraud based around the “Fraud triangle,” the original theory developed by Donald Cressey in 1953 who modified it many times, most

recently in the early 1970s. The theory originated from sociology literature and was adopted as an empirically valid explanation of fraud describing three necessary conditions for crimes to occur: pressure (a non-shareable problem), opportunity (lack of internal controls), and rationalization (the ability to justify one's actions). Cressey's theory focused on the individual and identified improving organizational internal control measures as the deterrent for preventing fraud.

The basic assumption of Cressey's Fraud triangle is that for people to commit fraud, the three "elements" of the triangle need to be present. For example, pressure (such as gambling and other addiction problems, credit card debt) is the "trigger" event in the cycle. The individual will then need to "justify" their actions and is referred to as rationalization – the ability of the individual to rationalize their behavior as acceptable. This is supported by published research demonstrating that many fraud perpetrators have no criminal record and are upstanding citizens and often long-term, trusted employees. Therefore, to commit the crime, they need to justify their actions against their previous, "law-abiding" behavior. This justification can take many forms, "revenge" for been overlooked for a promotion, thoughts of "paying back" the money, or even a feeling of "deserving" additional financial rewards due to their previous commitment to the organization.

The third element of the triangle presents "opportunity" as the catalyst that allows fraud to take place if both pressure and rationalization exist, and it is this area that organizations have been known to be complacent. Opportunity can include poor or lack of fraud-control policy, poor supervision, low levels of risk mitigation, weak internal software controls, a lack of segregation of duties, and poor governance in general. Within the fraud triangle, opportunity is the element that organizations or third parties are able to control or at least exert direct influence over to mitigate the risk of fraud.

The fraud triangle has been widely accepted by industry and studied in great depth in academic institutions worldwide. The US-based

Association of Certified Fraud Examiners (ACFE) and the AICPA (American Institute of Certified Practicing Accountants) are strong proponents of Cressey's approach. However, others have been critical of his work or have made modifications to the original theory.

## Modifications to the Fraud Triangle

The Fraud Scale (see Albrecht et al. 1984) is a refined version of the fraud triangle; the scale includes the elements of opportunity and pressure while substituting rationalization for personal integrity. These three conditions – opportunity, pressure, and personal integrity – are analyzed to assist in determining the fraud risk. The model was developed in an attempt to assist with the prediction of fraud though the provision of a better understanding of an individual and their likelihood to offend.

Another iteration of the fraud triangle is provided by Wolfe and Hermanson (2004) who refined Cressey's Fraud triangle through the inclusion of a fourth element to create a Fraud Diamond. The additional element was an individual's capability to commit the crime. The authors argued that in addition to the influence of incentive, opportunity, and rationalization, a person's traits and their individual abilities also play a significant role in determining if fraud may occur. The other subtle refinement was the renaming of "perceived pressure" to "incentive." They state that if there is available opportunity and personal capability, along with rationalization and incentive, then fraud will likely occur.

## Alternative Theoretical Explanations for Fraud, Bribery, and Corruption

There is considerable empirical evidence stemming from criminology, sociology, and organizational literature that suggests there are limitations to the fraud triangle and its various iterations. Branches of criminology theory attempt to

explain criminal activity and include classical theory, individual trait theory, social disorganization theory, differential association theory, anomie theory, strain and general strain theory, and rational choice theory (see Cullen and Agnew 2002). Each of these theories helps to explain crime, including white-collar crime such as fraud. A growing body of organizational research supports the application of criminology theory to examine the motivations of accountants, CEOs, and other high-level executives who have been involved in fraud, and many of those studies integrate a combination of criminology theories.

### General Strain Theory (GST)

Merton (1938) suggested that social problems such as crime result from a failure of institutions, families, and other structures to provide for the functional and effective needs of individuals leading to levels of strain. Cressey would describe strain as motivated purely by financial anxiety and represented in the fraud triangle as “pressure.” However, others suggest that the removal of something positive from an individual’s life (loss of respect from peers, intimidation or hostility from supervisors) can also lead to fraudulent activities. Regardless, a sense of alienation or anomie can manifest through a number of harmful actions including fraud.

It is argued that strain and anomie can arise from circumstances such as unattainable economic goals that create ongoing anxiety over the gap between an individual’s present statuses and approved societal goals of wealth and desirable levels of success (see Zahra et al. 2005; Cohen et al. 2010; Donegan and Ganon 2008; Langton and Piquero 2007). Strain is not a condition felt only by those of low social class, but affects anyone who feels blocked from attaining financial success, even if they are already considered wealthy and successful. The individuals’ reaction to strain is dependent on their personality traits and determines whether fraud will result.

An important aspect of GST is the role of coercion. In an organizational context, strain and

anomie are created through interpersonal or impersonal coercion at either the micro- and/or macro-level. Interpersonal (microlevel) coercion results from negative relationships within an organization and impersonal (macro-level) coercion from circumstances beyond an individual’s control such as structural arrangements and circumstances (e.g., the economic climate, levels of unemployment), all of which may lead to feelings of anxiety, desperation, and anger. In the modern context, anomie can stem from large, bureaucratic organizations where success may be less attainable or firms with harsh promotion policies, unattainable budgets, and/or unrealistic productivity demands. GST suggests that coercive interpersonal relations (e.g., unjust treatment) or impersonal forces (e.g., economic pressures) lead to feelings of frustration, desperation, and anger. If a person is affected by negative stimuli, this produces a “strain point,” which can lead to depression or antisocial behavior and, in an organizational context, fraud.

Cressey’s Fraud triangle and general strain theory consider how and why individuals commit fraud. If taking into consideration high-profile cases such as Enron and WorldCom, we need to consider the context of groups within an organization and how they form to commit fraud. Differential association theory is one approach to explain this occurrence.

### Differential Association Theory

Sutherland (1949) suggests that individuals’ interaction with deviant peers results in cognitive changes that make offending more attractive. This theorization has been augmented by several scholars who suggest that the application of rewards and sanctions (so-called operant and participant conditioning) is a significant source of behavioral reinforcement (see, e.g., Free and Murphy 2014; Donegan and Ganon 2008; Colvin et al. 2002).

When individuals are suffering from strain and anomie, social support within a deviant subgroup can help ease the strain. Providing financial

assistance, resources, positive affirmations, and guidance helps to reduce the impact of strain and anomie and also provides resources that allow individuals to cope with adversity through coercively pushing the adoption of the deviant acts of the subgroup.

We have seen many high-profile examples of subgroup deviant behavior from accountants and top management in cases such as Enron, Arthur Anderson, and HIH where a collective group of people who had previously acted ethically and had no prior criminal history committed fraud. Collusive fraud committed by employees at lower levels of the organization is also commonplace such as vendor fraud, payroll fraud, and asset misappropriation. Regardless of their level within the organization, the subgroups that formed to commit fraud adopted norms that were morally and ethically opposed to those of the more general groups within each organization (see Cohen et al. 2010; Donegan and Ganon 2008). This indicates that behavior of those involved in, for example, corporate scandals may have been learned from others through socialization with members with whom they identified.

## Conclusion

In essence, the above theories provide explanations on how and why individuals and/or groups form to commit fraud. Cressey's Fraud triangle is the most well-known and widely accepted approach to explaining how and why fraud occurs. However, alternative approaches to understanding fraud and other white-collar crime also provide useful insights. Fraud is a societal problem that can only ever be minimized – never eliminated. Cressey's Fraud triangle, general strain theory, differential association theory, and other theories stemming from criminology, sociology, and organizational literature provide insights into individual and group-level contexts, structural conditions, and characteristics that may lead to criminal behavior.

### Introduction

As of writing, the Covid-19 virus has infected over 280 million individuals and claimed 5 million lives worldwide, representing one of the most severe and protracted crises in recent history. The pandemic has highlighted the numerous difficulties inherent in maintaining public health, with countries finding the road to herd immunity a long and winding one: many countries continue to face high infection numbers, recurring waves of infection, novel viral strains, strained healthcare resources, and slow vaccination rates.

An emerging obstacle in this fight is noncompliance with pandemic management guidelines (Norton et al. 2021). Rates of noncompliance with demonstrably effective measures like frequent handwashing, mask-wearing, social distancing, and vaccination are considerable and worrying, even when (and, sometimes, because) such measures have been made mandatory (e.g., Chan 2020; Dror et al. 2020; Hills and Eraso 2021). This issue is often exacerbated by low levels of trust in governments and the politicization of the pandemic (Conway et al. 2021; Fancourt et al. 2020). Noncompliance is no trivial matter either; only a few noncompliant individuals are needed to trigger “super-spreader” events that quickly derail any progress made on the public health front (Majra et al. 2021). This entry describes how non-compliant behaviors can be understood as a form of

free riding by applying classic and evolutionary game theoretic perspectives and conceptualizing public health as a public good. Following which, this entry describes some ways to manage free riding behaviors before closing on a note about the sociocultural factors that complicate efforts to promote public health, particularly the emerging and damaging role of conspiratorial thinking.

### Game Theoretic Perspectives and Pandemics: Noncompliance as Free Riding

A starting point for understanding noncompliance as a form of free riding is to consider the role of public goods, which refer to commodities and services that are non-excludable and non-rivalrous (Olson 1965). Not only is it difficult to prevent those who do not pay for a public good from using it (i.e., non-excludable), one person’s use of a public good also does not diminish its availability for others (i.e., non-rivalrous). Classic examples of public goods include clean air and national defense. Similarly, public health can be conceptualized as a public good – once achieved, no one can be excluded from the benefits of public health like herd immunity or low levels of infection, and one person’s enjoyment of public health does not reduce the “available amount” of public health for the next person (Smith 2003).

As public goods are produced through collective action, there is an inherent incentive for individuals to hold back on contributing to its production (Olson 1965; Yong and Choy 2021). Individuals may be motivated to withhold their own contribution – especially when they anticipate that the critical mass of collective action required for producing a public good will be achieved – since non-contributors are rarely excluded from the benefits of a public good. Consider, for instance, the production of herd immunity, where if enough people in the population decide to bear the costs of getting vaccinated (e.g., side effects), a smaller number of individuals may enjoy the benefits (i.e., herd immunity and slowing infection rates) without paying for them. However, the downside of such free riding

behaviors is immediately obvious. While one or a few individuals holding back on getting vaccinated may not impose too large a drain on public health, herd immunity would certainly not be achieved if everyone behaves in such a manner. Therein lies the public goods (or social) dilemma: Individuals face a choice between incurring costs while contributing to the production of a public good *or* withholding such contributions while benefitting from sufficient collective action at the risk of depleting the public good (Yong and Choy 2021).

Situations like the public goods dilemma, where the payoffs (and costs) for each person's chosen strategy depends on the strategy of others (i.e., the payoff structures are interdependent), have been studied extensively through an economic framework known as game theory. Game theorists have modeled such situations as "games" in which players choose between cooperation and defection. In the public goods game, players choose to either contribute to a common resource (cooperate) or not (defect). As illustrated above, while the optimal solution would be for all players to cooperate and contribute equally, players simultaneously experience the temptation to defect. Generally, experiments employing such games have shown that prolonged cooperation is rarely achieved as an outcome; without the implementation and enforcement of structures to prevent free riding, even players who behave cooperatively at first switch to defection over time (Falkinger et al. 2000; Fehr and Gächter 2000; Perc et al. 2017). This basic finding also emerges in studies of phenomena related to public health. For instance, experimental studies of vaccination decisions have shown that as people perceive their group to be increasingly vaccinated, they increasingly decide to not undergo vaccination themselves (Böhm et al. 2016; Ibuka et al. 2014).

## Managing and Preventing Free Riding

How then can free riding be managed, if not prevented? Classic game theoretic perspectives stress that sanctions are a key strategy as they

disincentivize free riding behavior by increasing the costs of noncompliance. During the Covid-19 pandemic, such sanctions have taken the form of regulations and punishments, including restrictions on the freedoms of unvaccinated individuals (e.g., not being able to enter specific places or travel overseas) or punitive measures (e.g., fines) against individuals who do not comply with pandemic management guidelines such as social distancing requirements. Notably, punishment by a third party (e.g., the police or the state) is often preferred to punishment by one's fellow citizens (i.e., vigilantism), since third-party bodies can enforce fair behavior without undermining social relations among the public (Traulsen et al. 2012). Punishment enforced by a governing body is not only helpful but also critically important when the likelihood of retaliation against individual punishers is high, or when social norms do not promote calling out on others' bad behavior (Raihani and Bshary 2015).

Nevertheless, whether regulations and punishments should be imposed is an issue that generates significant controversy in societies where the pandemic has been politicized (Naso 2020). For instance, in countries with high levels of distrust in governing bodies or scientific institutions, sanctions to enforce vaccinations or other forms of public health behaviors are often perceived as violations of basic human freedoms (Schmelz 2021; the next section explores this issue further with a discussion of noncompliance driven by conspiratorial thinking). Moreover, the implementation of monetary punishments such as fines can backfire: People may either feel so justified about their noncompliance to the extent that they are willing to pay the fine, or feel that having paid a fine entitles them to noncompliance – both paradoxically lead to increased noncompliance rates, particularly for those who can afford it (Gneezy and Rustichini 2000). These examples of pushback suggest that extrinsically motivated sanctions may not always be effective in encouraging compliance (Cato et al. 2020; Yong and Choy 2021).

Social dilemma researchers have also drawn on evolutionary perspectives emphasizing natural or evolved biological factors to understand how

defection can be reduced more effectively (e.g., Maynard Smith and Price 1973). According to evolutionary game theory, humans possess a psychology that is designed to promote cooperative behaviors, quickly detect noncooperation, and motivate sanctions against free riders (Fehr and Gächter 2000, 2002; Norton et al. 2021). Such inclinations have, to a large extent, evolved in response to the need for high levels of cooperation among our hunter-gatherer ancestors who took part in high-stakes tasks (e.g., hunting, warfare) that were critical for survival and reproduction (Tooby et al. 2006). Such a psychology can be observed from people's pandemic-related behaviors. For instance, experimental studies show that vaccinated individuals tend to behave less prosocially toward unvaccinated individuals, which reflects that people – especially those who have incurred the costs of vaccination – view unvaccinated individuals as reneging on the social contract and are motivated to impose sanctions on such perceived free riders to prevent further exploitation (Korn et al. 2020). Emotions also complement people's sense of morality and function as powerful motivators for action. Indeed, the negative feelings that people experience when they perceive others to behave unfairly often spur sanctioning behaviors against free riders (Fehr and Gächter 2002); in turn, the shame and guilt from the threat of being poorly regarded by cooperators can motivate free riders to fall in line (Jacquet et al. 2011; Sznycer et al. 2016). One study on a large sample of Japanese participants showed that the tendency to experience shame from behaving in ways that others disagreed with predicted the likelihood of curbing unnecessary social interaction during the Covid-19 pandemic, indicating that emotions like shame can motivate positive behaviors – especially in societies where relational harmony and social obligations are highly regarded (Cato et al. 2020). Overall, leveraging on humans' deeply rooted inclinations for cooperation has been and will continue to be an important avenue for the management of free riding during pandemics.

Alternative strategies can also be used in concert with sanctions to effectively promote cooperative behavior and reduce free riding. A critical

policy aim is to promote prosociality, which is a key driver of cooperation (Campos-Mercade et al. 2021b). Given that individuals behave more prosocially when the links between their interests or outcomes and those of the group are emphasized (Chapman et al. 2012), appropriate framing of the costs and benefits of cooperation will be important. As discussed elsewhere (cf., Yong and Choy 2021), social norms that encourage prosocial attitudes will help to cultivate an organic and bottom-up proclivity for cooperation that can be more resilient and effective than heavy-handed, top-down policies.

## Non-game Theoretic Considerations

It is important to note a growing body of work that identifies the various sociocultural factors that complement existing game theoretic perspectives on noncompliance. For example, younger individuals who expect to have less serious symptoms from infection may be less inclined to engage in health safety behaviors (Moore et al. 2021), while marginalized individuals such as the poor may also engage in noncompliant behaviors not so much out of a desire to free ride, but more so due to an inability to withstand the economic losses sustained from abiding with safety measures like enforced lockdowns (Blundell et al., 2020).

An emerging phenomenon that has seriously frustrated the pursuit of public health goals during this pandemic is conspiratorial thinking – such as the belief that Covid-19 is a hoax propagated by the “deep state.” In part, such thinking is a maladaptive manifestation of the human striving for sense-making in unfamiliar and uncertain situations (Douglas 2021; Yong et al. 2021). Critically, such forms of noncompliance are not driven by the desire to make use of others' contributions to avoid contributing, but because they do not believe in the existence or harms of Covid-19 and consider advocates of public health policies as dishonest and malicious (Douglas 2021). For conspiracy theorists, sanctioning their noncompliance can trigger feelings of persecution and inadvertently solidify their beliefs, leading

them to understand their noncompliance as a form of righteous resistance and engendering ever more stubborn noncompliance (Arnot et al. 2020).

Therefore, while the actions of noncompliant individuals may be seen as free riding through a game theoretic lens, sociocultural factors can create significant variation in the costs and benefits of noncompliance for different groups of individuals. For many of these groups, noncompliance can still be managed using game theoretic strategies to increase the (dis)incentives of (non)cooperative behavior, such as by offering rewards when people get vaccinated or by providing financial assistance to those affected by public health measures like lockdowns (Campos-Mercade et al. 2021a; Chan 2020). However, noncompliance rooted in conspiratorial thinking poses far greater difficulties as conspiracy theorists do not perceive public health as being under threat and instead view the governing and scientific authorities, as well as those who believe in the dangers of Covid-19, as the actual threat (Douglas 2021). To tackle conspiratorial thinking, strategies aimed at changing people's deep-seated beliefs will instead be required (Yong et al. 2021).

## Conclusion

The Covid-19 pandemic has revealed the numerous obstacles in managing public health, and noncompliance with pandemic management measures has emerged as one such challenge. A game theoretic perspective that conceptualizes noncompliance as free riding on public goods can produce meaningful insights into understanding this problem, but it is also important to note the limits of classic game theoretic approaches and consider the role of evolutionary and sociocultural factors when designing effective public health guidelines to manage noncompliance.

## Funding and Sponsorship of Publications

Charon A. Pierson  
Committee on Publication Ethics,  
Gilbert, AZ, USA

## Definition

Most significant scientific research is funded through a variety of mechanisms and the research is conducted in single universities or corporations or in multiple sites around the world. Although global comparisons are difficult, funding sources include governments, corporations, and to a lesser degree, philanthropic organizations. Monies are allocated through a mix of hard sources (i.e., budget allocations directly to specific projects) and soft sources (i.e., competitive grant awards).

In certain fields, such as biomedicine, there is a long history of collaboration between industry and academia, while in other disciplines, such collaboration rarely occurs. Funding mechanisms can vary also, but most commonly, monies are allocated to an institution and not an individual researcher. Research budgets include money for materials, personnel, institutional overhead (e.g., electricity, office or lab space, ethical oversight, publication management), and more recently, funds for dissemination through open access publication.

### What Are the Issues?

Unless there is a very clear demarcation between researchers and funders, there is a risk of ethical misconduct in the form of conflicts of interest (COI) with potential to bias the outcome of the research (see Carrick-Hagenbarth 2018). Competing interests may be financial with funding bodies; however, nonfinancial interests can also be significant. Financial COIs appear more straightforward in situations where clear evidence of financial benefit can be seen in a specific outcome, such as significant improvement from a new drug in comparison with standard treatment (see, e.g., COPE Case 04-34, <https://publicationethics.org/case/competing-interest>, related to undeclared funding by a drug company of a favorable review article on one of the company's drugs). Although somewhat less obvious, a political, religious, or ideological COI (see COPE case 06-30, <https://publicationethics.org/case/conflict-interest>) has the potential to create the perception of bias. The long campaign by US tobacco companies to discredit scientific evidence about the harmful effects of smoking is a complicated and cautionary tale of the "exertion of commercial interests within science and medicine" (p. 1; Brandt 2012). In some disciplines, policies and procedures for mitigating COI are well developed and strictly followed. In other disciplines, where objective criteria are difficult to agree, readers

are left to make their own determinations. The primary mechanism for managing potential COIs in research funding is transparency; declaring sources of funding received by the researchers for the project is a minimum requirement for transparency. Declarations should be accessible on publications, funding announcements, institutional websites, as well as privately in selected circumstances.

*Declarations of competing interests on publications:* The biomedical publishing enterprise has developed comprehensive regulations for declaring competing interests, including funding statements. Since 1978 the International Committee of Medical Journal Editors (ICMJE) has agreed standards of manuscript formatting and preparation for the purpose of maintaining highest ethical standards in the conduct and reporting of biomedical research, one of which is the requirement to acknowledge all sources of support for the submitted work, including grants, equipment, drugs, or others (<http://www.icmje.org/recommendations/browse/roles-and-responsibilities/author-responsibilities%2D%2Dconflicts-of-interest.html>). Subsequent modifications led to the extensive requirements of the current ICMJE Conflict of Interest form (<http://www.icmje.org/conflicts-of-interest/>), which includes financial disclosures relevant to the current submitted work, financial activities outside the submitted work, intellectual property (patents or copyrights) "broadly relevant" to the work, and other relationships not covered in the above (personal fees, nonfinancial support, pending patents or licenses, and royalties). Disclosure forms are required by most biomedical journals and reviewed by editors and reviewers for potential competing interests to the submitted work. Most journals also publish the information submitted by the authors in a "declaration of competing interests statement" at the end of the article. Although declarations of financial statements do not guarantee the absence of bias, the statement serves as a warning to readers to consider the potential for bias in interpreting the results.

*Management of declared competing interests:* In some cases, a declaration of competing interest can be managed with careful attention to the process of review. For reviewers with expertise in a niche area and a bias toward a specific viewpoint, transparency in their review process can help to illuminate areas of concern. It is possible for reviewers of qualitative research, for example, to declare their philosophical and theoretical grounding in an introduction to their review of a paper or a proposal. This statement of orientation or approach can inform the review and provide an editor or grants manager with enough information to make an informed decision. Reviewers of biomedical grants and manuscripts will often be recused from the review if they declare competing interests with another drug or device company. Management of institutional competing interests may not be as easily handled; however, many academic institutions receive funding from diverse sources, which may diminish bias. Disclosure of major funding to a research institute within a university should be declared on any papers related to products manufactured or distributed by that company. A policy of transparency regarding financial disclosures at the institutional level, especially for large endowments of research institutes devoted to a specific field (e.g., lipid research, diabetes research, agricultural products), is important. Details should be publicly available on the website, in annual reports, and other accessible locations.

*Best practices in reporting funding sources:* Requirements of funding bodies for disclosure vary greatly and may require minimal to extensive detail. Some of the key elements are full name of the funding body and grant number, additional resources, and data handling. The full name of the funding body in the case of US Federal grants could include the name of the institute, center, or office and the name of the umbrella agency (e.g., National Institutes of Health, Centers for Disease Control and Prevention, Agency for Healthcare Research and Quality). If there is a grant number, that should also be included. Often abstracts and notices of funding are available for searching on the agency

website, and full disclosure facilitates that search. Frequently, additional resources are provided and should be acknowledged, such as data sets, cell lines, or biological materials. A critical piece of information is the data handling information. It should be clear that the researchers had full access to and control over the data, and the results are those obtained by the researchers. In the case of industry funding, similar elements should be stated. There may not be a grant number, but the full name of the funding company and its location should be stated (e.g., funded by XYZ Pharmaceuticals, New York, NY). For experimental drug studies, the name of the drug manufacturer and location should also be stated; this may not be the same as the funding company. In commercial funding, it is common that drug companies want to control the data to avoid leaking proprietary information before the conclusion of the trial. However, there should be at least one or two researchers who have complete access to all the data and who can guarantee the results as their original findings. The names of those researchers should be printed with the publication of the resulting paper, which is now a requirement of most major reputable publishers.

Funding of research is necessary but should be handled transparently to avoid COIs. Readers must have all the available information to make informed conclusions about the project.

## Future of Work: Values and Ethical Issues

Contingent work; Industrialization; Gig economy;  
Golden rule

### Definition

In order to understand the values and ethics associated with the changing world of work and its probably future trajectories, it is necessary to delve into the history of work and the major shifts that have taken place with the advent of the agricultural and industrial revolutions. Many of the assumptions that western industrialized societies have made about the world of work are in the process of being challenged with the rise of the “gig” economy. These changes are beginning to have drastic consequences not only in how labor markets are structured, but also in how workers see themselves and interact with their colleagues. Examples include moving from a hierarchical system where one reports to a supervisor to more fluid interactions related to the quality of interpersonal relationships as well as the need for an analysis of what goods and services the market requires and can pay for.

### Work in the Past

People have always worked. Initially it was hunting and gathering to acquire enough food and shelter to stay alive which depending upon the environment and the numbers of people would require greater or lesser amounts of time and effort. Once agriculture developed, food supplies became more reliable although bad luck or bad weather could lead to famine and farming

required ongoing, steady work except for the hungriest of seasons.

Even with all that effort, early agricultural practices enabled a family to produce no more than 10% more than was required for their own survival. This meant that 90% of the population toiled hard on the land for very little return with only necessity as their boss.

This changed in the eighteenth century CE with the agricultural revolution. New techniques of crop rotation and animal fertilizers meant that instead of needing 90% of people on the land to feed a population, 50% could now do the job and that share kept on dropping. The others could now be freed to produce those kinds of goods like plates and ample clothing that only the very richest had been able to enjoy before; but to do this, the way people worked had to change drastically.

The industrial revolution meant that most people now had to work together in factories. They had to get a job with a boss. They were told where to work and what to do. Someone else determined when they started work and when they could eat, rest, or even use a toilet nor could they stop work until the bell or whistle signaled the end of the work day.

Schools were one of the ways these former farmers were converted into factory automatons. Schools did provide basic literacy and numeracy to people who did not have them before, but they also prepared people for a factory job. School meant that you had to be at a certain place at a certain time and stay until you were released. School meant that you had to sit quietly in rows and do what you were told – excellent training for a job where you would be working for someone else.

In industrialized countries, this pattern of work has persisted into the twentieth century. Wages and working conditions have improved considerably. We can thank labor unions for much of that. More people worked in offices, hospitals, schools, and other establishments rather than in factories. But the basic pattern of work was still the same. You went to a job in a certain place for fixed hours. You had a boss who told you what to do even if you yourself were a boss over other

people. Schools still prepared you for your job by teaching you about timeliness and doing what you were told as much as by any specific skills you learned.

As we left the twentieth century, all this began to change.

## Work in the Future

The agricultural revolution meant that we no longer needed almost everyone to be a peasant. The industrial revolution turned those peasants into robot-like creatures repetitively doing what they were told in a structured, hierarchical environment. Now the technological revolution is filling all those robot-like jobs with mechanical robots. White-collar jobs that required more brains than brawn are disappearing in favor of computers with ever higher degrees of artificial intelligence. Even the concept of having a job is becoming much less ubiquitous.

If people will no longer work in jobs where they have to be continuously monitored and told what to do and how and when to do it, we will no longer need huge organizations be they factories, universities, or government offices. Armies will become leaner with mechanization, automation and drones replacing hordes of obedient, disciplined foot soldiers, and even jet pilots.

What people will do are all those things that cannot be performed by a machine or a computer. First there is the large category of work involved in conceiving, designing, building, and maintaining all the machines, computers, and systems that now do the jobs that people used to fill. Second there are those social activities that need a human touch.

We will be doing this new work in a pattern that is very different from merely getting a job. Instead of working for someone or something outside of ourselves, we will be working on our own behalf. We will work for what someone has called Me, Inc., and, in most cases, we will be the boss, the janitor, and everything in between within this new structure. Our support “staff” may include other people but will likely be largely digital. This self-employed work structure has also been called the

gig economy and not as a compliment. It has its disadvantages and its advantages.

The biggest disadvantage of this new work configuration is the lack of certainty and security. One could always be fired or laid off from a job, but the more usual practice was to stay in a given job for months, years, or even decades with regular pay checks and possibly even a pension when one reached the senior years. If you loyally served an employer, you expected that employer to be loyal to you. Without an employer, the only security is knowing what you are going to do next.

Now and in the future, people will not only have to think about how to do a job and then do it. They will also have to think about what good or service they can continue to provide that someone will be willing and able to pay for tomorrow and after that. In our rapidly changing world, that good or service will not stay constant for long. Furthermore, the skills and abilities that can generate a living now will require continuous adapting and upgrading to remain in demand. Moving to a totally new field or occupation may even be required.

The advantages of working for Me, Inc. are the opposite side of the disadvantages. You are no longer facing a life sentence of working for the boss, doing what you might not choose to do when and where someone else tells you. You set your own work hours although that often means starting as early as you want and finishing as late as you want rather than the other way round. You have a greater degree of freedom in selecting who you will be working with as colleagues, customers, or suppliers and also more geographic mobility when it comes to deciding on where you would like to live.

The tedium and boredom of routine jobs will no longer be a problem. All such activities will be relegated to computers and their steel-collar assistants. Instead there will be the ongoing buzz of excitement that comes from always being on the lookout for the activities and customers that will fill out next month's or next year's calendar and bank account. Sometimes this will be a bit more scary and tiring than positive, especially for today's workers who are now facing this big transition.

## The Transition

The hardest part of transitioning to the new world of work will be giving up the ideas and patterns that worked for generations up to and including the twentieth century. Those patterns involved staying in school; getting a “good” education and then a “good” job, preferably unionized, with a large public or private organization that ideally offered you generous pay and benefits; a chance for promotion; and a pension at 65. Such a situation enabled your parents to heave a sigh of relief. You were now looked after. You could get a mortgage, buy a house, and start a family.

Alas, as many new graduates are now realizing, that pattern does not always work anymore. Permanent, ongoing positions are fewer, farther between, and more fought over. Construction companies hire more contract workers and fewer long-term employees. Governments and phone (now communications) companies, long the safe havens for those who wanted stability in their careers, are cutting back on employees and getting more of their work done by consultants and other contingent people. Even colleges and universities are limiting tenure track appointments in favor of contract lecturers hired on as needed basis.

The reasoning behind this is not just to save money and cut down on overhead, although that is a factor. It is because the skills and abilities required are changing much faster than those of most employees. Unless she has been constantly upgrading, an engineer or even a professor of engineering who trained 20 or even 10 years ago will not be able to deal with, let alone teach, the new techniques, materials, and systems that have been developed in the last 6 months. A public relations officer who does not realize that your youthful target market is now moving from one messaging system to another will not be able to get your products out the door.

## Ethics and Values

Certain values and ethics are always required. Without sanctions against murder and theft, for

example, it would be difficult to maintain any form of civilized society. Honesty and effort are almost always part of a successful life. Other values are changing with the new structures of work.

Discipline has long been touted starting with telling children they should be seen and not heard. Discipline has been a big part of schooling. Good students were obedient, still, and quiet even if that went against the natural exuberance of childhood. The good employee did what he was told and nothing else. “I don’t get paid to think” has been a working maxim for many staff. Unquestioning discipline has been a mainstay of military organizations. “I was only following orders” has been used to justify unspeakable atrocities.

Today, anyone who waits to be told what to do and then does exactly that and nothing more or less can be replaced by a machine. Replacing external discipline is self-discipline.

People now need to show initiative, originality, and creativity, in other words, thinking outside the box. If, in the gig economy, you wait around for someone to tell you what to do or to give you work, you will be waiting a long time. It is self-discipline that will make Me, Inc. successful, getting you out of bed in the morning and asking and then answering the entrepreneurial question: what good or service can I provide that someone is willing and able to pay for? It then takes more self-started effort to produce that good or service, find customers, and generate income. If the Me in Me, Inc. does not do it, it does not get done.

Reputation is another changing value. For women, having a reputation usually had negative connotations. The name of a woman was to appear in the media only three times in her life, at birth, at marriage, and at death. For most workers, reputation was also a bad word. As the Japanese say, the nail that sticks out gets hammered down. Keeping your head down was a very good idea for most workers.

Now, having a reputation is not only positive but essential and it had better be a good one. If people don’t know that you exist, customers, contracts, and cash will not come your way. If people have heard bad things about you, that is even worse. The value of positive visibility

cannot be over emphasized. It is a positive reputation that will enable you to earn a living. Any threat to that reputation requires immediate damage control. Better yet is enough attention and caution so that reputational damage does not occur in the first place.

There is one ethical value that should be universal but has not been seen much in practice. Its star will rise with the changing work configurations. That is the golden rule: do unto others as you would have them do unto you. This has always been the ideal that has been preached (with variations in wording) from the pulpits of every major religion. It has not always been practiced.

Good bosses notwithstanding, many managers and supervisors would not like to be treated the way they treat their staff. And employees have been known to take their employers' products, equipment, and even money if they felt they could away with it. Stealing the time that the company has paid for, by example, taking it easy on the job is considered fair game.

With the growth of contingent work arrangements, doing to others what you would not want them to do to you becomes an unaffordable luxury. Employees who feared for their jobs in a tight labor market might have put up with ogres who yelled at them or made impossible demands. In the gig economy, a reputation for being nasty or slow to pay means that those who have any choice (and this includes all the good, capable workers) will avoid working with you. On the other side, delivering work that is sloppy or late rapidly diminishes the supply of further work that is likely to appear in the future.

It now behooves all those who want to get paid or who pay others to constantly consider and act upon the best interests of those they work with. Ethical values now coincide with what is needed to be materially successful. How you deal with others, whether we call it ethics, people skills, or emotional intelligence, is no longer just the icing on the cake. It is absolutely essential and it could lead to a much better work environment and even a better world. Doing well requires you to do good and doing good means that you will do well.

## Gender and Food Security

Gender bias; Sexism

### Introduction

Food security is recognized as a social determinant of health contingent upon a regular and consistent supply of foods meeting standard nutritional requirements. The Food and Agriculture Organization of the United Nations (FAO) states that food security “ensures that all people at all times have both physical and economic access to the food they need.” It raises significant ethical issues since: “eating often involves moral decision-making rooted within the context of cultures, traditions and social structures that impact human nutrition and health outcomes in a globalized way” (Fanzo 2015). Food security has traditionally been constructed as gender-blind despite the dominant role played by both women and men in food production, harvesting, and distribution and the significant constraints imposed on women preventing their full participation in these areas.

### Discussion

Historically, a flexible definition of “gender” that is subject to interpretation coupled with a lack of knowledge about how a gendered lens may be applied has resulted in gender being ignored or left out of the equation. Adopting a gender-based approach to food security requires a recognition of the differing and unequal roles of women and men and the context in which these roles are constructed and perpetuated. Reducing gender inequality is an important part of the solution to global hunger. Those countries with the highest levels of gender inequality as reported in The Global Gender Gap Report also relate the most severe hunger problems (Njuki et al. 2016). Adopting a gender-based approach is even more imperative given that global threats posed by environmental change will increase food insecurity. Some of these threats are posed by the greater frequency of extreme weather events that prove hazardous to the global food system and increase the vulnerability of marginalized peoples to food insecurity.

Food security is based on three areas: food availability, economic access to food, and nutritional security. Women play a dominant role in each of these three areas but also face socioeconomic and cultural inequities and constraints. Addressing and alleviating these constraints is a critical element of achieving food security worldwide.

## **Food Availability**

Both women and men work as farmers and natural resource managers and contribute to sustainable food production. In many cultures, women are primarily responsible for food preparation and distribution and for ensuring family and community health. Despite this active participation, women have unequal access to land including access to common property resources and to improved seeds, fertilizers, technology, credit opportunities, and advanced education. Women are paid less than men for the same work or are expected to carry out work on an unpaid basis. Women are inadequately represented on decision-making boards. The failure to incorporate both women's and men's perspectives results in a lack of diversity regarding decision-making processes, and women's unique knowledge and expertise goes unrecognized. Women and men possess different knowledge and transmit it in various ways due to their respective roles and responsibilities. Food productivity and security would increase should these constraints be alleviated.

## **Economic Access to Food**

Poverty remains a major threat to household food security with the most adversely affected and the most vulnerable group being women and children. These individuals are at greatest risk of developing malnourishment and/or obesity – both of which have a detrimental effect on physical and mental development, long-term health, and productivity. Discrimination against such disadvantaged individuals may lead to further marginalization of their needs and their contributions. As household welfare improves, so too does access to a consistent supply of high-quality food. In particular, women's incomes are closely connected to the nutritional status and health of children as women tend to spend a higher amount of their income on family food and healthcare. Women who are empowered within the household and who hold a higher status there

compared to men are actively engaged in decision-making processes at the household and community levels. This also results in the provision of higher quality healthcare for all household members including children. The greater the power of a woman within a household, the greater the access to food.

## **Nutritional Security**

Additional key contributors for nutritional security include ready access to adequate healthcare including nutritional information, childcare, sanitation, and clean water. Ensuring nutritional security is almost always the exclusive domain of women. In order to secure or provide these services for the family, women must invest significant time in order to care for household members. Despite the fact that a correlation exists between women's nutritional health and children's health, gender biases in food distribution and caregiving practices within the home may occur. This leads to poorer nutritional outcomes for girls and women and consequently reduces women's abilities as caregivers.

## **Conclusion**

Gender equality and the recognition that women's rights are human rights remains an elusive goal in many parts of the world. However, according to de Schutter (2013): "Gender inequality can make a substantial contribution to a country's economic growth and it is the single most important determinant of food security." This is reflected in an increasing number of gender-based strategies being developed and implemented worldwide by various institutional stakeholders. Given the far-reaching nature of many of the inequities and constraints faced by women, a complex multi-sectoral approach over the short- and long-term is required at the community, regional, and national levels. This challenging approach includes a greater recognition and understanding of the degree to which women are constrained

within food production; how poverty disproportionately impacts on women and how women's nutritional health is linked to children's health. Wide-ranging systemic changes are required to increase global food security through addressing gender inequality. These changes include modifying existing regulations, laws and cultural practices, challenging long-standing patriarchal traditions; promoting women's rights to land ownership; improving access to education for girls; valuing women's knowledge; encouraging the participation of women in nontraditional fields including natural resource management; improving political representation for women; and increasing women's participation on decision-making boards. Although unlikely to be achieved quickly or without disagreement over the appropriate interventions, addressing these constraints and removing these gender-based obstacles will benefit women, men, and children in society, promote social justice and help to bolster food security.

*Gender and Household Economics* is a field in economics that analyzes household decisions by assuming that some differences in persons' abilities to act in a certain way or their treatment by others vary by gender. These differences are usually taken as given. The source of these differences is either assumed to be biological or the result of social constructs like norms or institutional restrictions.

*Utility and Utility Function.* The utility function is a function capturing the well-being of an agent from any given consumption bundle; it represents the agent's preference ranking over all consumption bundles. These bundles may include actions like leisure or an action of another agent. Utility is the outcome from entering a specific combination of goods and actions into an agent's

utility function. For example, a person might experience a lower utility if in addition to a given bundle of goods their partner yells at them than in the absence of the yelling. In economics, we usually assume that each individual is endowed with their own preferences and hence utility function.

*Household Utility Function.* A household utility function is a function capturing the well-being of a household, not one individual, from any given consumption bundle. This bundle includes the consumption bundles of all household members.

## Introduction

Economics of the household focuses on actions taken by individuals within households. These actions include investment in children, purchases of durable goods or financial assets, labor supply and division of labor, the number and spacing of children, and formation and dissolution of marriage. Gender and Household Economics' focus is on the role that gender plays in household decision-making. This could be due to the gender of children (i.e., does gender of the existing children play a role in a couple's decision to have another child?), while parents are treated as a uniform agent. Alternatively, the decision-makers' genders might play a role in the decision process (is gender a factor in the bargaining power of a household member?).

Many actions of household members seem to depend on gender. For example, it is well documented that, on average, married mothers spend less time in employment than married fathers and that mothers tend to spend more time caring for their children than fathers (e.g., Stastna 2012; Bureau of Labor Statistics 2017) in different-sex couples. Empirical evidence from other disciplines suggests that parents treat sons and daughters differently (e.g., Park 2017) as well as empirical evidence from economics (see Lundberg 2005 for a survey).

In interpreting different treatment of men and women, it is important to make a distinction between differences in treatment and differences in well-being. For example, a different pattern of

investment in children based on their gender means that daughters and sons are not treated equally with respect to inputs, but it could still be the case that parents seek to equalize the well-being of their children regardless of gender; if boys and girls need different inputs to be equally happy, parents would not equalize their children's well-being (i.e., utility) by providing them with the same bundle of inputs. Unequal treatment of equals most certainly leads to unequal well-being, but if producing quality child care differs for boys and girls, unequal amounts of financial and time investments in boys and girls may not necessarily lead to a difference in boys' and girls' well-being.

Gender and Household Economics seeks to document systematic differences in household members' treatment and behavior by gender, provide explanations for such differences, and in many cases also provide a welfare analysis. That is, we are interested in whether a well-documented difference in observed behavior or treatment is an indication of a difference in well-being of an adult or child compared to their peer of different gender.

Gender and Household Economics is a growing field both in applied theory as well as empirical economics and finds applications in developing countries and developed countries. The increasing availability and access to individual-level data within households has spurred a growth in empirical studies in the field. Researchers also take advantage of field and laboratory experiments to understand how gender influences decision-making in the family and how a shift in decision-making power might change household members' actions and intra-household distribution.

Policy questions in the field often ask if measures targeting specific members in the household would make a difference in their impact on household decisions. Real-world examples of such policies are gender-based parental leave policies (e.g., "daddy months") or who should be the recipient of child benefit payments aimed at improving the standard of living for children (Brindle 2010). The lending practices of the Grameen Bank also reflect such considerations

(Esty 2014, Cross-reference: ► [Gender and Microcredit](#)).

## Models of Household Decision-Making

Some models in household economics aim at explaining differences in economic indicators by gender such as a gender wage gap or a lower labor force participation of married women compared to married men without addressing intra-household distribution. Unitary models of the household typically fulfill such purpose emphasizing that the result of efficient division of labor in a household tends to be specialization where the mother takes care of the children for more hours each day than the father.

Unitary models assume there is one utility function for the whole household, hence the term “unitary.” While the household in the unitary model consists of two adults and often children, the members act as if there is just one agent commanding the pooled resources of the household when maximizing household utility.

The main premise of these models is that a biological difference in the ability to produce household goods or an institutional difference in the ability to work in the labor market tilts the efficient division of labor in a household in such a way that leads to married men working more hours than married women and to married women spending more time in home production than married men.

It also means that if we switched the comparative advantages in home production between the partners, we would observe the opposite pattern of specialization, but the time spent in each activity would be exactly the same as before. Moreover, because pooled resources of the household remain the same, the well-being of each partner will also remain unchanged. To sum up, in unitary models, the answer to “Who does the dishes in the household?” does not tell us anything about the distribution of welfare among the couple.

The unitary model also leads to the conclusion that a change in the recipient of child benefits from the mother to the father would have no impact on how much money is spent on children in two-

parent households. The amount that the couple receives in child benefit is exactly the same no matter if the father or mother receives the payment, and hence pooled resources would be unaffected by such a change.

Many empirical studies have found violations of the pooled income hypothesis. For example, Part II of Haddad et al.’s book, as noted in their introduction (1997, p. 11), “begins with a critical evaluation of the empirical evidence – both informal and formal – that casts doubt on the unitary model,” and the editors conclude by arguing “that the existing evidence should be seen as shifting the burden of proof to an approach in which assumption of income pooling is defended rather than maintained.” Vermeulen (2002) includes more recent references to empirical work rejecting the pooling hypothesis.

## Bargaining Models

Family bargaining models treat household decision-making as the result of negotiations between the partners, each with their own utility function, so each partner derives utility from the consumption of their own private goods and possibly household public goods. Family bargaining models can be static (one period) or dynamic, and they either impose efficiency or allow for inefficient decisions. They can also be cooperative or noncooperative in nature. (See Bergstrom 1997 for a survey).

As in the unitary model, most bargaining models do not provide a link between specialization in marriage and intra-household distribution. This is true for all the bargaining models that impose efficiency. In efficient cooperative bargaining models, both spouses negotiate from a status quo or disagreement point to an efficient division of labor that increases the welfare of both spouses beyond their utility in the disagreement point by splitting their maximized marital gains. For simplicity, let us assume that the bargaining solution awards each spouse half of the marital gains in addition to the utility the spouses claim in their disagreement point. This means that if one spouse has a lower utility in the disagreement

point than the other spouse, the spouse with the lower disagreement utility will experience a lower welfare over all in marriage than the spouse with the higher utility at the disagreement point. Hence family bargaining models stress the importance of policies aimed at changing the disagreement point in order to influence intra-household distribution. What determines the disagreement point varies across bargaining models.

### Disagreement Points in Static Models

Some models take the utility when single as the benchmark. In this case, own earnings play the most pronounced role. Not earnings during marriage (which are the result of specialization) themselves, but earnings at the disagreement point are an important factor in a person's utility as a single relative to that of the partner's. A policy aiming at increasing the bargaining power of women could therefore aim at recruiting more girls into majoring in programs in which women are underrepresented but that lead to higher earnings. This would narrow the gender wage gap of singles and then change the bargaining power of these women in marriage.

Some models take the utility in divorce as the benchmark. In these models changes in child custody or alimony regulations change the disagreement utility and hence bargaining power of partners during marriage. These models can also speak to the benefit of women shelters; their existence increases the bargaining power of women in marriage because it increases women's utility in the disagreement point.

Some models use a hypothetical scenario in marriage as the disagreement point where partners play a noncooperative game or retreat to their sanctioned gender roles (e.g., mother stays home with the children and receives an allowance from the husband, while husband works full time). As gender norms change, so would the disagreement point and hence bargaining power of women.

Another influence on the bargaining process could stem from the use of force. Models of intimate partner violence (IPV) usually assume that men and women have different tendencies to use violence in a relationship and try to explain the mechanism behind the gender difference in

victims of domestic violence and evaluate policies aimed at reducing IPV.

### Dynamic Models and the Role of Specialization

Dynamic bargaining models typically allow for decisions in marriage in one period to impact the disagreement point in the next period. In such a case, spouses typically take inefficient actions, yet the assignment of who is doing the dishes is still driven to some extent by efficiency considerations not unlike in the unitary model.

For example, assume that both spouses start out with the same wage rate but one partner works full time in the first period of marriage while the other partner takes time off to take care of the children. Despite the same initial wage rate, due to the difference in labor force attachment in the first period of marriage, spouses will face different wage rates in the next period, and so different investments in one's labor market skills during marriage in one period may result in a difference in disagreement utility over time that is largely driven by the difference in specialization during marriage. In such a model, and in contrast to the unitary model or the static bargaining model, switching the comparative advantage in household production between partners while keeping everything else unchanged would lead to a lower utility of the person specializing in household production during marriage. Hence these models provide a link between labor force attachment during marriage and intra-household distribution of welfare. In other words, if spouses had a choice, they would rather be the spouse not assigned to doing the dishes.

### Competing Mates

The composition of the marriage market may also play a role in the bargaining power of a spouse. If women face a high male-to-female ratio of singles, depending on the assumptions of the bargaining model, this could lead to married women capturing a higher welfare than in a market where this ratio is low. The intuition for such a result is that whichever side has a higher number

would compete with each other more to match with a spouse from the different gender, and so the welfare of a spouse depends on the relative shortage of competitors in the marriage market.

## Negotiation Skills

Gender can play a role in bargaining power independent of earning power. For example, some models allow for different negotiation skills by gender in the bargaining process. In this case, even women with a high wage rate relative to their male partner could face a low bargaining power because they are socialized from an early age to accommodate demands from others.

## Relationship Between Collective Models and Bargaining Models

Above I contrast bargaining models with the unitary model. A more general approach that allows for the nesting of both the unitary model and the bargaining models is the collective approach. It assumes that the household maximizes a weighted sum of member's utility functions and allows for the weights to be influenced by age difference, earning potential, divorce laws, etc. These parameters are called distribution factors.

Collective models are more general than bargaining models in the sense that they leave open the exact decision-making process but allow for the parameters that influence the bargaining power of a spouse to play a role in how spouses allocate their joint resources. See, e.g., Vermeulen (2002) for a survey.

## Introduction

Economic development affects women and men differently. This statement may seem obvious today, but economists did not begin to even consider the relationship between gender equality and the macroeconomy until the 1970s. Since then, gender-aware research has sought to document the gender-differentiated impact of neoliberal macroeconomic policies adopted around the world in both low-income and high-income countries. Neoliberal policies, key features of stabilization and structural adjustment programs pushed by the World Bank and International Monetary Fund, encompass fiscal and monetary austerity, privatization of public services and goods, and liberalization of trade and investment flows. A growing number of economists have recognized that these macroeconomic policies are not gender-neutral in their impacts. In the reverse direction, gender relations in the household and market work to shape macroeconomic outcomes. As this body of research has expanded, international financial institutions have increasingly emphasized the synergy between growth and gender equality, and they have integrated gender equality into their institutional mandates.

The channels between gender equality and economic growth are complex; and considerable debate has emerged regarding both the direction of causality and the distributional consequences of growth. Gender-aware empirical research has shown that the relationship is contingent on a variety of factors, including the measure of gender equality, the time dimension of the analysis, and the structure of the economy and its institutions. This entry reviews the research on how gender equality and the macroeconomy interact and the kind of macroeconomic policies that promote gender-equitable well-being.

## Macroeconomic Policies and Gender Outcomes

Key policy objectives for sustained economic growth have traditionally included full

employment, price stability, and foreign sector balance, which are pursued through fiscal, monetary, and exchange rate policies. Since the early 1980s, the World Bank and the International Monetary Fund have enforced a particular set of macroeconomic policies – which they billed as “sound” and “sensible” – through their stabilization and structural adjustment packages. Typically, these packages encompass an initial macroeconomic stabilization component (currency devaluation to reduce the balance of payments deficit and an austerity program to curb the domestic debt). Stabilization policies are followed by long-term economic adjustment to prevent the recurrence of macroeconomic imbalances. The basic policies for adjustment include: (a) removal of government price regulation and subsidies, (b) privatization of public services and industrial enterprises to ensure their operation according to market criteria of profitability and to eliminate budget support for state-owned companies, (c) reduction of trade restrictions and orientation of domestic production towards export markets, (d) removal of restrictions on foreign direct investment (FDI) and financial flows, and (e) maintenance of balanced government budgets.

The standard macroeconomic models upon which these stabilization and adjustment programs are based do not include gender as a dimension of analysis, thereby implicitly presuming that macroeconomic policies have gender-neutral effects. Feminist economists have challenged this presumption, initially in the context of the impacts of these programs, which launched the feminist macroeconomics research agenda. Feminist economists have argued that because gender inequalities are embedded in social institutions, macroeconomic policies will affect men and women differently. In addition, household- and market-level gender inequalities in the division of work, distribution of income and wealth each work to shape macroeconomic outcomes such as the composition of aggregate demand and GDP growth. When analyses incorporate rather than ignore gender, class, and ethnicity effects, they

show that neoliberal reforms do not promote well-being in a broad-based manner.

Questioning the soundness of neoliberal reforms, feminist economists have argued that shrinking public budgets, restrictive monetary policy, and increased privatization have placed enormous pressures on the availability and quality of public services in countries around the world. They have also shown that these policies entail additional drawbacks for women – especially women in low-income groups – due to the constraints they face in the household and in society (Elson and Çağatay 2000). Adverse impacts include disproportionate job losses for women in public sector contractions, as well as increasing work burdens as women and girls have needed to cope with expenses of privatized education, healthcare, and water services. Based on this evidence, feminist researchers have argued that the soundness of macroeconomic policy needs to be judged not only in terms of traditional aggregate indicators, but also in terms of the gender-, class-, and ethnicity-differentiated impacts on well-being (Berik and Rodgers 2008).

Trade and investment liberalization – another component of neoliberal reforms – has had mixed blessings for women. Increased openness to trade and FDI in many countries has given women greater access to employment in export-oriented labor-intensive manufacturing. Women's jobs in highly competitive export industries (especially garments, textiles, and electronics) have generated new sources of foreign exchange, resulting in an increasing feminization of foreign currency earnings. Even in agriculture, women's seasonal or daily wage labor on farms has proven critical to keeping production costs low and export demand high.

However, employment gains for women have often been accompanied by downward pressure on wages, precarious working conditions, and an informalization of work in which jobs lack basic legal and social protections. While some have argued that wage discrimination is costly and necessarily declines in the face of competitive pressures in global markets (Black and Brainerd 2004), several studies using data from Asian

economies have provided compelling evidence of growing gender wage gaps resulting from increased trade openness (Berik et al. 2004; Menon and Rodgers 2009). In these cases, rising wage gaps are the outcome of employer efforts to compete internationally: as employers lay off workers in import-competing sectors and move to lower-wage sites, they obtain wage concessions from those still employed in a manner that disadvantages women workers. Research has also focused on the adverse impacts of the footloose nature of FDI moving from one country to the next in search of the lowest-cost producers. In particular, Seguino (2007) provides evidence that FDI mobility not only leads to lower wage growth but also has a negative effect on productivity growth in semi-industrialized countries.

Pressure from international markets to keep production costs low has increasingly induced firms to offer insecure jobs that are temporary, casual, and flexible (Beneria 2007). Across countries, increases in the proportion of the workforce classified as informal are partly explained by the growing tendency of final-goods producers to subcontract smaller-scale, home-based operations (Gwynne and Cristobal 2014). Home-based workers are predominantly women who work for lower pay (often on a piece-rate basis), receive few (if any) fringe benefits, pay their own utility costs, and work long hours. In view of their informal status, most home-based workers remain uncovered by labor regulations that impose costs on producers. They are predominantly new labor-market entrants, women who have lost their formal-sector jobs, or women who need to combine paid work with child care obligations.

A large body of evidence has documented poor working conditions, worker abuses, lack of union rights, and discrimination by gender in developing countries (Berik and Rodgers 2010). Despite these drawbacks, some researchers have argued that jobs in the export sector offer better pay as compared to many other alternatives for women (Kabeer 2004). However, this argument leaves the improvement of working conditions to the unfettered market. With pressure from consumers and the negative consequences of media exposure,

corporations have increasingly turned to voluntary self-monitoring through corporate social responsibility in order to address poor working conditions in developing country factories. Even if consumer-led corporate codes of conduct are proliferating, relying on companies to self-regulate compliance may be insufficient, especially in light of strong consumer demand for low-cost clothing, the lack of agreement among corporations and monitoring groups over a common set of labor standards, the large number of factories and subcontractors that remain outside the scope of private monitoring efforts and, above all, the unwillingness of corporate buyers to offer developing country suppliers unit prices that are sufficient to pay for decent working conditions.

Export orientation has contributed to rising employment opportunities for women. However, several studies have shown that in middle- and higher-income economies, women have experienced displacement from low-paying jobs in manufacturing industries that have upgraded their technologies, reduced the size of their workforce, and moved production to lower-wage countries. For example, Tejani and Milberg (2016) find evidence of a shift in labor demand away from women as a result of industrial upgrading in Southeast Asia and Latin America. And in Mexico, technological upgrading and rising capital intensity of export-oriented manufacturing has been linked to a relative decline in employment opportunities for women (Fussell 2000). Even in lower-income countries, women can experience job displacement when technological change makes traditional female jobs redundant and when women face barriers to training for new jobs.

Although financial liberalization constitutes another integral feature of standard macroeconomic policy reform packages, greater integration in the world's capital markets has contributed to increased vulnerability to financial crisis and exchange-rate shocks. A number of high-profile crises in the 1990s and early 2000s have spurred wide-scale discussions about the costs and benefits of financial liberalization as well as reforms to the existing international financial architecture. That said, empirical studies that focus specifically on financial liberalization and crisis through a

gendered lens are quite sparse, with results suggesting that the main cost is the additional burden created for women during financial crises and economic downturns (Stotsky 2006).

While gender-aware macroeconomic analysis has encompassed mostly empirical work, some theoretical studies have incorporated gender into macroeconomic models, including the representation of gender differences in consumption, savings, labor force participation, and unpaid care work (Çağatay et al. 1995; Grown et al. 2000; Braunstein et al. 2011). Some of this work follows the approach of modeling an economy as two systems: one includes the standard types of variables related to the macroeconomy and the other comprises gendered variables related to the unpaid reproductive economy. Other modeling efforts have incorporated gender-disaggregated variables in order to trace the implications of promoting gender equality for macroeconomic outcomes. For example, some models trace the effect on output of removing constraints on female labor supply or raising the earnings of women who have a higher marginal propensity to spend on consumption that benefits children's well-being. In building the macroeconomy as a gendered structure, these gender-aware models have contributed to the growing awareness of the valuation of women's care work, the constraints and costs that care work imposes on women, and the division of resources and tasks within the household.

## Gender Equality and Economic Growth

Economic growth can potentially reduce gender inequalities and enhance broad-based well-being through the utilization of newly generated resources. Economic growth can empower women and reduce gender inequality in health, schooling, labor-market outcomes, rights, and political voice. The causality can also run in the other direction, in that gender equality can promote economic growth and is a worthy goal to pursue for both intrinsic and economic reasons. Removing barriers and alleviating the constraints that women face can yield benefits in the home, in

the labor market, and even in the broader macroeconomy such that the potential productivity gains achieved by closing gender gaps will boost economic growth. Moreover, failure to close these gaps can actually harm economic growth through such channels as relatively poor health and educational attainment for women, inefficient allocation of resources, suboptimal governance in business and governments, and reduced aggregate productivity.

Several studies have shown causal links between economic growth and gender inequality, with growth improving or worsening inequality depending on the gendered indicator under consideration. Evidence indicates that economic growth reduces the disadvantages faced by women, especially in educational attainment, life expectancy, and labor force participation (World Bank 2011; Duflo 2012). Growth brings higher incomes and improved service delivery, which helps to close gender gaps in educational attainment, health outcomes, and employment. In some countries, technological improvements work to women's relative advantage as the returns to cognitive skills rise relative to the returns to manual skills.

A way in which growth can mediate women's welfare is by creating the need for structural changes that indirectly benefit women. For example, when economic growth is associated with greater public investment in infrastructure, it saves women time from collecting water and fuel, thus freeing up their time and other resources to engage in paid work or alternate remunerated activities. This type of transformation has been documented in countries like South Africa, where the mass roll-out of electricity to rural areas caused women's employment to rise by almost 10 percentage points while men's employment did not change (Dinkelman 2011). And in Morocco, a program that financed connections to piped water contributed to greater leisure time and less stress over water-related issues (Devoto et al. 2012). Conclusions about economic growth freeing up women's time hold not only for infrastructure, but also for labor-saving appliances and devices.

Yet economic growth may not be sufficient to improve gendered well-being in all its dimensions, especially if unpaid work burdens, biased laws, differential access to resources, and social norms continue to constrain women's ability to take advantage of new, well-paid employment opportunities (World Bank 2011). Gendered biases in access to new labor market opportunities play a crucial role in constraining women's advancement in the labor market and in achieving more equitable occupational distributions and narrowing pay differentials. These biases could be caused by inequities within households (especially women's relatively greater time burdens in performing unpaid household work), formal institutions (including statutory laws that favor men and inadequate public infrastructure that contributes to women's domestic work burdens), markets (particularly unequal access to credit, agricultural inputs, and investments in skills), and informal institutions (such as employers' discriminatory attitudes toward women workers and social norms that restrict women from engaging in market-based work).

In the reverse direction, gender inequality can impede economic growth. A growing body of empirical evidence indicates that gender inequality in education and employment can act as a drag on long-run growth. Educational inequality can contribute to women's unequal household bargaining power, which could potentially reallocate household spending away from children's needs, thereby reducing the quality of the future labor supply and long-run productivity growth. Systematic differences in investments in girls' and boys' education can be inefficient due to distortions in skill levels that channel men and women into gendered occupations, an argument supported with evidence in Klasen and Lamanna (2009). Their cross-country economic growth analysis indicates that countries with wider gender differences in labor force participation rates grow more slowly, with simulations showing lower growth in the Middle East, Northern Africa, and South Asia due to this effect. Closely related, greater equality in education can help to boost FDI by expanding the pool of skilled labor,

which, in turn, stimulates economic growth (Busse and Nunnenkamp 2009).

The widely emphasized positive association between growth and gender equality in education or labor force participation may not hold in the case of gender earnings inequality. There is a plausible case to be made that women's lower relative wages can raise profitability in sectors that employ women, boost investment or exports, and fuel economic growth. This growth effect poses a challenge for policy makers seeking to reduce gender wage gaps, since doing so may slow down growth, as the expected expansion in women's consumption spending is likely to be more than offset by decline in investment and exports (Seguino and Grown 2006).

The empirical evidence is not conclusive, and in a meta-analysis of studies that use regression analysis of cross-country datasets, Bandiera and Natraj (2013) conclude that this body of work cannot definitively demonstrate a causal link from gender inequality to economic growth. This failure is mostly due to the difficulties inherent in this methodology in identifying the direction of causality and in pinpointing the underlying mechanisms that link inequality and growth. Another criticism, echoed in Benería et al. (2015), is that cross-country regression analysis implicitly assumes that the role of gender inequality is similar across countries, ignoring the role of country-specific factors. These weaknesses can diminish the plausibility of claims that link gender inequality to growth. Although most cross-country regression analyses include controls for regional differences, the research strategy generally does not evaluate the effect of differences in economic structure among countries.

Results from this body of research on gender and the macroeconomy support the implementation and enforcement of a number of policy interventions. Of particular importance is a transformative approach that boosts the remunerative value and security of women's jobs, supports women's roles as caregivers at the same time that they are employed in productive market-based activities, and promotes equal opportunities for skills development and employment for women. Macroeconomic policy reforms are integral to this

agenda, with three specific directions for policy reform that need to be implemented at the multi-lateral and national levels: first, end fiscal austerity so as to facilitate public investment in infrastructure that boosts productivity, in particular, invest in a public social care infrastructure that provides care services for children, elderly, disabled, which predominantly employ women and which reduce the unpaid care burden of women in the labor force. This investment pays off in the long run by improving labor productivity and is more effective than investment in physical infrastructure in creating jobs and boosting current aggregate demand (İlkkaracan 2016). Complement this strategy with industrial policy that invests in upgrading of economic activities so as to create higher productivity, higher-paying jobs. Second, strengthen the enforcement of labor standards, including gender equity in employment, with a broad-based strategy that incorporates trade incentives to support creation of decent jobs. And third, consider regulations that slow the speed with which financial capital and foreign direct investment can leave a country. These reforms will promote gender equitable well-being by improving women's entitlements through the state as well as the labor market, thereby promoting gender equality and broad-based social well-being.

## Gender and Microcredit

### Why Microcredit?

Let us start with the basics. Poor men and women need money, first of all, to meet their daily consumption needs. Then there are other requirements as a part of their life cycle that include both normal and crisis times, for regular livelihood as well as for securing some safety net. Earlier, whenever the poor failed to meet these needs out of their own income, they used to borrow from relatives, and when that dried up, they went to moneylenders who levied high interest rates. To alleviate miseries in such a situation, microcredit has been conceived as an intervention in the form of a financial loan from a public

source, given to a group to enable its members to use it for productive purposes. Microcredit and microfinance are sometimes used interchangeably, though strictly speaking, microfinance includes not only credit but also other forms of financial support such as insurance and saving schemes. Mostly, microcredit is administered through self-help groups (SHGs), usually consisting of women coming together voluntarily, registering themselves as a group to avail credit and launch income-generation activities.

The range of life cycle needs is so wide that they require urgent attention. They involve:

- Special events such as weddings, funerals, childbirth, education, home building, widowhood, and old age
- Personal emergency needs related to sickness, injury, unemployment, theft, harassment, and the untimely death of breadwinners
- Disaster-time needs for dealing with fire, flood, drought, earthquakes, cyclones and tsunamis, and human-caused events like war or the destruction of homes in displacement by development projects
- Investment opportunities for expanding or starting a business; buying equipment, raw materials, or land; and housing

To meet all such needs, people without assets tried to rely on their wages or incomes from whatever profession they pursued with their physical labor or skill. Often that fell far short of meeting their needs. For personal needs, they could approach their better-off family members, but for agricultural and entrepreneurial needs, they traditionally went to the moneylender or some private source which became yet another cause of their miseries. The horrendous accounts of exploitation by moneylenders by their usury practices have been widely documented. Paying exorbitant interest rates, mortgaging the homestead land, working on the lender's land as bonded labor, or even working on one's own land mortgaged to the lender were some of the practices. This type of condition of the poor in the developing countries was too well known to need any elaboration. In many countries, banks were called upon to move

in and support the poor by advancing loans. But in all cases, they asked for collaterals that the poor were unable to provide.

It is to address such situations of dire poverty and helplessness of the poor, especially women, that an institutional initiative such as microcredit was conceived. Here the collateral is the collectivity of a group embodying mutual trust or social capital, while considerations such as the availability of suitable raw material, knowledge of skill, and linkage with market are also taken into account.

As has been pointed out in a succinct way by an author, this initiative can be considered to be an "opportunity" to tap the "fortune" at the "bottom of the pyramid" (Prahalad 2004). Microcredit may be regarded as an effective channel to potentially fulfill a range of unmet needs of the poor, not least the need to save for contingencies. If a microenterprise is well designed and successful, it has the potential to meet and exceed the cost of capital. Donor agencies try to target their efforts at generating savings through the investment in microenterprises and spreading it to other activities (Robinson 2001). Since microfinance was seen as having the potential to alleviate poverty and help women's development, the UN declared the year 2005 as "the year of microcredit."

### **Women and Forms of Microcredit**

Many initiatives appeared on the scene in different countries to address this situation. Both non-government organizations (NGOs) and government agencies introduced measures for helping poor women to alleviate their poverty. In India, the Self Employed Women's Association (SEWA), a trade union of women in the informal economy, started the SEWA Cooperative Bank in 1974 to provide loans to low-income, self-employed women. The women themselves saved a little from their low wages and later on took loan from the bank to meet their unmet needs. In the subsequent decades, numerous NGOs came up in India such as the Professional Assistance for Development Action (PRADAN), Center for Youth and Social Development (CYSD), Sa-Dhan, and Bhartiya Samruddhi Finance Ltd. Along with them came up the National Bank for

Agriculture and Rural Development (NABARD), a semigovernmental bank which has been a major source of finance in this category besides being the main agency for many types of agricultural finance in India. In 2001, the Government of India initiated the Swayamsiddha program to empower women's SHGs to avail of both credit and other social sector benefits at the village level. This later became the Rural Livelihood Mission in 2011.

In Indonesia, microcredit was pioneered by the Bank Rakyat Indonesia (BRI) or "people's bank," the country's oldest bank which has been largely state owned during its history of more than a century. In Vietnam, the Vietnam Bank for the Poor, later renamed as Vietnam Bank for Social Policy modeled on Indonesia's BRI, besides the Bank for Agriculture and Rural Development (VBARD) and some other state agencies has been providing microfinance and small credit to individuals, small enterprises, and SHGs. In Bangladesh, before the well-known Grameen Bank was set up in 1983, there was an important initiative, namely, Bangladesh Rural Advance Committee (BRAC), which began as Bangladesh Rehabilitation Committee in 1972 after the country's formation. It is currently renamed as Building Resources Across Communities. An example of a related, but different, kind is a US-based NGO, the Women's Economic Ventures (WEV), active since 1991, giving credit to help single and disadvantaged women to develop microenterprises. Many of these NGOs have targeted the poorest of the poor.

Initially, microcredit initiatives spread like wildfire, and many international NGOs diverted their funds to poor countries to support them. Being lured by the access to easy money, many NGOs in developing countries took advantage of the international sources and started giving quick loans to fulfill the targets assigned to them. The targets were to reach a large number of poor women without caring to check whether the borrowing group satisfied the basic conditions governing microcredit such as availability of raw materials, social capital, and skill. In some cases, slightly well-off women availed the loans from the NGOs working as microfinance institutions (MFIs), and in turn they advanced loans to poorer women at a higher rate of interest. In the process,

the recovery of loans became difficult. In fact, NGOs used various unfair means to recover the loans. It has been pointed out that in Bangladesh, the NGOs sometimes invoked a family's "honor and shame" to recover the loan (Karim 2011).

In 2010, a trend crystalized showing the emergence of a crisis in the MFI sector in India. Unable to repay their agricultural loans, many farmers committed suicide. The norms and practices on microcredit came under intensive review. Many MFIs were blacklisted on charges of violation of rules. After that the Reserve Bank of India took note of the situation and made some rules to regulate the MFIs. First of all, the Reserve Bank set one rate for the commercial Bank which is 26% per year. The second one is for the MFIs which is 10% higher.<sup>1</sup> But in practice in some cases the small MFIs charged 20–60% annual interest to poor clients depending on the situation. Secondly, the tribal women took loans not only from MFIs but also sometimes from the traditional money lenders. At times, simultaneously, all the agents – MFIs, through collateral women and the money lenders – sought recovery of loans. Many farmers, tribal and non-tribal, are driven to commit suicide in such situations. Generally, the collateral women are responsible for ensuring smooth recovery of the loan. If crops did not fail, the poor women from tribal families would be able to repay. In case of crop failure, the pressure of the multiple lending agencies created havoc for the poor families. This situation assumed critical proportion in 2015 in the backward state like Odisha, a state where farmer suicides were rare.<sup>2</sup> This illustrated the negative side of the prevailing credit system with multiple layers.

### Debating Microcredit: Has It Empowered Women?

Now we come to the crucial question as to whether microcredit as a policy instrument has

liberated women from various structural constraints by empowering them financially, politically, and socially or has it touched them only superficially. Does it indicate that the state has abdicated its welfare role in alleviating poverty and gender injustice in favor of NGOs or does the state still play an important role in this respect?

Critics have observed that microcredit had done very little for poor women. They have cited evidence to show that while launching microcredit programs, the state had cut down allocations for welfare schemes. In turn NGOs/MFIs took over that responsibility, and, operating on market principle, they sought to make high profit imposing high interest rates on the clients. As a result, the women's interests were compromised. Hence the whole purpose of the microcredit was lost. In fact, they cite the crisis in microcredit sector in 2010 to vindicate their point.

High rate of repayment and dependence on the existing financial institutions of the market have been seen as actually harmful to women's empowerment. One author terms it as "feminization of capitalist modernity" (Fernando 2005).

Observers have critiqued the activities of Grameen Bank and BRAC of Bangladesh showing how these NGOs had taken over the role of state by building roads and offering education and after assuming the major role in managing microcredit have assumed more power for themselves accentuating conditions of inequality. These NGOs became more interested in maximizing profits rather than helping the poor. The women who take money from them also operate within the close network of kinship of the family. In most cases, even though they take money from the NGOs, they hand over the same to their husbands who in turn manage it and give the installment. In case the women fail to repay, besides invoking family "honor and shame," the agents who are invariably tough-looking male resorted to a variety of coercive and manipulative means to secure repayment. The poor women being unable to pay often lose their only asset, namely, the thatched houses or even a cow to repay the loan. In other cases women from lower middle class used mobile phones to facilitate the operations by collecting information on the fair price of the product. But instead of helping the poor by this,

they charged the latter for the use of mobile and thus made money at the cost of the poor. Thus, critics argued that microcredit hardly challenged patriarchy, rather it operated microcredit within the prevailing patriarchal system even using women against women (Karim 2011).

However, the reality is more complex. While this depicts one side of the story, it fails to recognize how women used even small credit and collectivity of their action to enlarge political and economic space. This is what we will take up next.

Even when there were trends indicating a retreat of the welfare state and rise of profit-oriented NGOs, there were compulsive historical forces requiring a positive role of the state as well as NGOs to respond to social development goals. In that context, women availed the opportunity to form women's collective and fight for their rights in various ways.

For example, the fully state-owned successful microcredit program in India known as *Kudumbashree* (prosperity of the family) has been working since 1998 in Kerala. It is a federation of women self-help groups. These women get loans from the state government to earn additional income. Besides manifold income-generation activities, they are also involved in state-run activities such as conducting social audit of the largest right-based rural employment guarantee scheme all over the state. Having gained the SHG experience, they move on to undertake multiple roles in society, politics, and economy. Many of these women get elected as leaders by contesting for offices in the local government institutions both rural and urban. Thus, they are engaged in the delivery of various public goods such as low-cost shelter, sanitation, drinking water, etc.<sup>3</sup>

<sup>3</sup>Incidentally the Seventy-Third Constitution Amendment Act was passed in 1993 reserving not less than one-third seats for women both at the membership and headship level. The objective of the Act is to bring participatory, transparent governance to the doorstep of the villagers in which they have a say and, secondly, to enable women to participate in the decision-making process which would improve their image in the public sphere. The above Act enabled a large number of women to get elected. Many welfare schemes such as drinking water, sanitation, and low-cost shelter are implemented and monitored through the local government. These women's collective thus improve the good governance.

Extensive evaluations of this program have shown that these women groups had proved themselves in practice as important agents of social change achieving economic as well as social objectives (Oommen 2010).

Similarly, a study of the experiment of women SHGs in Andhra Pradesh concludes that rather than focus on the successful repayment of loans, one should note the value of the political experience women gained through their involvement in the entire process of utilizing the microcredit. Taking part in the consultations and decision-making within the SHG about utilizing the loan and planning repayment was extremely important (Finnis 2017). These activities can be understood as expanding the empowerment of the individual and the agency of the group. In a particular case, the members decided to use the loan to improve the connectivity to the village by constructing a road so that a doctor could come to serve the village. By completing the road, the group not only felt empowered but could also improve the welfare of the villagers. Thus, in spite of facing inequalities in the everyday lives, the women could utilize the funds in the desired way, and this itself had long-term implications for positive social change.

NGOs like the Mysore Resettlement and Development Agency (MYRADA) or Development of Humane Action Foundation (DHAN) and SEWA are conspicuous for the fact that they did not succumb to the market crisis in 2010. They showed as one scholar has put it, “the importance of the power of communities in resolving issues that can’t be solved by market and the state institutions” (Sharma 2011, 60). As we have mentioned earlier, SEWA fights for the rights of the self-employed women. The NGOs enable the scheduled caste (formerly untouchable castes of India) and scheduled tribe (tribes listed for special welfare support) women to form collectives to lobby in the public space to pressurize state and local bodies for improving irrigation facilities, electricity supply, and other utilities. They also look after health needs such as sending pregnant women to the hospital, undertaking immunization of the children, etc. (Ghosh et al. 2011).

The remarkable achievement of Bangladesh in literacy as well as life expectancy of females may not be unconnected with the extensive role that NGOs have played in the country with microcredit being a major component of their activities. Infant mortality and maternal mortality rates have declined, and all these may be partly connected with the women’s participation in the microcredit program. On the top of all this, in spite of having a lower per capita income than India, the rank of Bangladesh is much above India in HDI (Human Development Index) as well as GDI (Gender Development Index). Amartya Sen has frequently highlighted this. He attributed the achievement largely to the imaginative initiative of Grameen Bank and BRAC along with many welfare-oriented government policies (Sen 2011).

Thus, it is noticed that neither has the state withdrawn fully nor are the NGOs engaged only in maximizing their profit at the cost of poor women. Enabled by the provisions of local government institutions and that of microcredit, poor women could form women’s collective to improve their bargaining power and raise their status in the public sphere in addition to achieving concrete livelihood needs. In the process, the women become decision-makers even if in a small way. It is true that this by itself does not lead to fundamental social transformation of the patriarchal order. For that we need to undertake many long-term structural measures providing much more access of women to productive assets along with education and health and above all change the cultural attitude of people. Otherwise, despite the improvement in their status, the women continue to face violence against them. In other words, microcredit is not a “magic bullet.” Along with this, one needs other enabling social, economic, political, and cultural factors to empower them substantially.

financial security and well-being of the population, including family policy, housing, education and early childhood programs, health, and income security policy. These are labeled social policy, which is often demarcated from economic policy, though the two overlap. Clearly each of these policy areas has clear economic impacts, and many aspects of social policy are social investments that maintain and enhance the quality of the labor force and develop the next generation. Research on social security and social programs occurs in a range of disciplines, including sociology, economics, social work, education, and health. The starting point for a gender analysis of social security and social programs is that these policies are often framed as gender neutral or gender blind, when in fact the underlying assumptions and impacts are highly gendered. Furthermore, academic analysis may fail to use a gender lens, whether in conceptualizations of the overall welfare state or evaluations of specific policy areas.

Feminist scholars have been particularly active in (re)examining social policy from a gender perspective.

## Social Security Through a Gender Lens

While feminists may frame the issues differently across disciplines or policy areas, a common point of departure is that gender inequality in the labor market and the household results in different social security risks and entitlements for men and women. For example, women are more likely to be in precarious jobs or have discontinuous paid work, which reduces their entitlements to employment-based income security programs such as employment insurance, pensions, and health insurance. These employment-based programs form the top tier of social security systems in many countries, with lesser entitlements for others. Women's entitlements are often based on their roles as wives and mothers. The hierarchy of entitlements is also linked to the underlying separation

## Definitions/Introduction

Social security and social programs refer to several areas of government policy that support the

of the paid (production in the market) and unpaid (social reproduction outside the market) economies and the invisibility of the latter. The work of women in unpaid caregiving is also linked to the devaluation of care work in the market, which further affects entitlements. Evidence in many countries shows that women's entitlements to pensions, employment insurance, and other income security programs are affected by their responsibilities for social reproduction (MacDonald 1998). Risks also differ by gender. Those in precarious employment face higher risk of income inadequacy or job loss; wives face higher risk of income loss from divorce than husbands; single mothers have higher rates of poverty. Health risks also differ by gender, which is a problem if research results from samples of one gender are generalized to the whole population.

At a system level social security and social programs mirror and reinforce gender roles and gender inequality. Welfare states differ by the underlying gender regime or gender contract. Conceptualizations include the male breadwinner model, where women are responsible for unpaid work in the home and are dependent on spouses for income security (with social security policies primarily linked to the paid work of the male breadwinner); the universal earner (or adult worker) model where both spouses are expected to work and social policy is based on a norm of active labor force participation by all adults; and the parental model, where social security is provided for children regardless of parental work status (MacDonald 1998). These models can be clearly seen in family policy, both in terms of financial benefits and services. For example, are income benefits for children universal (parental model) or are they targeted only to the poorest children (male breadwinner model)? Are early childhood programs framed as supporting working parents (universal earner model) or investing in the development of children (parental model)? Do schools provide lunch and after school programs (universal earner model), or are children sent home (male breadwinner model). Similar differences exist in income and service policies

for the elderly. A gender analysis highlights how caregiving in all its forms (children, elderly, sick) is organized and the implications for the financial security, health, and well-being of the carers, be they paid or unpaid workers.

A gender perspective on social security and social programs draws attention to broader questions of what is valued in society and how economic resources are distributed and redistributed. What is considered a contribution to society and an economic investment? Is public spending on early childhood education a drain on the economy or a social investment? Should social programs be universal, in that they provide benefits to the whole society, or targeted only to those in need? Who are considered as deserving and undeserving of financial assistance? Who is expected to engage in paid work and who is deserving of public support for unpaid contributions? Do stay at home moms need childcare programs?

At the level of individual programs and policies a gender analysis asks what are the underlying gender assumptions and likely gender impacts. For example, parental leave policies in many countries are biased toward mothers taking the leave, reinforcing a traditional gender division of labor around childcare with resulting consequences for careers. Standard economic criteria for policy evaluation need to be reconsidered from a gender perspective (Himmelweit 2002). Equity usually focuses on horizontal and vertical equity, but to this is added gender equity. Economists often argue that targeting programs is an efficient use of limited resources, but gender considerations complicate that evaluation. For example, many programs use the household as the unit of consideration, but feminist analysis draws attention to intrahousehold inequality. Thus, it may be problematic to use household measures in means or needs testing to target programs. Individual entitlements to social security benefits are important. Similarly, research has shown that it matters who in a household receives income in terms of how it is spent. Thus, outcomes differ if child benefits are paid to the mother or the father (MacDonald 1998). Social security policy has a role to play in redistributing resources *within*

households as well as *between* them. Conditional transfers have become popular in a development context as a way of improving the health and education of poor children. However, from a gender perspective, these may contribute to inequality. When child benefits are conditional on school attendance or medical services, the traditional role of mother is reinforced, limiting her ability to be economically independent (Molyneux 2009). In general, policies need to be evaluated for their impacts on the gender division of labor and intrahousehold inequality.

Social security policies may also privilege certain family arrangements over others, whether intentionally or not. This is especially the case in welfare states based on a male breadwinner model, where policies reinforce the patriarchal family. Support for single women may be minimal. Women have few claims on such a system except through marriage. Lone mothers are traditionally covered by social assistance, but the amounts are typically low and stigma is attached to being outside the “normal” family in many countries. Tax policies that allow income splitting also favor married over single individuals.

Social security policies and social programs can also shift resources between the paid and unpaid economies (Himmelweit 2002). False efficiencies or cost savings are achieved when work that was done for pay moves to the home and typically to women. Examples include early hospital discharges and other forms of deinstitutionalization. Not only does women’s unpaid workload increase, with impacts on stress and well-being, but their ability to participate in the paid economy is undermined. These costs are usually invisible to policy makers and the public. Gender budgeting is one way to track the real costs and benefits of government programs and to show differences by gender in the distribution of those costs and benefits (Elson 2006).

While social security policies and social programs typically reinforce gender norms and inequality, a gender analysis points to ways policies can be structured to help promote equality.

For example, in terms of child-related leaves, many countries have moved from maternity leave only to parental leave that can be shared, and to father-only leave, with the aim of increasing the uptake by fathers and altering the division of labor around care and paid work. At the same time, women’s rights to decent social protection in their traditional roles needs also to be promoted, such as better employment insurance access for precarious workers, or pension credits or other compensation for time spent doing unpaid caregiving. A basic annual income is one way to support the many ways people contribute to society. For many feminists, the goal is to promote more equal access to income-earning opportunities and equal sharing of caregiving and other unpaid labor. Social security policies are one tool for achieving this.

## Gender and the Economic Theory of the Firm

### Definition/Introduction

According to the mainstream economic theory of the firm, the sole purpose of a business is to maximize profits or shareholder wealth. Research pointing the gendered nature of this ideology offers alternative approaches that have significant implications for the field of business ethics and for the professional ethics of economists.

### Masculinist Bias in the Theory of the Firm

The theory of the firm propounded by mainstream (neoclassical) economic theory has been increasingly adopted by management educators, the business media, and policymakers, as well as by academics who take a critical stance towards business. In that theory, the essence of the firm is assumed to be profit maximization. Against the backdrop of this increasingly popular belief, an explicit concern with ethics (beyond, perhaps, a minimal concern with legality) is often considered to be at best a weak add-on to, or at worst a distraction from, the underlying “principles” of capitalism and business.

Beginning in the 1990s, scholars began to notice the masculine-biased nature of these suppositions. Feminist economists pointed out that neoclassical economic theory is centered around

notions of reason, self-interest, competition, and mechanism – all culturally associated with masculinity. Meanwhile, the theory radically downplays the roles played in economic life by emotion, a concern for ethics and for the well-being of others, cooperation, and sociality (Ferber and Nelson 1993).

### Developments in Gender and Business Ethics

A first exploration into the implications of this recognition of gender bias for the field of business ethics was taken by contributors to Larson and Freeman (1997). Emphasis was particularly placed on the roles played by relationality and cooperation in business behavior and business management, which had been overlooked in the neoclassical account.

Some of the subsequent analyses within the field of business ethics, however, have associated relationality and cooperation only with women. Remaining within a gender binary, they have adopted sharply delineated notions of “masculine” and “feminine” characteristics and assumed a tight association between these and embodied men and women. In particular, the notion that women are naturally more caring, while men are naturally more interested in efficiency and finance – or, at most, in ethics centered around notions of impartial justice – has become widely popular. Some have proposed a “feminine” firm as an alternative to the sort of firm posited by masculinist neoclassical theory. Many have hypothesized that firms led by larger numbers of women would act in more ethical and caring ways.

Others, however, point out that such an approach is neither empirically grounded nor feminist. Noting that the hypothesized tight association of women with care ethics does not hold empirically, they have called such binary thinking into question. They point out that the field of feminist ethics is more liberatory than, and should not be identified merely with, care ethics alone (e.g., Borgerson 2007).

## Developments in Feminist Economics

Meanwhile, analysis by feminist economists has demonstrated that the mechanical theory of the firm arose – not from the study of actual firms or the study of law – but from an ambition of the economics profession to emulate the “hard” sciences, such as physics, and avoid denigrated (and feminine-associated) “softness” and messiness. Yet characteristics long neglected by the received economic dogma – including a concern with ethics – are in fact essential to long-term success of firms, and a more encompassing theory of the firm better meets standards of scholarly rigor (Nelson 2003, 2016).

Inherent in the mainstream economics model of the firm are a number of contradictions. On the one hand, the firm is regarded as purely autonomous – as a unitary, rational, decision-maker independent from its social and physical environments. This echoes stereotypes of masculine activity and power. Yet is it also, in the core theory built around the image of perfectly competitive markets, assumed to be purely market-driven, having no choice but to profit-maximize. This reflects stereotypes of feminine passivity and weakness. Similarly, within the firm, individuals are sometimes pictured as *homo economicus*, that is, as independent actors who make rational, self-interested choices. Yet, when treating the firm as unitary decision-maker, those inside it are treated as mindless direction-followers, willing to single-mindedly serve the shareholders in return for a paycheck (Nelson 2003).

An alternative model of firms as “individuals-in-relation” avoids the contradictions inherent in relying on old, gendered, dualistic notions of either complete independence or complete dependence. This alternative model incorporates a recognition of the interdependence of organizations and individuals, and it allows a recognition of individuals as human beings with complex motivations and an ability to manage complicated responsibilities within social settings (Nelson 2003). It opens a space for discussing meaningful (including ethical) choices.

The feminist critique also offers a potentially more useful alternative to current practices than do many “critical” or left-leaning academic

theories that, like neoclassical economics, theorize capitalism in terms borrowed from physics (e.g., “laws,” “drives,” and “forces”). Such mechanical metaphors reflect masculinist biases, while convincing many scholars on the left that a direct concern with ethics is impossible within capitalism. This widens rifts in spheres of academia and advocacy, and cuts off what might otherwise be useful discussions about the appropriate scope of business responsibilities (Nelson 2016).

The rising influence of the economic theory of shareholder value maximization – and its accompanying outgrowths including principal-agent theory – has played an important role in troubling developments since the 1980s. Businesses have become increasingly financialized and commodified, with many being bought, sold, or taken over with no attention given to any concerns beyond short-term financial performance. The widening gap between the incomes of the top 1% of earners and the rest of the population in some countries can be at least in part traced to economic theories about the need to properly “incentivize” executives in order to get them to serve shareholders. The feminist critique of the shareholder value maximization project thus raises serious questions about the professional ethics of practicing economists, given the harm done by the promulgation of this ideology (Nelson 2016).

## Conclusion

Feminist theory, by questioning the gender-biased neoclassical economic theory of the firm, suggests that business ethics should be brought out of the margin of management scholarship and into its core and that the professional responsibilities of economists are in need of serious review.

## Gender Gap in College Enrollment

## Introduction

The gender gap is the difference between women and men as reflected in social, political, intellectual, cultural, or economic attainments or attitudes (World Economic Forum). The old gender gap favoring men in college enrollment in the United States, which persisted for over 300 years, has reversed course in the past four decades. Before the 1970s, men outnumbered women in higher education. In the early 1980s, women outpaced men in college enrollment and completion for the first time. Today, approximately 57% of US college students are women (Aud et al. 2012). The new gender gap is the fact that female enrollment in post-secondary education is greater than that of males.

## The Old Gender Gap

Until the early 1990s, public concern focused on female disadvantages in education. The American Association of University Women (AAUW) reports that schooling environments that do not consider girls' special issues, including those associated with their physical and mental development, put girls at a disadvantage in the race to college. In the classroom, girls received less attention from teachers than boys did. Teachers gave more esteem-building encouragement to boys while girls received fewer and lower-quality comments from teachers. Teachers also chose classroom activities that appealed more to boys' interests. Teaching methods emphasized competition, which is in boys' favor. Curriculum did not address central issues in female students' lives such as teen pregnancy, eating disorders, depression, and self-esteem drop. A partial explanation for these problems is the lack of women in the leadership of public education. Less than 30% of principals are female and less than 5% of superintendents are female. Furthermore, out of the ten books most frequently assigned in public high schools, only one was written by a woman.

Social expectations for women create huge obstacles for girls. Traditional gender role beliefs support women's role as the caretaker at home and in the family (Dicke et al. 2019). The AAUW reports that 37% of girls, compared to 5% of boys, drop out when families have difficulties. Traditional gender roles expect the female to help. Women who do enroll in college are less likely to enter the labor force when married because of the traditional expectation that they will stay at home as caretakers. The low economic return in female education thus further discourages female college enrollment. Furthermore, it is a common belief that women are less competent than men in the workplace. The belief leads to less investment in education for girls. Labor market discrimination against girls, such as lower female participation and lower wages for females, also partially explains lower investment in education for girls. Pregnancy is another reason for girls to drop out of school. Unfortunately, sexual harassment of girls by boys in school is increasing.

## The New Gender Gap

The new gender gap, depicted as a “stunning reversal,” has received increasing attention (Conlin 2003). Today, young women are more likely to enroll in, and graduate from, college than young men. The new gender gap exists across most socioeconomic groups. Low-income and minority groups even have wider gaps. The number of females and males entering high school is equal. However, more girls are graduating than boys; more women enroll and graduate from college than men.

Social reinforcement theory holds that individuals do more of what they like or are rewarded for, and less of what they do not like or are punished for. Public efforts to correct the old gender gap resulted in changes that made girls more competitive in primary and secondary schools so as to increase female enrollment in higher education (Adebayo 2008). These changes often disregard the needs of boys. Boys report more negative experiences and more behavioral problems in schools. Curriculum favors female learning preferences but has unintentional negative effects on men. In addition, the increasing number of girls in school with better achievement leads to bias stigma that doing well in school is a “girly” thing. Female students are well-prepared for college with both cognitive and noncognitive skills. They have better GPAs, standardized test scores, career aspirations, and career plans. College admission policies focused on top grade point averages, a strong curriculum, high class rank, and high-test scores skew toward female students.

Human capital theory suggests that education or training can raise the productivity of workers by providing useful knowledge and/or skills, therefore raising workers’ income by improving their lifetime earnings. College earnings differentials rose faster for women than men in the eighties. For this reason, it is likely that women value college education more than men. Beyond economic return, women also believe that higher education provides a higher probability of marriage, a higher standard of living, and insurance against poverty (Buchmann and DiPrete 2006). Furthermore, the blue-collar jobs that pay best are male-dominated. Those skilled blue-collar

labor markets do not welcome females. Not only it is difficult to enter, but also there is a low chance of promotion to highly paid positions.

The women’s movement has changed gender role expectations. The movement focused on expanding opportunities for girls and women. The introduction of birth control and its effect on delaying marriage and childbearing encouraged more women to enter college. Popular culture and social norms promote an image of masculinity that glorifies athletics, celebrity, risky behavior, and wealth while demeaning hard work and academic achievement. Thus, boys aspire to “dream careers” that do not require college degrees but promise high earnings such as professional sports, music, or the video game industry (Kleinfeld 2009). Although the number of blue-collar jobs that have high earnings has decreased, boys still find male seniors around them hold high-earning jobs without college degrees. This has a negative impact on male enrollment in college.

## Discussion

Gender equality is a human right. Globally, the gender gap is favoring men. Women have less opportunity in economic participation, less access education, and greater health and safety risks. Policies to fix the old gender gap in college enrollment, however, create the new gender gap. Regardless the advantages in higher education, women still face inferior social and economic status. Thus, research and policies to address the boy’s issues need to be done in a systematic way to avoid the return of the old gender gap.

## Gender Policies on the Board of Directors and Firms Financial Performance

### Introduction

Gender equality in all fields, and, of course, in Economics, is a primary aim at the international level. In this sense, the fifth goal of the United Nations' 2030 Agenda establishes that it is a fundamental human right and whose implementation is essential in pursuit of a peaceful, prosperous, and sustainable world.

In developed countries, it remains a real, but no legal, gender gap. The different traditional roles attributed to men and women are still deeply

rooted in their cultures. The gender gap is even more severe in managerial positions than in staff workers, where men use to hold an overwhelming majority. Intending to promote gender equality in the decision-making processes, the European Commission recommended that member states developed governance initiatives and legal rules to increase the percentage of women on board of directors. The issue is that not all countries have enacted laws to establish gender quotas.

Moreover, this legislation is not always mandatory and, in many cases, there are no sanctions for noncompliance. Therefore, the effect of such as regulations is still not as it should be expected. Furthermore, the laws usually involve public and listed companies, so the female presence on corporate boards is even lower in small and medium-sized firms.

The mandatory laws have provoked some controversial opinions. People allege that firms must hire employees by their abilities, academic background, and experience and not because of their sex. Otherwise, a company might suffer a loss in its profitability. This argument is valid, but it is also true that there are women with enough capability to belong to corporate boards. Women usually have to exhibit superior curricula that their male counterparts; however, they are excluded due to their gender. The scarce traditional presence of women on corporate boards is due to the so-called *glass ceiling*. This invisible cultural barrier restrains well educated and trained women from holding responsibilities in organizational positions. Lately, it is also known as the *concrete ceiling*, which indicates the difficulty to break it.

The systematic exclusion of women in managerial positions damages companies since women, numerically speaking, make half of society, which leads to suboptimal boards of directors. Women have distinctive characteristics that differentiate them from men. The heterogeneous groups are more efficient and obtain synergies that benefit companies, as outlined below.

From an ethical point of view, gender equality is an uncontested goal. However, companies need economic reasons to increase the number of women on their boards, and policymakers would

be less questionable if they had strong reasons to impose gender quotas.

In the last decades, there has been a stream of empirical research on the beneficial female presence in upper management scales, which provides solid arguments to support legal initiatives and to convince shareholders of the interest of contracting a higher percentage of women as directors. Much of these analyses state that the increasing presence on corporate boards involves a better financial performance in the companies. Next, the basis of this argument will be set out.

### **Gender Diversity on Board of Directors and Company Financial Performance**

The primary decision-making and representation body of a company is the board of directors. It institutes the tasks, goals, policies, and strategies that will lead the corporation's activities. Besides, it monitors the CEO and department managers. Thus, the specific features of company board members, such as education, experience, any background, nationality, age, or gender, could determine financial performance.

Our focus of interest, that is, gender diversity, represents a controversial issue. It supposes some pitfalls, but also entails substantive benefits. On the one hand, when groups are homogeneous, the dialogue used to be more frequent and fluid, the opinions are less divergent, which involves limited conflicts, so the decision-making process will reveal more effective since it will be less time-consuming. Furthermore, when females occupy a relevant position on the board because of their sex, men could consider them as *tokens*, ignoring their opinions on the board, which would lead to interpersonal confrontations and a substantive delay in decision-making. Therefore, the effectiveness of the board as a whole could decrease, and, consequently, the financial performance might diminish. On the other hand, the different qualification and experience of the heterogeneous group result in different perspectives, involving a more understanding exploration of events, which reduces premature decisions, through the

contemplation of alternative, creative, and innovative solutions for challenging problems.

Literature shows that women are different from men because of their nature and personal nurture. At the purely biological level, men and women's brains do not function equally in the situation of risk in decision-making processes. Hormonally, testosterone makes men more prone to risk, while oxytocin makes women more stable in times of uncertainty. In competitive conditions, a man's testosterone levels rise, increasing his muscle capacity, which increases his oxygen level and makes man increase his risk appetite. However, the steroids have an inverted U-shaped curve and when testosterone peaks and slides to the other side, men begin to misbehave and increase impulsiveness, which impairs decision-making. Conversely, women are affected by the stability of oxytocin, which is emotional stability that floods their brain in more significant quantities than men. Thus, women can be considered more stable in terms of uncertainty and stress levels, and consequently, less susceptible to take a risk (Van Staveren 2014).

Moreover, literature ponders that women are more sensitive to social and environmental problems, increasing the company's corporate social responsibility (Valls Martínez et al. 2019, 2020). Additionally, women have a more participative and democratic leadership style, higher ethical judgment, and philanthropy. They exhibit a better understanding of the markets since their relationship with customers, suppliers, and organizations is smoother. Women tend to exhibit more moral than men. Their presence reinforces the independence of boards, fosters internal and external auditing duties, and reduces earnings-management practices and controversies. They attend the claims of different stakeholders more effectively due to their higher level of empathy (Francoeur et al. 2019).

Furthermore, the female presence in the board of directors improves the external legitimacy and reputation of the company since it is a distinctive sign of equality, positively assessed by investors.

There are many empirical studies concerning the influence of a higher percentage of women on board of directors on the company's financial

performance. Most of them conclude that there exists a positive link between the two variables, but some analysis found a negative or null relationship (Post and Byron 2015). Indeed, when the study is recent, and the sample corresponds to a developed country, the result is usually positive. In these cases, the percentage of women is relevant, and women can exert influence. Furthermore, years ago, it was difficult for women to access managerial positions. Likewise, in developing countries, there are a limited number of female directors. Consequently, if the number of women is almost residual, their influence cannot be significant.

## Theoretical Framework

The explanation of why women's presence on boards of directors increases the company's financial performance can be argued according to several management theories, which are explained below.

The best known is the *agency theory*, which establishes that there are two groups with conflicting interest: principals and agents. The shareholders (principals) are the owners of the company and aim to maximize its value. The managers (agents) make the decisions, but they could act on their benefit and against the general interest of the shareholders (Fama and Jensen 1983). To prevent such as adverse decisions, principals should order internal and external audits or could incentivize managers by sharing ownership of the company. This control would imply costs, which are called agency costs. The role played by the company board in this context is substantial to control and monitor managerial actions. A diverse board can exert a more effective control since the skills, background, and knowledge of their member are broader than if the board is homogeneous. Besides, the more independent is the board of directors, the more improve the control tasks. It is essential to highlight that women are mostly independent members on boards of directors, with weaker links to the managers than their insider counterparts. Therefore, women bring more independence to the company board and

enable more reliable monitoring, which reduces agency costs and, consequently, increases the company's performance.

*Stakeholder theory* considers that not only are the shareholders concerned about the company but other stakeholders, such as customers, suppliers, investors, governments, and the general society, are also interested in the company's activities and its consequences. Gender diverse boards are more willing to attend the stakeholders' claims faster and effectively, which in turn is beneficial for the company since it reduces conflicts and increases its social acceptance (Hillman and Keim 2001).

A reputable theory to explain the positive relationship between the ratio of women on corporate boards and the company's financial performance is the *resource dependence theory*. The board itself is a fundamental resource for the firm. Board members are closely related to the environment. They afford information, create channels of communication with relevant stakeholders, and lastly, legitimize the company (Lückerath-Rovers 2013). All of this could involve a sustainable competitive advantage, not imitable by competitors.

Moreover, women might supply new resources to the company, through their in-deep knowledge of the market and access to diverse credit sources. Consequently, the company performance could increase by their presence and the labor they made. Furthermore, the presence of female directors is evidencing to society that corporation accomplishes with gender equality, which fosters the external legitimacy of the entity that brings higher performance (e.g., customers have a better acceptance of the products or the shares are more desirable for investors).

A high number of companies have commercial relations with the governments in all countries. When laws promoting gender equality exist, a specific percentage of female directors must be in a priority position for government contracts. The company is penalized if it does not accomplish the legal quota of women. Therefore, women directors positively influence on the firm's financial performance.

Finally, the *resource-based view* states that gender diversity is a source of competitive advantage. The human team is not perfectly imitable and, therefore, not strategically replaceable. This circumstance indicates that the ratio of women/men on the company board is a singular source of value for the company (Shrader et al. 2020).

## Conclusions

Gender policies in all areas, and especially those relating to the composition of company boards, involve an inherent debate between those who are in favor of legislating to achieve real equality between men and women, and those who openly reject them, arguing that companies should be free to recruit whoever they consider appropriate. Indeed, companies are not responsible for social change and so, they must generate benefits with such policies. Researches are conscious and perform empirical analyses to find financial advantages derived from legal impositions (Valls Martínez and Cruz Rambaud 2019).

Hitherto, the results are mixed, but most of them establish a positive relationship between the higher percentage of women on board of directors and firm financial performance. Nevertheless, it is essential to define what financial performance could be identified with both accounting measures of profitability and the company's market valuation. When accounting measures are taken into account, it is more frequent a lack of relationship. However, when Tobin's Q, or other market valuation measures, are considered, the influence of women is evident.

Why this disparity? From a theoretical point of view, women reveal different moral reasoning and skills than men, and two sexes are complementary, which brings added value to the companies. The presence of women in senior management may not always bring the desired economic increase, valued in monetary units, but the market does value it positively. Indeed, investors prefer those companies with greater legitimacy. Profitability is an unquestioned condition, but it is no longer sufficient. Nowadays, investment rewards companies that help keep human evolution going

and are ethical because ethics is the most ecological good that humanity has, protecting people and his environment. Currently, the investment aims social and environmental awareness, which requires gender parity in companies.

Policymakers should promote the presence of women in top managerial positions since it involves both financial and nonfinancial interests. Even if female participation in management positions were not to affect financial performance, as long as the higher percentage of women does not produce a detrimental effect on firm performance, laws should impose an increase in the presence of women for ethical reasons.

Nevertheless, legal rules are not enough. There are also necessary educational policies, which are fundamental to progress. Parity between men and women will only be achieved if it starts from the bottom line, when children are in time to be educated, enhancing their capacity to be leaders working as an equal. Indeed, the change of mentality will take time because it is a process that requires a complete generational change. That is why, until that time arrives, institutional support measures are urgently needed. In developed countries, women have the appropriate educational level, but they need legal support to enhance their training. It is necessary to mention that, at the managerial level, women are usually assigned to roles related to corporate social responsibility areas, as well as human resources, marketing or audit committees, but they are relegated to financial positions. That implies clear and unjustifiable discrimination against women. Women are prevented from accessing specific works, which blocks their well-deserved access to the board of directors.

Moreover, to ensure that equality becomes possible, legal initiatives must be taken to balance work and family life. Why Norway is the country with a long tradition in gender equality? The answer is simple: because reconciliation measures have long been more advanced than in most other countries.

Investment is beginning to be guided by the practice of real equality policies in companies. In the same way that investment in nonpolluting companies or which deny abusive practices such

as the employment of children in manufacturing companies are under the scope of the contemporary investors, the attention of markets is increasingly focused on gender equality. For this evident reason, the financial markets, as a whole, take a very positive view of companies with more women on board of directors.

## Gender, Economics, and Unpaid Work

## Synonyms

Domestic labor and care; Household production; Non-market work

## Introduction

To understand work from a gender perspective, it is essential to acknowledge and value both paid employment and unpaid work. Paid employment garners wages; unpaid work is the production of goods or services that are consumed by those within or outside a household, but not for sale in the market (OECD 2016). Unpaid work includes housework, home maintenance, gardening, crop growing, and caring for children, elders, and those who are sick or are living with a disability. It is productive activity that contributes to the wealth of nations and the economic welfare and well-being of households, but is not remunerated. Because the distribution of labor reflects and creates financial disparity, how market and non-market work is divided by gender is a critical social issue.

## **Paid Work and Unpaid Work Are Both Productive**

Unpaid work activities fulfill many important functions that directly affect the well-being, economic security, and quality of people's lives. Yet because it is conducted outside the market, unpaid work is marginalized in most methods of measuring economic activity and is largely invisible to conventional economic accounting. The economic sidelining of unpaid work is long-standing. During industrialization, paid and unpaid labor became spatially differentiated and gender differences accentuated. Men worked for money outside the home; women's domestic production and mothering roles largely remained in the home. Work came to be defined as only those activities which resulted in the production of goods and services that were sold. Because unpaid work was not exchanged for money, it was not widely recognized as being "real" work (Folbre 2001), despite the crucial role it plays in underpinning the economy and perpetuating the society. Domestic labor and family care are not simply family or personal matters. They have benefits that extend to the whole of society because to function successfully, societies depend not only on the market economy but also on an adequate supply of unpaid work and family care (Fineman 2004).

Paid and unpaid work were seen as the province of men and women, respectively, so the gendered division of labor underpinned the economic vulnerability of women. In money-based economies, there are substantial personal costs to undertaking labor outside of monetary exchange. Performing domestic work and care constrains the ability to do other activities, including work for pay, and entrenches disadvantage. This continues even in the face of higher female workforce participation. Growing rewards in the labor market raise the opportunity cost of withdrawing from the workforce to care for family members; fewer people are able to do it, and, as a result, both the supply of unpaid care and the well-being and financial security of those who still provide it are jeopardized. For example, people who withdraw from paid work to care for children or others may

lose income not only in the short term but also suffer cumulative material disadvantage over the lifetime through lost access to promotion opportunities, retirement income, and health funds. Conversely, if carers do not withdraw from the workforce, they may be subject to overwork and time strain. Currently, even as more women take on paid employment, they continue to perform the bulk of unpaid domestic labor, so are under more time pressure, at detriment to their health and well-being.

Thus, being disproportionately responsible for unpaid work is a life-course risk, and it is important to make it visible alongside paid work and quantify its social and economic worth. Knowing how much is done, who does it, and the consequences for those who do it, is prerequisite to understanding contemporary gender equality and barriers to it.

## **Making Unpaid Work Visible**

The primary data sources for measuring unpaid domestic work are time-use surveys. To give a fuller picture of the size of national economies, the United Nations advocates using time-use surveys to calculate the quantum of nonmarket work and compile satellite accounts to supplement calculations of gross domestic product (GDP). Satellite accounts refer to measures of the size of economic sectors that are not defined as industries in national accounts (e.g., unpaid work, tourism, the environment). Time-use surveys collect diary records of all the activities respondents do throughout the day. They provide the most accurate current estimates of all unpaid work and family care that takes place in society and give an otherwise unavailable statistical picture of unpaid domestic labor in the home. Empirical analysis of the time-diary surveys can show the magnitude of the time inputs to this work and, if a value is ascribed, its worth in money.

There is some debate over how to precisely define unpaid work. One definition is that work is any activity that creates a benefit for someone else. Another yardstick is the third-party criterion.

This defines work as any activity you could, in principle, pay someone else to do for you without losing the benefit of it. For example, you could pay someone to cook a meal for you, but not to eat it for you. Therefore, cooking is work but eating is not. Unpaid care work, which includes childcare, eldercare, and care of the sick and disabled, does not precisely meet this criterion, as a personal relationship is to some extent intrinsic to the task. It involves close personal and emotional interaction with others. Neoclassical economics is based upon a set of underlying assumptions about human behavior, including the idea that people act rationally in their own interests and choose to participate in activities they prefer. This framing obscures care provision even more than other domestic labor because it is regarded as done by choice, for the individual benefits it brings to those who perform it. For example, neoclassical economics conceptualizes raising children as a leisure activity undertaken for the personal pleasure it gives the parent; it is a form of consumption (Becker 1991). This view sidelines issues of constraint, feelings of obligation, and differences in power, which underpin gender gaps in the division of paid and unpaid work. Feminist economists contend that work should be defined as activities that generate benefits for others extra to any intrinsic pleasure derived, and note that care, including child-raising, creates such transferable benefits (Folbre 2001).

A practical question is what value to ascribe to unpaid domestic work. The two main approaches are the input method and the output method. The output method gives a value equivalent to what would be paid for a product or service commercially. For example, it can be set at the amount a homemade dress or meal would cost to buy in a shop or restaurant. This method is only possible when there are material products of unpaid work, however. The input method values time spent in a given activity at an imputed wage rate. Tasks such as looking after children, housework, gardening, chauffeuring, and shopping can be valued at the price someone could be paid to do it. The amount could be set at the usual rate paid for each activity, the average national wage, or the person's own market wage.

Whichever method is chosen to supplement conventional economic accounting, research shows that the unpaid economy is very large. Across Western nations, there is a broad parity of paid and unpaid work time. That is, as many hours are spent in unpaid as in paid work. The ratio of unpaid to paid work is higher in developing nations. Cross-national estimates of what it would cost to pay replacement wages for unpaid work range between 40 and 70% of GDP (OECD 2016). Depending on the wage attributed, the replacement value of family care in the United States has been estimated at \$140 billion, \$257 billion, or \$389 billion a year, and in the United Kingdom estimates have been put at £87 billion a year.

## Unpaid Work and Gender Equity

Costing unpaid work and care in monetary terms is very important, but this approach on its own does not go far enough to understand the gender implications. The social, economic, and personal significance of unpaid work is not only what it is worth in financial terms but also the time involved, and impacts that undertaking this work has on other activities and outcomes. Cross-national comparisons show that time spent in unpaid work and care amount to many hours per day. Gender time gaps are universal. For example, a six-country study compared average minutes per day spent in domestic work (i.e., cooking, cleaning, clothes care, shopping, and childcare) by women and men in Canada (275 vs 140), the United Kingdom (287 vs 146), the United States (281 vs 146), Denmark (232 vs 132), Finland (239 vs 137), and Sweden (288 vs 172) (Gershuny and Sullivan 2003). The study also compared women and men's average minutes per day in paid work time in Canada (331 vs 374), the United Kingdom (316 vs 373), the United States (312 vs 393), Denmark (283 vs 364), Finland (271 vs 343), and Sweden (274 vs 354) (Gershuny and Sullivan 2003). Thus, although national averages varied, in all cases men's average paid work time was higher than women's, and women's average unpaid work

time was higher than men's. Recent data shows this pattern is still ubiquitous and occurs in countries as diverse as Turkey, Japan, and Korea (where men do about a fifth of the unpaid work that women do) and New Zealand and Poland (where men do about half the unpaid work that women do). Gender time gaps are also more pronounced in the global south (OECD 2016).

Such statistics reveal the constraints domestic labor places upon women. It shapes how much time they have available for leisure, for sleep, and for market work. Their circumscribed market opportunities can in turn lower their status and bargaining power within the home. Although in many countries the tradition of women working full time in the home has changed, even in dual full-time earner households, women still average significantly more housework than men. The unequal gender division of labor contributes to gender pay gaps, and in countries in which people save over their (paid) working lifetime for their own retirement income, women are much more likely to be poor in old age than are men. So although women may do more total (paid plus unpaid) work than men, on average they have less money, less wealth, and less economic control and influence. For these reasons, the United Nations Development Programme (UNDP) now includes the balance of paid and unpaid domestic work time between men and women as one of its key development indicators.

## Conclusion

Unpaid work is a productive activity that contributes to the wealth of nations and the economic welfare and well-being of households, but is not remunerated. The magnitude of women's unpaid labor and its invisibility to standard economic accounting and to policy makers are key factors shaping gender inequality. Unpaid work imposes a substantial time impost upon women, which, throughout their life cycle, transfers hidden subsidies to other members of their households, and to markets and governments. Conventional economics obscures the financial and social value of unpaid work, and the time and energy devoted to

it, with highly gendered implications for well-being, and social and economic participation.

## Definition

This entry focuses on gender-based violence committed against women and girls by men, as this

tends to be the more pervasive form of gendered abuse throughout the world. Although it is a complex issue, women and girls often experience violence and suffer its consequences differently than men. Gender-based violence and abuse can take many forms, and all serve to deprive women of their basic human rights via physical force or threatening or intimidating behaviors. Examples of gender-based violence and abuse include: emotional and psychological abuse; physical assault; rape, including in marriage or common-law relationships; verbal harassment or uttering threats; and economic abuse when an abuser prevents a victim from having a paid job or access to financial resources. Gender-based violence can occur at the family or community level, and it is frequently perpetrated by the agents of the state (e.g., border patrols). While most of the international community regards these abuses as human rights violations, states often fail to enact legally enforceable legislation that provides formal protection for women and girls.

There are some commonalities in how women and girls experience gender-based violence in different societies across the world. For instance, women and girls throughout the world have fallen prey to sex traffickers, and their involuntary participation in the sex trade has made them extremely vulnerable to high levels of violence. On the contrary, there are many cross-cultural differences in how women's rights are violated, and different forms of violence are associated with different countries. In democratic societies, in which there are generally high levels of gender equality, the popularity of the Internet as a means of communication has more recently intensified forms of cyberbullying, such as stalking and harassment, through various forms of social media (Facebook, Twitter, text messaging, and other forms of social media).

On the other hand, in some developing countries where gender equality is comparatively nonexistent, millions of girls are killed through infanticide and others are harmed through female genital mutilation. In these countries, gender-based violence often appears to be legitimized as there are few legal consequences for dowry or honor killings, or forcing girls to contribute to

their family's economic survival through prostitution, pornography, or being forced into childhood marriages. Sexual violence may result in reproductive health issues, which include, but are not limited to, sexually transmitted infections (STIs), HIV, unwanted pregnancies, forced abortions or sterilization, lower access to medical care, and nutritional deficiencies during pregnancy. Consequently, the issue of gender-based violence has very often been debated through a public health lens.

Irrespective of the societal or cultural context, the root causes of violence and abuse are thought to be the manifestation of unequal power structures that favor men over women, which are deepened by many other complex social, economic, ethnic, racial, and religious inequities found in patriarchal cultures and political systems. Put differently, gender-based violence is part of an oppressive structure that is used to reinforce women's inferior social status and to ensure their continued subordination to men.

### **Groups Disproportionately Affected by Gender-Based Violence**

Gender-based violence transcends national boundaries, affecting women and girls of all cultures, ages, ethnicities, and socio-economic circumstances around the globe. The World Health Organization (WHO) has estimated that more than one in three women will be subjected to gender-based violence during her lifetime. Women and girls from vulnerable and/or unequal social groups are at a higher risk of violence and abuse, for example, Indigenous women, the elderly, women with disabilities, impoverished women, and immigrant or refugee women who often face isolation due to the language and cultural barriers associated with living in a new country. Likewise, experiences of gender-based violence are equally prevalent among other socially vulnerable groups, such as the LGBTQ2S (lesbian, gay, bisexual, transgendered, queer, and 2-spirited) community whose members are often the victims of verbal abuse or sexual attacks.

In wealthy, democratic countries, gender-based violence is disproportionately high among women and girls from the most disadvantaged social groups. For example, in Canada, Indigenous (First Nation, Métis, and Inuit) women and girls continue to suffer great harm from the intergenerational legacy of state-sponsored residential schools. Dating back to the mid-1800s, residential schools were a colonial experiment that attempted to integrate Indigenous children into the Euro-Canadian culture and education system; during this period, the state forcibly removed many children from their families and communities to place them in these schools. Although the last school closed in the 1990s, the residential school program is responsible for producing irreversible historic trauma, racism, oppression, addictions, loss of identity and way of life, as well as a host of other contemporary issues in Indigenous communities – all root causes of family violence. The harsh reality is that the path to family and community healing from this historical experience is a long one, as many Indigenous women continue to suffer violence and abuse within their households and communities. Added to this national tragedy is the fact that Canada is currently facing a crisis of hundreds of missing and murdered Indigenous women and girls whose demise is likely the result of violent acts against them. However, a further tragedy is how long it has taken the state to take action to address the issue.

While the Canadian example offers a context-specific example of gender-based violence, its defining features are consistent on a broader scale: women from groups with few legal and political rights and limited access to economic resources often experience higher levels of gender-based violence. One contemporary example of institutionally sanctioned violence can be seen in some Middle Eastern and African countries, where women continue to be punished through stoning (i.e., stones are hurled at them until they die) if they are convicted of engaging in extra-marital sex – even if it was the result of a rape.

## **The Legal and Policy Framework Around the Globe**

The legal and policy frameworks of national governments and international agencies, including the United Nations, can play a major role in reducing and ultimately eliminating gender-based violence in any society. In more democratic nations, laws protecting women and the concurrent proliferation of community social services have been relatively recent phenomena; unfortunately, both remain glaringly deficient in much of the developing world. Numerous international gatherings have resulted in declarations, resolutions, and legal and policy frameworks regarding women's rights and the duty of states to provide greater legal protections and services to women and girls. One landmark advancement toward the elimination of gender-based violence came in 1992 at the United Nations Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) wherein gender-based violence was officially articulated by Recommendation 19 as: "...violence that is directed against a woman because she is a woman or that affects women disproportionately."

In 1993, the United Nations Declaration on the Elimination of Violence against Women (DEVAW) expanded the definition of gender-based violence to include any act of violence that "results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or in private life." This declaration was especially significant because it placed individual rights above cultural rights, thus denouncing cultural practices such as female genital mutilation. Since then, the DEVAW's definition has been expanded upon by the 1995 Beijing Platform for Action that was adopted by the Fourth World Conference on Women, and between 2000 and 2013 the United Nations Security Council adopted seven resolutions to form an international Women, Peace, and Security policy framework to protect women in conflict and post-conflict situations. These resolutions specifically addressed the urgent issue of the alarmingly high

occurrence of rape and other forms of sexual violence in conflict regions, most often at the hands of police, border patrols, or refugee camp guards – all of whom are supposed to be agents of the state. Since then, there have been many resolutions and human rights instruments oriented towards dealing with gender-based violence at the regional level; however, the implementation of these resolutions and instruments poses a challenge as no single international institution has the legal authority to compel a nation to honor its international commitment to strengthening its legal framework vis-à-vis gender-based violence. The international community's only recourse is to either try to persuade noncompliant countries with moral arguments or to use shaming tactics.

Thus, there has been much international pressure on governments to acknowledge the rights of women and to take a lead in developing and implementing legislation that addresses gender-based violence and provide preventative measures. In the wealthier and democratic parts of the world, legal discrimination persists (e.g., a lack of enforcement of child maintenance laws) because the formal protections of women and girls are embedded in an imperfect system. Likewise, social services in the form of emergency women's shelters, housing strategies, food security, family counseling, and mediation services still need to be brought to appropriate levels to meet the demand for these services. Although these issues persist, there have been important strides in other areas. For example, there has been an important shift toward innovative programs that engage men and boys in family violence prevention programs, as well as other initiatives that support human rights, such as healthy teen relationships and dating violence programs promoting gender equality.

However, the experience is entirely different for women in more oppressive societies where much violence against women and girls still goes unpunished despite the United Nations' declarations, or the efforts of civil society groups, NGOs (nongovernmental organizations), and women's rights activists to lobby for more protective laws. In many developing countries, gender-based violence tends to be more of a hidden social problem, and cultural attitudes that excuse the perpetrator

from personal responsibility usually result in weak legal sanctions and a lack of safety nets for women and girls experiencing violence. Furthermore, the lack of appropriate services, including preventive programs, is an issue of scale: while NGOs do provide some services, they cannot provide enough of these services to satisfy the demand of those who need them, and those services that they do offer need to be more comprehensive if they are to eliminate violence against women and girls. Nevertheless, gender-based violence is an issue that continues to draw much community-based activism among women worldwide, including the sharing of strategies in best practices in programming, for example, engaging men, empowering women and girls, and strengthening local capacities to provide services.

### **The Economic and Labor Market Consequences of Gender-Based Violence**

Not only is gender-based violence a human rights violation, it also has devastating social, public health, and economic consequences for millions of people living in many different societies. The costs of gender-based violence, which include family violence, provide a compelling argument for state-led policies to address this issue. Some recent studies have examined the costs associated with healthcare services, the criminal and civil justice sectors, social welfare, and personal costs, among others. For example, in Canada, the total economic impact of spousal violence in 2009 was estimated at \$7.4 billion (in Canadian dollars) (Zhang et al. 2012), a sum which is approximately 4% of Canada's total healthcare budget (Canadian Institute for Health Information 2013). In the United Kingdom, the estimated costs of gender-based violence against women in 2012 totaled EUR 28.4 billion, a sum which is almost one-fifth of its healthcare budget (U.K. Office for National Statistics 2015). When these estimates were extrapolated to the other 27 European Union Member states, the costs added up to EUR 225.8 billion (Walby and Olive 2014). In addition, there are likely to be substantial tangible and intangible

costs incurred as a result of the devastating impacts on children witnessing domestic violence, as well as the negative intergenerational effects of family trauma. Another significant economic cost is the lost lifetime productivity when gender-based violence progresses toward murder in an intimate relationship. The WHO has estimated that almost 40% of murdered women globally died at the hands of an intimate partner ((WHO) World Health Organization 2013). The above figures demonstrate that gender-based violence is no longer an issue that only concerns the quality of life of women and girls, but it also has broader economic implications for a given society. Depriving women and girls of their rights not only lowers their economic productivity, but it also denies them the opportunity to fully contribute to their communities and political systems.
